Dock Extensions—In designing dock works, it is expedient to make provision as far as possible for future extensions as the trade of the port increases. Generally this can be effected along side tidal rivers and estuaries by utilizing sites lower down the river or occupying foreshores of an estuary, as was done in the extensions of the ports of Liverpool, Boston, Philadelphia, Savannah and New Orleans. At ports on the seacoasts of tideless seas, it is necessary only to extend the outlying breakwater parallel to the shore line and form additional basins under its shelter, as at Marseilles and Genoa. Quays along rivers also furnish valuable opportunities for extending the accommodations of ports. Inland ports such as those of Manchester, Eng., Houston Tex. and Portland, Ore., convert inland city into a seaport with an exceptionally sheltered harbour. Future extensions in most of these inland ports however, can be undertaken only at the expense of costly reclamation works.

Venice, being situated upon an island of limited area in a lagoon, secured the extension of its dock facilities by the construction of an entirely new port on the adjoining mainland. New

FIG 6 - QUAY WALL NEW YORK CITY 1896

York, in view of the congestion or traffic at the piers in the upper areas of the harbour, developed large districts such as Staten Island and Jamaica bay nearer the sea entrance.

Approach Channels—The accessibility of a port depends upon several factors, such as reefs, submerged ledges, harbour bars, navigation aids and the depth of its approach channel.

The great increase in power and capacity of modern dredges and experience of suction dredges with cutting heads, together with the increasing draught of vessels, resulted in considerable extension of channel depths leading to docks. It is necessary to make due allowance for the possibility of future improvement in the approach channel when determining the depth given to a new dock. On the other hand, there is an economic limit to the deepening of an approach channel depending upon its length, silting conditions and the demand upon the port for deep draught vessels. Any increase in depth is accompanied by a corresponding increase in maintenance cost. On the southern Atlantic seaboard of the U.S. the channels leading to

the river ports, in general, traverse ocean bars near the river mouths which require regular maintenance. The distances from the ocean floor at the channel depth are 8 mi. at Savannah, Ga., 7 mi. at Brunswick, Ga. and 8 mi. at Jacksonville, Fla., while Mobile, Ala., and New Orleans, La., are 30 and 110 mi., respect

FIG 7 - QUAY WALL NEW YORK CITY 1910

tively, from the Gulf of Mexico. In the United States the approach channels are maintained by the federal government.

Tidal Ports—At tidal ports, the maximum available depth for vessels is determined by two standards. In English and European tidal ports the measurement is from high water of the lower neap tide, in U.S. ports, the measurement is referred to mean low tide, which is the average of all low tides on record (usually determined by the U.S. coast and geodetic survey). The period during which docks can be entered at each tide depends upon the nature of the approach channel, the extent of the tidal range and the manner in which the entrance to the docks is effected. Thus where the tidal range is very large as in the Bay of Fundy between Nova Scotia and New Brunswick and at Calais, Me., the approach channels to some of the ports are nearly dry at low water. The tide in Minas basin in the Bay of Fundy is 53 ft., while that at Calais is 20 to 23 ft. It would be impracticable to make these ports accessible near low tide except for small craft, whereas at high water vessels of large draught can enter the docks. Where possible, channels of sufficient depth should be and usually are provided to permit the access of large ships to the docks at all conditions of tide.

In European and British ports, however, where a large range of tides prevails and enclosed tidal basins and docks have been adopted, funnel shaped channels controlled by locks are provided between the entrance jetties or breakwaters and the dock entrances. Examples of this general practice with local modifications are found in Great Britain at King George V dock in the river Thames, the Gladstone dock at Liverpool and at Newport, Cardiff and Avonmouth. At entrance locks adjacent to a swift flowing river the locks and entrance channel are aligned at a small angle with the direction of the stream in order to counteract the tendency of large ships to get crosswise of the current.

Emergency Entrances—It is desirable though not always practical for economic reasons that a wet dock controlled by locks be provided with some alternate means of access. If there is no such provision a serious accident to the one lock or entrance might close it to traffic for a time and prevent ships already in the dock from leaving. In most of the Liverpool and London docks this risk is met by the construction of communication passages between adjoining docks so that in the event any lock or basin entrance is out of operation, some alternative entrance in another dock can

be utilized. Moreover, in busy and important docks, the building of an alternative entrance is often necessary for traffic reasons if delay to ships entering and leaving is to be avoided. It may be noted that the plans for the Gladstone wet dock provided for the future building of an entrance alongside the deep lock and of the same width (fig. 3).

At Le Havre and many other ports, a pair of gates in a tidal entrance alongside the main lock allows ships to enter and leave at high water if the lock is not working. At Barry (Wales) dock, the basin entrance is available if the lock cannot be used, and at Rosyth (Scott.) dockyard an emergency entrance closed by a sliding caisson is built alongside the entrance lock.

Dimensions of Dock Entrances and Locks.—The size of vessels which a port can admit depends upon the depth and width of the entrance to the docks, for, though the access of vessels is also governed by the depth of the approach channel, this channel is often capable of being further deepened by dredging. The solid structures of the dock entrance, on the other hand, cannot be adapted to the increasing dimensions of vessels except by trouble, some and costly works sometimes amounting to reconstruction, as carried out at some of the London docks.

The width and depth of access to wet docks are in one way or more important than the length of locks. For gate entrances and also locks if both pairs of gates are opened at high water, impose no limitation as regards length on ships entering or leaving. This factor is of importance in the working of some old docks whose locks are of limited length but of ample width. It is, however, usual in modern dock construction to make a lock amply long for any ship whose beam or draught is not too large for the limiting dimensions of its entrance.

Open basins are generally given an ample width of entrance, and river quays are also always accessible to the longest and broadest ships which can navigate the channel leading to them. In a tidal port or river, however, the available depth in the berths has to be determined from the lowest low water of spring tides, instead of from the lowest high water of neap tides, if the vessels in the open basins and alongside river quays are to be always afloat.

Table I shows the controlling dimensions of typical docks and locks.

TABLE I—Dimensions of Typical Docks and Locks

Port	Name	Depth in dock at minimum water level	Locks			
			Depth on outer sill		Available	
			High water neaps	Low water springs	Length	Width
		ft	ft	ft	ft	ft
Cardiff	Queen Alexandra	40	12	5	850	90
Avonmouth	Royal Edward	30	35	4	875	200
Swansea	King's dock	20	37½	12½	875	90
Le Havre	Florida lock	40	35	17	865	98½
Hull	King George	32	37	31½	750	85
Newport	Alexandra	33	31	7	700	100
Monmouth	South	33	38½	91½	710	100
Bombay	Alexandra	38½	50	37½	850	108*
Rosyth	Duckyard lock	38	38½	26	700	112*
	Emergency entrance					
London	King George V	33	41½	25	800†	100

*At level of high water of neap tides.

†Can be increased to 910 ft if necessary by use of caisson at inner end.

Tideless Seas.—Ports on tideless seas have to be placed where deep water approaches the shore and, if possible, where there is an absence of littoral drift. The basins of such ports are always accessible for vessels of the draught they provide for, but they require efficient protection and, unlike tidal ports, they are not able on exceptional occasions to admit a vessel of larger draught than the basins have been formed to accommodate.

Inland Ports.—Numerous U.S. ports situated on tidal rivers such as Brunswick, Houston and Savannah derive access to the sea by river channels which, although subject to habitual silting, are kept free for navigation by periodic dredging. In such cases,

FIG. 8—TILBURY DOCKS, PORT OF LONDON, 1929

sheltered open basins are maintained at intervals for manoeuvring of ships. An outstanding example of a river port is the Great Lakes port of Cleveland, where ore boats up to 600 ft in length negotiate tortuous bends in the river and continuous passage is accomplished despite numerous movable bridges. Because of the narrow confines of the river banks, numerous turning basins are provided by suitable quay wall construction and dredging.

DESIGN AND CONSTRUCTION OF DOCKS

Docks should be designed to provide maximum facility in the movement of ships, their cargoes and passengers. Many factors are involved, including such economic considerations as the immediate demand, probable growth of commerce and industry in the vicinity and the financial feasibility of the undertaking. The location should be co-ordinated with existing related facilities such as adjacent docks, highways, rail and air transport accommodations for freight and passengers. It also should conform to established comprehensive port and regional planning. Transit sheds and warehouses should have ready access to transportation facilities.

The physical characteristics of the site, the geological formations of the harbour bottom and its contours—whether of silt, sand, clay or rock—dictate the extent to which the site may be utilized. Borings and samplings of underlying soils afford a basis of evaluating foundation conditions and determining the form of construction to be adopted. Numerous failures of dock structures are of the nature of soil failures which could have been avoided by a better understanding of the behaviour of underlying soils such as is afforded by authoritative investigations of site conditions.

Aside from determining the dimensions of approaches, locks and entrances, the design of docks is concerned particularly with the enclosing shore structures. They embrace, in general, piers, wharves, quay walls and an imposing variety of cargo handling facilities, warehouses and utilities. Except where the related structures rest on independent foundations, their stability depends upon the strength and reliability of their quay walls. Numerous failures of dock walls have been accompanied by earth slides which could have been the cause or the effect of the failure, according to the character of the subsoil and the conditions of loading. The cause in the case of a deep-seated slide and the effect if limited to approximately the depth of the wall.

Even though dock walls may be of proper dimensions to with-

stand the combined pressures of free and normal surcharge the underlying soil may be so compressible that it will consolidate under the superimposed load causing the wall to settle or overturn. The overturning effect is a result of greater movement at the toe where the bearing pressure is greatest. Early warning of such movement indicated by misalignment at the top of the wall,

FIG 9—QUAY WALL SAVANNAH GA 1942

suggests remedial measures before the condition becomes irreparable. A notable example of such visible movement occurred at Chelmer creek in Boston harbour in 1910. The quay wall continued in limited use without alarming symptoms until loaded with a high embankment of coal which caused its complete destruction in 1930.

The variant and often indeterminate factors which enter into the design of docks are so numerous that rarely are there two situations alike. The design should be based upon a thorough examination of the site and subsoil exploration with tests on soil samples for permeability and compressibility.

The structural design of docks is governed not only by the physical limitations of the site and its exposure to the elements but also by numerous operating factors among which are (1) size of ship to be accommodated, (2) extent of cargo storage needed, (3) means of transportation, and (4) loads to be imposed upon the structure by operating conditions.

Construction.—Numerous types of quay walls have evolved through the centuries, depending on materials available, depth of water alongside, progressive growth in size of ships and cargoes and economic use of labour and construction materials. Ancient massive masonry structures were replaced in modern times with open structures and steel sheet pile installations which substituted mechanical power for former mass labour concentrations. The quay walls ranged from hand placed stone on soft silt or clay bottom, supplemented by successive courses of stone as the walls settled, to modern walls supported by deep foundations penetrating the soft strata on hard bottoms. Typical examples showing the evolution of modern quay walls from 1895 to 1948 are shown in figs 4 to 10, inclusive.

Up to the last quarter of the 19th century masonry construction was adopted for the large majority of dock works such as quay walls and locks, and hydraulic lime to a limited extent filled the place later occupied by portland cement. The use of portland cement concrete for all kinds of port construction became almost universal, and its cheapness in comparison with the cost of dressed stone in the large majority of situations restricted the employment of the latter to such purposes as copings and sills and altar courses

in dry docks. Practically all naval docks built prior to 1905 were faced either throughout or on all finished surfaces with dressed stone usually granite. In the few exceptions however, the quay and dock walls were built of and faced with concrete, dressed granite being used only for copings, quoins, sills and similar work.

Reinforced concrete was first used in building jetties, wharves and other dock works about 1895, and its employment thereafter became general. In considerable measure it superseded timber in the building of open wharves, particularly in waters where marine borers such as the teredo and *Limnoria* are present. Rapid setting aluminous cement came into use on the continent of Europe about 1920 and its employment in Great Britain extended rapidly. Pozzuolana and trass cements also are employed widely, usually in combination with portland cement.

Excavations for Docks.—When a dock has to be made on land the excavation is performed by power driven shovels or excavators, employed in preference to hand labour. For large excavations in light soil aerial dragline excavators and various forms of mechanical loaders and conveyors have found economic application. Frequently a large part of the interior excavation of a wet dock or basin is left to be dredged away by floating dredgers or grab buckets after the walls of the dock have been completed and water has been admitted to the area.

FIG 10—MARGINAL WHARF APRRA HARBOUR GUAM 1948

It is occasionally necessary to construct the lowest portions of dock walls with the water excluded by pumping from suction pits below the foundation level. A method of draining such working area is introduced in the Netherlands and Belgium was to sink filter wells at points outside the area which lowered the normal water level by pumping. Its more modern application, known as the

well point system, comprising perforated pipes connected in groups to one or more pumps, has been universally employed

In many cases a cofferdam has to be constructed, cutting off the entrance works from the river or harbour water. The coffer dam is removed when the works built within it have been completed. Where a dock is constructed partially or wholly on re-

FIG 11—VITTORIO EMANUELE III BASIN QUAY WALLS AT GENOA, IT

claimed land, a reclamation bank closing the site and excluding the tide is frequently employed to avoid the use of the more costly sheet pile cofferdam

In some cases, however, the wall forming the outer boundary of the dock has been built without extensive excavation by sinking concrete monoliths from temporary staging erected on the foreshore or sea bed (see fig 11). This plan was adopted to a partial extent in building the enclosing wall of Queen's dock on the Clyde in 1877, Rothesay (Scot) dock in 1904 and Rosyth dockyard basin (1909-15)

DOCK WALLS

Prior to 1900 docks and open basins usually were flanked either by solid upright walls or by wharves of open construction projecting seaward from the quay

The nature of the strata to be excavated and on which the walls are to be founded is ascertained by trial borings and, when practicable, by sinking trial pits. The nature of the foundation has an important bearing on the design of the wall and its method of construction. Ordinarily hard clay (such as boulder clay), compact gravel and sand, as well as most rocks, form excellent foundations. In these cases it is usually unnecessary to carry the base of the wall more than a few feet below the dock bottom, as indicated in fig 12. In less satisfactory ground, such as slippery clay and alluvial material and sand charged with water, however, the foundations may have to be carried down to a considerable depth and the base width increased. Timber bearing piles are sometimes driven to form a foundation for a wall. In other cases a trench has been dredged in the soft material along the line of wall and filled with ballast or stone or even coarse sand to improve the natural foundation.

In U.S. harbours along the Atlantic seaboard, where marine borers have not been prevalent, timber pile foundations upon which timber superstructures are built have been widely adopted. Examples of such timber quays are illustrated in fig 13. The circled letters in the figure refer to the following brief descriptions:

- A Garrison Avenue, Bronx river, New York city. Front coiled piling filled with riprap
- B Harlem river, New York city. Three-inch sheet piling backed with riprap. Anchor bents ten foot centres
- C Echo bay, New Rochelle, N.Y. Close piling backed with riprap. Bents 6 ft 6 in on centres
- D Oak Point, N.Y.
- E Hudson river, New York city. Riprap embankment. Bents of platform ten feet on centres
- F Astoria, I., N.Y., Astoria Light and Power Co. Crib filled with rubble pockets eight feet square formed by logs
- G Hudson river, New York city, Interborough Rapid Transit Co.

Slope paved with tiprap. Bents five foot centres

H Harlem river, 171st street, New York city. Four inch sheet piling, backfilled with riprap. Guide piles five-foot centres, two anchor piles every ten-foot

I Rockaway inlet, Barren Island, New York city. Bents ten foot centres, one brace pile to each

J San Pedro, port of Los Angeles, Calif. Live load allowed 500 lb per square foot. Piles creosoted bents 15-ft centres

K Missouri river, Kansas City, Mo. Timber and piles creosoted 526 ft long

L Chicago, Ill., sanitary district. Standard sheet pile bulkhead

M New York, navy yard, 1912. Platform with six-inch sheet piling

In many cases the firm foundation or rock bottom occurs at slight depth below the channel bottom, precluding the further driving of wood piles. This difficulty has been met by depositing riprap or large random rock to depth sufficient to provide the necessary support to the pile structure and by employing a combination of masonry, concrete and timber designs as indicated in fig 14. The key letters of fig 14 refer to the following specific locations and details

A Savannah, Ga. Twelve-inch reinforced-concrete wall on timber piles, 15 ft 6 in on centres, reinforced concrete deck slab. Live load 600 lb

B Brooklyn, N.Y., Gowanus canal. Timber platform, with concrete wall on piles and riprap

C Chicago, Ill. Plan for bulkhead wall alongside long pier

D San Diego, Calif. 2,675 ft long. Concrete-incaised piles on seven-foot centres

E Honolulu, Hawaii. Cylinders on 12 ft centres. Reinforced concrete on timber piles

F Chicago, Ill. Long pier bulkhead

G Charleston, S.C. 4,000 ft long. Untreated timber piles, sheet piling and concrete wall. Reinforced concrete sheet piling, three feet wide, to protect timber work from marine borers

H New York (South Brooklyn), N.Y. One of several types of wall used by department of docks and ferries

I Boston, Mass., Northern avenue, Commonwealth pier. Length 645 ft

J Schenectady, N.Y., New York State Barge canal

K Amsterdam, N.Y., New York State Barge canal

L Utica, N.Y., New York State Barge canal

M Providence, R.I., Field's point. Bents four-foot centres, two brace piles to each bent. Sheet piling six inches and eight inches

N New York, N.Y., Central Railroad Company of New Jersey, Bronx terminal. Bents eight foot centres, two brace piles to a bent, sheeting six inches

O Norfolk, Va., U.S. navy yard. Timber platform surmounted by concrete wall on reinforced concrete sheet piling, 55 ft long. Similar wall faced with granite ashlar, built at New York navy yard. Bents 5 foot centres

P New York, Pol., commercial railroad

Q Berlin, Ger., Spree canal

R Boston, Mass., U.S. navy yard

In locations where rock is encountered at moderate depths and where marine borers are active, recourse is taken to a combination of masonry blocks, reinforced concrete and riprap construction as illustrated in fig 15 by reference letters which indicate the following essential details

A Key West, Fla., U.S. navy yard. Reinforced concrete piles and deck. Bents ten-foot centres

B Albany, N.Y., New York State Barge canal

C Los Angeles, Calif. Reinforced concrete piles and deck. Bents 20 ft centres, anchors, four vertical, four brace timber piles

D Nantes, Fr., on Loire. Reinforced concrete

E Spandau, Ger., municipal quay

F Nantes, Fr.

L New York, N.Y., 116th street, department of docks and ferries
 M New York, N.Y., Cedar street, department of docks and ferries
 The walls around a dock serve as retaining walls, and although they have the support of the water in front of them when the docks are in use, when built in the dry they sustain the full pressure of the filling at the back, as well as any surcharge caused by erections on the quay. The completion of the filling behind the wall is thus sometimes deferred until after the dock is filled with water.

The thickness of solid dock walls is increased downward to support the pressure which increases with the depth. This pressure depends on the nature and angle of repose or natural slope of the ground and filling material behind the wall. But the pressure is often increased by the accumulation of water at the back, which, with fine, silty material, exerts a sort of fluid pressure against the wall proportionate to the density of the mixture of silt and water. Thickness toward the base formerly was increased by a batter on the face, as well as by stepping the back. The vertical form given to the sides of later ships however necessitated a corresponding vertical or nearly vertical face for the wall.

The height of a wall above the dock bottom depends upon the minimum depth of water needed for vessels and upon the rise of the tide. In tideless seaports and inland ports removed from tidal influence, the height is represented by the minimum depth of water plus a margin of from six to ten feet from the water level to the quay surface. At tidal ports however, an addition has to be made equal to the difference in height between the highest and lowest water levels in the dock or in the open basin as the case may be. At some ports, such as Montreal, Cleveland, Pittsburgh and Portland, Ore., provision against river floods and seasonal stages necessitates especially high coping levels.

Except under the limiting conditions where steel sheet piling can be carried up safely to the grade of the finished wharf, dock walls are constructed of masonry, brickwork, or concrete or of concrete with a facing of stone or brick. Most later dock wall building has been in concrete, and, when suitable materials are available at or near the site of the work, concrete construction is usually cheaper than any other form. Where subsols afford adequate bearing value, the foundations for dock walls, below the level at which open excavation is practicable and economical, are excavated in a trench. The trench is lined with timber sheeting for the support of the sides during excavation and in dry ground and very deep trenches, timber sheet piling or interlocked steel sheet piles are driven to form the sides. Examples of dock walls built in trenches are shown in figs. 16 and 17.

The walls of open basins are often constructed in the dry precisely like dock walls. They differ from dock walls only in being exposed to variations in the pressure at the back resulting from the lowering of the water level in front. If mass concrete walls are to be built in the dry, some form of cofferdam is necessary when the site is covered by water, steel sheet piling is commonly employed for the purpose of enclosing the area to be excavated.

Concrete Block Walls—In the construction of the quay walls lining the basins formed in the harbour at Marseilles, large concrete blocks were deposited on a rubble foundation till they reached sea level. Upon these blocks a solid masonry wall was extended to quay level. This practice was widely followed, particularly in Mediterranean ports, and the size of blocks employed progressively increased. As early as 1871, blocks weighing 360 tons are said to have been used in the construction of quay wall in the port of Dublin. Each block formed a complete section of the lower part of the wall, 12 ft long and 27 ft high, and was lifted from the staging on which it was made and deposited under water by floating derricks. An alternate method was employed in the breakwater at Aberdeen harbour, in which canvas bags were laid in a hopper barge and there filled with concrete, sewn up and dropped through the door in the bottom of the barge onto the foundation. Sloping blocks were used early in the construction of a quay wall

at Mormugao Portuguese India and were erected on a foundation layer of rubble to provide against unequal settlement on the soft bottom. The system was employed often thereafter. Later examples are the quay walls of Valparaíso, Chile, and Kilindini (Mombasa, Kenya) harbours.

FIG 16—SOUTHAMPTON ENG OCEAN DOCK SECTION OF QUAY WALL BUILT IN THE DRY IN TIMBERED TRENCH

Representative designs of concrete block walls are shown in figs. 11 and 17.

Well Monoliths—Brief mention has been made of well monoliths as an alternative for excavation of docks (see also fig. 18). In some instances where dock walls have been constructed on ground above the water line or within an enclosing embankment or cofferdam, the subsoil strata has been of such unpredictable nature that the monolith method has been adopted to penetrate unstable soils. Its principle is derived from the ancient Indian system of well sinking. The cylindrical well foundations built up around iron- or steel framed curbs forming cutting edges were sunk by excavating from within with grab buckets. These single cylinders arranged in groups of three formed a foundation unit in Queen's dock, on the Clyde in 1877. The rectangular form with four to six cells was later adopted as being more easily adjusted against a tendency to tilt from the vertical. In this case it was necessary only to excavate from one or another of the cells to assure stability.

Similar monoliths were employed at Tilbury in building the walls of the main dock extension (fig. 19) and at Calcutta (1928) where the soil is alluvial and very soft. At Rosyth some of the monoliths sunk for forming the outer walls of the dock were carried down to a depth of 121 ft below the coping before a

FIG 17—QUAY WALLS AT ALGIERS

sound foundation was reached. The well spaces were sealed with concrete at the bottom. In some cases the wells are entirely filled with concrete, while in others sand filling is used above the concrete seal. At Karachi, Pak., and Southampton (1933-34), the front wells were filled only partially to reduce the intensity of pressure on the foundations at the toe of the wall.

A wide variety of foundation materials, including pipe piles, drilled in caissons, concrete piles, circular steel sheet pile cells, cast-

iron and concrete box caissons the latter evolved from the early idea of the monoliths, have been used. Their applications are variously suited to the particular conditions encountered and are usually governed by the factors of available supply and relative cost. Numerous combinations of these materials have been employed according to the severity of the conditions.

Of the numerous construction methods successfully employed, the following three are generally recognized as fundamental. Other methods adopted involve variations or combinations of these:

1 Direct driving of large pipes or cylinders, excavating from within and replacing with suitable bearing material. Pipe piles have been driven to a depth as low as 183 ft below tide water.

2 The sinking of floating caissons by progressive adding masonry, rubble stone, or concrete to the structure as it sinks into position.

3 The sinking of open caissons with cutting edges at their bases by the pneumatic method. This method is used where it is desirable to observe the foundation conditions to place the concrete bottom under dry conditions and to avoid disturbance of adjacent structures. Dry working conditions are obtained in a watertight chamber under compressed air.

The construction of a large number of piers for the Central Railroad Company of New Jersey over Newark bay was an adaptation of the open caisson method, in which the caisson was sunk to rest on a prepared foundation of timber piles 77 ft 10 in below mean high water. The pneumatic method is widely used for the foundations of bridges, dams and piers where heavy load concentrations occur. Its practical and economic limit as to depth is 90 to 110 ft.

Sinking by Compressed Air.—Early use of compressed air has been noted in advancing the foundations of quay walls, through alluvial deposits, to solid strata. About 1880 the building of a long line of river quays extending out into the Scheldt was begun at Antwerp, Belg., with the object of regulating the width of the river simultaneously with the provision of deep water quays. The wall was built, out of water, on the flat tops of a series of wrought-iron caissons, 82 ft long and 29½ ft wide, constructed on shore. These were floated out, one by one, between two barges, and gradually lowered as the wall was built up inside a plate iron enclosure erected around the foot of the caisson. Each caisson eventually was sunk by aid of compressed air through the bed of the river to a compact stratum. An extension of the wall carried out in a somewhat similar manner was completed in 1903 (fig. 20).

A dry dock and quay walls constructed in the old harbour at Genoa about 1888 were founded under water in a similar manner by the aid of compressed air. Part of the Broomielaw quay at Glasgow was reconstructed about 1902 on steel caissons carried down by means of compressed air from 54 to 70 ft below quay level. A deep water tidal quay at Le Havre was built upon steel caissons about 141 ft long and 45 ft wide sunk by compressed air through about 57 ft of soil. The wall was constructed of masonry and concrete within temporary caissons raised upon the tops of the permanent caissons, which terminate at the level of the dredged berth more than 40 ft below low water (fig. 21). Compressed air was also employed at Marseilles (fig. 22) for building quay wall foundations.

Quay Walls of Timber Crib Work.—In some North American ports, where firm foundations occur relatively close to the low water datum, walls have been built of timber crib work, sunk in a previously dredged trench or placed directly on a hard bottom. The cribs extended to the elevation at low water and were filled with rubble stone. Above low water mass concrete or masonry walls were raised in the dry on the crib foundation. Examples of these cribbed quay walls, which withstood the ravages of wind,

tide and scour, are found at Montreal, Saint John, N.B., some of the Great Lakes ports, the port of Philadelphia and the harbour of Portland, Me. While they are particularly well adapted to exposed locations and rocky shores where wind and tide extract a heavy toll on lighter structures, they are by no means the answer to unusually violent storms such as that which occurred in the harbour of Wick, Scot., in 1872. This harbour had been rebuilt in 1808 of massive masonry construction. In the storm of 1872 the mammoth waves tore away a section of concrete breakwater weighing 1,350 tons, lifted it and deposited it in a mass inside the harbour. Subsequently investigators estimated the force of the wave to be more than two tons per square foot.

A tropical typhoon on the island of Guam in 1946 generated waves which overtopped the breakwater about 50 ft above average sea level. Gaps were left in the structure which necessitated widening the breakwater and extending its height.

The economic factors of providing for such unusual occasions whether at 10 year or 100 year intervals, and the cost of maintaining excess stability throughout the period must always be considered. Because of the relatively permanent requirements of water front structures, solid masonry is preferable where construction cost is not prohibitive.

Reinforced Concrete Caissons.—After 1905 reinforced concrete caissons with closed bottoms were frequently used in the construction of quay walls, as at President Wilson basin in Marseilles (fig. 22). The caissons were constructed on shore, in a dry dock, or in some position from which they could be launched or lifted by giant cranes and towed into position. After being sunk to their final positions on a prepared bed of rubble or concrete, their filling was completed with sand, stone or concrete to suit the foundation conditions and the requirements of their superstructures.

TABLE II—Typical Applications of the Floating Caisson to Dock and Harbour Installations

Floating caissons were employed also in the construction of breakwaters at Bilbao, Sp., Bizerte, Tunisia, Algoma, Wis., Welland Ship canal, Ontario, Flushing creek, Long Island, Newark bay, and at ports on Lake Michigan.

Because of its monolithic character and low cost of fabrication, reinforced concrete has many advantages over stone masonry construction for harbour works. A spectacular military example

FIG. 19—TILBURY DOCK WALL SHOWING CONCRETE WELL MONOLITH

of its numerous applications was the building of mammoth caissons in England which were towed across the channel in 1944 to the Normandy coast of France and assembled as units of a prefabricated harbour by Allied military forces. Emergency quays thereby provided landing facilities for military equipment and stores in a matter of months, in contrast with a construction period measured in years under former procedures. Each of the caissons was about 204 ft long, 44 ft wide and 40 ft high—a hollow box with

cross walls and a longitudinal wall on the centre line. Each contained about 1 712 cu yd of concrete and 178 tons of reinforcing steel.

Two of these caissons, known as Phoenixes, which were incorporated in the artificial harbours for the Normandy landings were

FIG 20—SECTION OF QUAY WALL IN THE RIVER SCHELDT, ANTWERP, BELG. FOUNDED ON CAISSONS SUNK BY COMPRESSED AIR

purchased from Great Britain in 1951 and towed to Stockholm, Sweden, there they were placed end to end to form a pier in the oil harbour of the port.

Quay Walls on Piled Foundations.—From the latter part of the 19th century, the massive masonry structures employed in quay wall construction gave way to lighter structures composed of piles driven through soft strata to more stable bottom and surmounted by timber or concrete platforms extending approximately to mean low water. Upon these platforms much lighter masonry or concrete walls were erected to retain the fill. Timber piles were used generally in earlier constructions until the development of steel rolled sections, iron pipe piles and concrete piles. Concrete piles or steel piles or a combination of the two, were preferred in waters where marine borers were prevalent.

With the advent of steel sheet piles about 1905, and subsequent rolling of heavier sections capable of sustaining usual quay wall loads, quay wall design was materially modified.

Timber sheet piling had been employed to a considerable extent for retaining the fill behind open pile constructions. Steel sheet piling, however, introduced a new era in dock building. After 1930, steel sheet pile bulkheads in various forms answered the requirements of most quay wall design. In borderline cases, where the induced stresses approached the allowable strength of steel sheet piles, riprap slopes were introduced to relieve the stresses in the piles. As the depth of water in the docks increased to accommodate larger ships various modifications of the sheet pile bulkhead walls became necessary. The most general of these was the relieving platform built of timber or concrete at about the elevation of mean low water. In some instances, where steel sheet piles were in short supply recourse to the use of concrete sheet piles was taken, as in New York in 1910. Typical examples of progressive development in this modern type of construction are shown in figs 4 to 10, inclusive.

Where highly compressible and unstable soils are encountered at great depth, the so called cofferdam type of construction has

been adopted, consisting primarily of circular cells built up of straight web, steel sheet pile sections. Later designs combined the idea of circular sections with adjacent cell sections formed by straight diaphragms between the cells connected by circular arcs between diaphragms. In some cases the cells penetrated the soft and unstable soils to depths of more than 100 ft and extended to the finished grade of the wharf. In most cases, however, they terminated at about mean low water and were surmounted by concrete gravity walls of adequate dimensions to retain the fill behind the walls. An example of this type of construction is a marginal wharf built at Apra harbour, Guam in 1948 (fig. 10). Other notable examples are the ore loading wharf on the Cuvvuhoga river at Cleveland on the Willamette river at Portland, Ore. and the quay wall at Sparrows Point, Md.

Failures of Quay Walls.—Failure of quay walls may be due to any one of several circumstances among which are the following: faulty design which ignores not only well known principles of the behaviour of soils under stress but also the choice of construction materials best suited to the location, inadequate knowledge of the underlying strata, failure of the builder to observe safe practice in construction procedure, loading the structure beyond the limit for which it is designed, and subsequent dredging in front of the wall beyond the depth originally intended. Many failures occur during construction while others are not observed until after completion of the structure. Partial failures usually are detected first by visual evidence of misalignment of the top of the wall, generally accompanied by settlement. They are usually progressive. Where they have been observed in their early stages, successful remedial measures have been taken, but when allowed to progress, the sea walls have required complete reconstruction.

In the case of massive masonry walls of the gravity type resting on natural soil foundation the movement has usually been a sliding action on its base.

The following typical examples of quay wall failures and some of the corrective measures applied were compiled by Adm. Fred Eric R. Harris for the *American Civil Engineers' Handbook*, T. Merriman and T. H. Wiggan (eds.), 5th ed. (John Wiley & Sons).

1. An outward movement was observed during the construction of the Fish pier wall in Boston harbour, the wall resting on an inclined riprap bed, laid on clay overlying hardpan and rock. The movement was arrested by driving piles directly in front of and at the toe of the wall and constructing in the rear of the wall a relieving platform. About 400 ft of wall were involved.

2. A section about 200 ft long of a masonry and timber platform wall built at the New York navy yard failed by outward movement

FIG 21—SECTION OF TIDAL QUAY AT LE HAVRE, FR. FOUNDATIONS WERE CONSTRUCTED WITHIN PERMANENT CAISSONS EACH 141 FT LONG AND THE UPPER PART OF THE CAISSON REMOVED

and overturning, the cause being, undoubtedly, improper brace pile connections.

3. A somewhat similar wall in Washington, D.C., built on a very narrow platform without brace pile ties, moved outward ten feet when the backfilling had been carried only to mean tide elevation. When brace piles, backfilling was carried to grade and no further movement of importance was found.

FIG 22—PRESIDENT WILSON BASIN MARSEILLES FR QUAY WALL OF CONCRETE CAISSONS ON DISCONTINUOUS CONCRETE FOUNDATIONS IN DEEP WATER

4 A wall in Charleston, S.C., harbour, 4,000 ft long was located on a salt marsh the water sill of increasing compactness and density extended to a depth in excess of 90 ft below tide. The depth of water at the face of the wall varied from 14 ft to approximately 18 ft. The support for the wall consisted of a timber platform and brice piles with sheet piling driven at an inclination. Filling of river silt was placed behind the wall by hydraulic dredging. In two locations the filling material blew out underneath the sheet piling pushing out the bottom of the sheet piling. This was corrected by loading the toe of the wall with riprap and, in some instances, by driving heavy vertical sheet piling inside and behind the wall platform.

5 A platform bulkhead built in New York harbour, consisting of a timber platform with sheet piling on the inside with brace piles at 5-ft intervals, with 15 ft depth of water at the sheet piling and 30 ft depth along the face, gave evidence of outward movement when the depth of water was increased by dredging to 44 ft. This was corrected by placing two inch round steel anchors every 10 ft and carrying these back 40 ft inshore of the sheet piling to anchors of timbers, deadmen and piles, and placing riprap along the slope decreasing the depth of water at sheet piling to 12 ft.

6 A wall built at the navy yard in New York, about 1885, of gravity type, consisted of heavy granite blocks with massive counterforts, laid by divers on a timberwork above tide level. It was designed at a time when the draught of the vessels did not exceed 20 ft. With the increase of draught of vessels, the basin directly in front of this wall was dredged out, finally, to a depth slightly in excess of 30 ft. A somewhat similar wall in another locality failed by outward movement and overturning. The wall in question moved outward and gave every indication of early failure. It was repaired by stopping off the ashlar work to low water, driving sheet piling directly in front of the wall and using this back in turn by timber ties to a platform behind the wall provided with vertical brace piles, filling the space between the face of the wall and the sheet piling with riprap, building a new wall directly on top of the sheet piling and backfilling the work.

7 A crib in the Delaware, Lackawanna and Western Railroad Co. yard, Hoboken, N.J., the top of which had given way and needed renewal, was repaired by constructing a concrete wall carried down to a level where the crib was still sound.

8 A sea wall built on a timber platform, the protective face of which under water consisted of three lap, two inch yellow pine treated with creosote, began to fail because of the destruction of the wood by the teredo. Eight-inch grooved and tongued reinforced concrete sheet piles were driven and a reinforced-concrete face put on top of this and the structure tied back by the rods.

ENTRANCES AND LOCKS

Gate Entrances.—Entrances with a single pair of gates closed against a raised sill at the bottom and meeting in the centre have to be made long enough to provide a recess behind the gate on each side wall to accommodate the gates when they are open and to form an abutment in front to bear the thrust of the gates when closed against a head of water in the dock. A masonry or concrete floor is laid on the bottom in accommodation of the sill serving as an apron against erosion. Entrances have the advantage of occupying less room than locks, and they are less costly. They have the important disadvantage of being accessible for a limited period only on each side. They have seldom been included except as auxiliary passages in the construction of large new docks.

Locks.—Locks differ from entrances in having a pair of gates

at each end of a lock chamber. Dock locks are similar in principle to those on canals. The lock chamber has its water level raised or lowered when gates are closed at both ends by passing water through large sluiceways or culverts in the side walls. In most large modern locks, an intermediate pair of gates is provided in the chamber in order to divide the lock for the accommodation of small vessels.

Inner and outer sills of dock locks are frequently constructed at the same level, the advantage in the case of two or more pairs of gates is that they may be interchangeable.

The foundation for sills, side walls and floors of a lock generally are constructed in cofferdams built across the entrance channel in which the excavations are kept dry by pumping. Under the sill and adjacent to the sills the foundations usually are carried to a lower level and, if possible, to an impervious stratum to prevent the infiltration of water under pressure. Frequently, sheet piling is driven across the lock site and under the side walls to cut off the flow of water. A physical concave recess is formed in the walls in which the heel post of the gate turns.

The side walls of a lock chamber are very similar in construction to dock walls. They are usually built of concrete and have been frequently in the form of an inverted arc which resists any forward movement of the adjacent wall, the toe of which abuts against it.

A feature in the design of modern locks and entrances is the rectangular form of the entrance corresponding to the shape of the midsection of modern ships. Some of the earlier entrances were constructed with inverted arc floors, the depth being greater at the centre than at the sides. In soft alluvial soil, the use of well monoliths in the foundations was found advantageous at King George dock, Calcutta, and at Tilbury (1938). Large caissons were employed for constructing under compressed air the foundation of gate chambers, lock heads and portions of the side walls of the Florida lock at Le Havre. The large lock at New Orleans, La., built in fine quicksand was supported on 24,000 piles.

The entrance lock at Ymuden, Neth., opened in 1930 is a concrete structure resting on concrete piles. The lock has a floor of reinforced concrete under and near caisson sills, but in the main chamber the canal bed is left uncovered between side walls, the

FIG 23—TIMBER DOCK GATES ALEXANDRIA DOCK HULL ENG

foundations are enclosed in sheet piling. The lock was built on fine water logged sand the excavations being kept dry by means of a well point system. In a few other cases, including one of the large docks at Bremerhaven, Ger., an artificial floor was avoided except at the ends of the lock chamber.

DOCK GATES AND CAISSONS

The entrances and locks at wet docks and the entrances at dry docks are closed either by gates or caissons. Gates formerly were built of timber, greenheart generally being used when obtainable. Until about 1915 practically all the gates of Liverpool were so constructed even for such a wide opening as 100 ft. at the Canada lock. The difficulty of obtaining very large greenheart timbers and its high cost, plus the convenience and economy of steel construction, resulted in almost universal use of mild steel for gate building. During the second half of the 19th century, many gates were built of wrought iron until the general adoption of mild steel for construction purposes superseded it. In steel gates the heelpost (*i.e.*, the vertical closing piece at the hinged end) the mitre post at the meeting end and the sill piece which close against the fixed sill of the gate timber are all usually built of greenheart or faced with it.

Wooden gates consist of a series of horizontal framed beams made thicker and placed closer toward the bottom to resist water pressure which increases with the depth. The beams are framed and fastened to the steel posts and mitre posts at the ends, and there are usually intermediate uprights. Watertight planking is fixed on the pressure face.

Steel gates usually have both an outer and inner skin of plating braced vertically and horizontally by steel plate ribs and girders. They are frequently built with buoyancy chambers which relieve the gate anchorage at the head of the heelpost of considerable horizontal stress due to the weight of the gate. The pivot support at its foot likewise is relieved of all weight except that necessary to prevent the gate's floating out of its seat. They are consequently much easier to move in the water than are wooden gates. Wooden gates, however, are less likely to be seriously damaged if rammed by a vessel. All anchorages and supports of a steel gate should be made strong enough to sustain its weight in the event that the buoyancy chambers become waterlogged.

The semibuoyant type of gate generally employed in modern docks dispenses with the roller and roller path under the gate near the mitre posts formerly provided to sustain the weight. The buoyancy of the gate is maintained at a constant value by constructing the buoyancy chamber in the lower part of the gate. All chambers formed by skin plating above the watertight compartment are opened on the outside face to the free flow of the tide. Thus, so long as the buoyancy chamber is submerged, the unbalanced weight remains practically unchanged whatever the depth of water may be. In this way, the unfloat weight of the gate can be reduced to a few tons.

Formerly, dock gates were sometimes made segmental in plan on both faces with the inner face forming a continuous circular arc. The width of the gate leaf at its centre is usually made one-eighth of its length.

Storm gates pointing in the reverse direction to the impounding gates and placed outside them are occasionally employed in entrances subject to extraordinarily high tide or strong wave action. Strut gates are swung into position at the back of the impounding gates to support them against pressure of waves in exposed locations.

Single-leaf semibuoyant gates hinged on a horizontal access below the level of the sill have been employed in several dock entrances. The gate is lowered into the water to open the entrance until it lies flat on a platform or apron outside or below the sill level. The train ferry dock at Dover, opened in 1936, is provided with horizontally hinged gates. As this is a wet dock and is designed to maintain the water surface inside the gate at a level which may be higher or lower than the tidal water outside there are two gates, one behind the other, capable of being lowered in opposite directions.

Sluice Valves.—Valves or sluice gates in various forms are

BY COURTESY OF MESSRS. GLENFIELD AND KENNEY LTD.

FIG. 24.—SLUICE GATE AT CONGELLA DRY DOCK (DURBAN U. OF S. A.) OPERATED BY A 25 H.P. ELECTRIC MOTOR. TOTAL WATER PRESSURE ON THE SLUICE DOOR (EITHER SIDE) IS 170 TONS.

used for controlling the water levels in locks and docks. Valves were formerly built into the gates in some cases but as the volume of water to be dealt with grew larger it became usual to build culverts with controlling gates in the side walls of the lock or entrance. Gate sluices have also continued to be used in some docks for the purpose of sluicing silt deposits from the sill apron. An old form of sluice gate is constructed of timber, usually greenheart, and is raised and lowered over the culvert mouth in the sluice chamber by hand power or electric motor. Cast iron gates faced with gun metal and working against cast iron frames are often employed and are usually similarly operated. A double faced sluice gate at the Congella dry dock, Durban, U. of S. A. is illustrated in fig. 14. Balanced cylindrical sluice valves, in which the water flows between the bottom edge of a steel cylinder and its annular seating when the cylinder is raised, are used in some cases. Roller gate sluices of the Stoney pattern are frequently employed in large culverts as at the locks of the Panama canal, and "butterfly" or balanced flap sluice valves turning about a horizontal axis are occasionally used in culverts of moderate dimensions. Cylindrical and "butterfly" valves both possess the advantage (in that they are balanced or in equilibrium, so far as water pressure is concerned) of eliminating friction at the meeting surfaces. In roller sluices the friction is reduced to insignificant dimensions. All dock sluices operated by electric motors or hydraulic rams should be fitted with means for hand working when necessary. Stop planks for emergency use are often provided in secondary sluice gates.

Gate Machinery.—The early practice was to attach two chains to each gate hauled by hand winches or some form of power machines. Direct acting hydraulic rams placed in covered pits just below the coping level of the lock were first introduced about 1880 at the Barry docks. This system, in improved form, became widely used in Great Britain (see fig. 25). On the continents of Europe and North America, electrical power has generally been employed for operating gate machinery. At the Panama canal, a large horizontal spur gear driven by an electric motor operates the gate. Another widely used form consists of a connecting rod in the form of a rack which is engaged by a worm gear driven by an electric motor. In both cases, operating machinery is placed in pits at the side of the lock.

Dock Caissons.—Caissons for closing the entrances of wet docks, dry docks and locks are constructed with buoyancy and ballast tanks for the purpose of floating or sinking the caisson or adjusting the unbalanced weight. The contained water ballast is varied at will by means of valves and pumps located within the

caisson. Rolling caissons having wheels fixed to the underside on which they travel over rails on the floor of the entrance. In some cases the wheels or rollers are attached to the floor and the rails to the caissons.

The second and third types require a long recess or camber formed in the side of the entrance into which the caisson may be

FIG. 26 - CROSS SECTION OF OUTER BERTHS BALLANTYNE PIER VAN COUVER B.C.

withdrawn to open the passage. In a dry dock at Dundee, Scot., floating caissons are hinged at one end and swing out into a recess. In the dock wall, a rolling caisson was used at the Garvel dry dock at Greenock, Scot., in 1874. Others are installed at the entrance of the Bruges ship canal, the Congella dry dock at Durban (1925), the Kruisschans lock at Antwerp (1927) and the Ymuden lock at Amsterdam (1930). The caissons which close the combined lock and dry dock at St. Nazaire (1932) and the locks at Bremerhaven (1931) and Dunkirk (1940) are supported on a submerged roller carriage at one end and slung at the camber end from an overhead roller carriage travelling on the side walls of the camber chamber. For closing large dry docks, sliding caissons have been adopted in later cases as indicated in Table III.

A floating caisson is occasionally arranged to draw back into a chamber and in this form differs only slightly from the sliding caisson. Sliding or rolling caissons, although more costly than simple floating caissons, have been favoured because of their ease of operation through mechanical means. They are, however, subject to maintenance and occasional repairs.

Relative Advantages of Gates and Caissons.—In general practice, the various types of mechanically operated gates including the sliding, rolling or hinged arrangements, have been found easier to operate. In wet basins and the older graving docks, they have been generally employed. As indicated in Table III, the great majority of graving docks are provided with caisson gates, which consume more time in sinking into their recesses, but the relative infrequency of operation in graving docks compared with that of wet basins reduces the importance of this factor for graving docks. Floating caissons further obviate the necessity of providing recesses in the structure and require almost no mechanical maintenance.

EQUIPMENT OF DOCKS

Docks are essentially gateways of import and export commerce and are arranged for the transfer of cargoes and passengers between ships and radiating lines of distribution. In addition to the facilities needed for embarking and discharging of cargoes at the water's edge (local accommodations, such as transit sheds, passenger terminals and land loading equipment), provision must often be made for the transfer of passengers and commodities by rail, highway and air to points throughout the territory served by the port. These provisions include highways, railroads and air terminals situated outside the immediate area of the port itself.

Within the confines of the port area, warehouses, transit sheds, special equipment for loading and discharging various classes of cargo and other auxiliary appearances are required for the efficient handling of cargoes. Among the items of auxiliary equipment are power for dock operation, trucks, cranes and hoisting gear for the handling of cargoes from ship to transit shed, warehouse, rail and highway. These facilities constitute a complete self-contained system of operation independent of other commercial establishments but arranged to co-ordinate with the latter.

FIG. 25 - HALF PLAN OF GATES OF 90 FT ENTRANCE LOCK AT CARDIFF WALES DOCKS SHOWING ROLLER PATH AND GATE OPENING MACHINE

caisson. Caissons are fitted with greenheart or oak contact faces to which rubber hinging strips are frequently added providing elasticity needed to form a watertight joint against misalignment and seats. There are three general types of dock caissons:

1. Floating caissons which are either in ship form or rectangular and are moved without guide, or roller.
2. Sliding caissons provided with greenheart or oak keel pieces which rest on sliding ways or smooth railway over which the caisson is drawn.

for effective distribution of cargoes.

In effect such marine terminals are links between land and water transportation systems. They may be bottlenecks or channels of sufficient dimensions and facilities to afford the smooth flow of commerce between two means of transportation. A terminal may be generally local where the destination of ship-borne cargo is close to the terminal location and the outbound cargo finds its origin within the locality. Or, the terminal may serve for the transfer of water-borne commerce to widely dispersed territory involving further transportation by land or inland waterway. In general, marine terminals are a combination of the two extremes. A marine terminal in a large city like New York is an example of diversification and is confronted with the restrictions of location, enormously high real estate values and consequent high taxes. Mobile Ah, on the other hand, is relatively free from these burdens. While each port is a problem of itself certain items of equipment are common to most ports and can be adopted generally.

Railways and Roads—In order to deal expeditiously with cargoes brought into and dispatched from docks, numerous railway sidings are arranged along the quays. In ports with a large railway traffic classification yards and storage sidings are usually located within or near the dock area in order to avoid congestion on the quays.

The layout of railways in a dock area presents a problem similar to that of the freight yard of a medium-size city. At Savannah, the railway and classification yard is singularly arranged to accommodate five tributary railways. The warehouses are arranged in several rows of single story buildings with paved roads on one side and depressed tracks on the other. The Boston and Maine railroad marine terminal, Mystic Pier No. 1, Boston, has double tracks on the wharf apron and depressed tracks within the transit shed which divides the building into two sections. Access for freight movement by motor trucks across the depressed tracks is afforded by a collapsible bridge at the floor level.

Growth of motor highway transport made it necessary to build permanent connections from adjacent highways by means of ramps and overpasses for direct access to the loading floor of the transit sheds.

Warehouses and Transit Sheds—The arrangement of transit sheds follows in general the pattern of a one story building with sufficient height about 20 ft., for the stacking of incoming cargo and the operation of fork lift trucks. In the most modern application, depressed tracks run the whole length of the building along its centre line and afford the handling of freight directly onto the car floor. Clear space on each side of the track is provided for the operation of motor trucks. The transit floor, therefore, must be relatively free of columns supporting the roof, which in most cases is carried on long span trusses. Where double sided piers and quays are adopted, as in the case of railway marine terminals, widths are from 300 to 500 ft., usually in order to provide ample space for the modern facilities of transit sheds. Fig. 26, illustrating the Ballantyne pier at Vancouver, B.C., and fig. 27, showing a cargo pier at Philadelphia, are typical examples. This

type of construction is common in the Atlantic ports.

Warehouses built in connection with dock facilities follow a wide range of design depending upon the type of cargo and the length of time the cargo is likely to remain at the port. They range from one story sheds to warehouses of eight or nine floors. For the storage of perishable goods, refrigerator warehouses have been constructed in many of the larger American ports.

Elaborate and costly plants for loading, discharging and storing special classes of cargo in large quantities have been established in many of the large ports of the world. Among them are bulk handling facilities for coal, grain, ores and oil. The bulk handling of wheat at such ports as Montreal, New York, Vancouver, B.C., and Port Arthur, Ont., necessitated the building of vast granaries and elevators holding more than 100,000 tons and capable of loading it into the ships at the rate of 3,000 tons per hour. For the discharge of grains, pneumatic and bucket elevators, the working of which is almost entirely automatic, are provided in many ports. Floating pneumatic elevators for discharging grain from ships into lighters or shore granaries are commonly employed. Appliances for the shipment or discharge of ores have been developed to a high standard of efficiency in some of the lake ports of the United States. Hoists can unload ore boats of the Great Lakes at the rate of 2,400 tons per hour.

Handling of Oil—Docks for oil tankers are usually located remote from other cargo operations and at points where tankers may be towed away from their berths in case of fire. The sea transport of petroleum in barrels is small compared with bulk cargoes, which in the larger tankers amount to the equivalent of 250,000 bbl. or more. Large tankers are loaded by pumping from large storage tanks or reservoirs through force mains. Such ports as Los Angeles, Calif., Corpus Christi, Tex. and Abadan, Iran, are prominent in the shipment of bulk cargo. The large bulk of the maritime trade of Los Angeles in petroleum products was an important factor in the development of the port. The berths at which tankers load and discharge are isolated from other structures and moored to the jetties or dolphins connected with the shore by light piled structures upon which pipe mains are carried. Provisions for bunkering of ships using fuel oil is commonly afforded by a special pier. Wharves are isolated from the tanker berths, usually in the lower reaches of the dock area and preferably seaward from other piers. Efforts are usually made to prevent a flow of oil beyond the limits of the oil dock area.

Coal Shipping Ports—At docks whose principal export trade is coal, the arrangement of quays and berths is planned with special reference to the running of coal cars to and from the shipping points. In the ports of northeast England high level coal hoists are much used, mainly because of the high elevation of the ground in the neighbourhood of the shipping berths, as for instance, on the river Tyne. At many high-level hoists such as those at Dunston (Gateshead) on the Tyne and at Blyth, which are built parallel to the river bank, trains of cars are brought onto the wharf and discharged successively by means of chutes into vessels lying alongside. In situations where the elevation of the surrounding ground is insufficient to provide for gravity discharge

FIG. 27—PLAN OF CARGO PIER PHILADELPHIA, PA. SHOWING ARRANGEMENTS FOR BERTHING CARGO

FIG. 28—CROSS SECTION THROUGH PUMP ROOM OF DRY DOCK AT THE KING'S DOCK SWANSEA WALES

from hoists to the hatchways of large modern vessels, hydraulic hoists are often provided, as in the docks of south Wales and Scotland as well as at English northeast coast ports. (Electric hoists are sometimes used in American and continental ports, but in Great Britain hydraulic hoists are generally employed.) Cars are brought to the shipping points at quay level or over a graded gantry structure raised sufficiently high above the quay to avoid obstruction of the quay space.

The coal hoist is contained in a steel lattice-work tower erected on the dockside. The tower may be either fixed in position or capable of limited movement along the quay to suit the position of a ship's hatchway. The loaded car is raised on a cradle or platform to the required height for the discharge of the coal through adjustable steel chutes into the ship's hold. In some ports the practice is for cars to discharge through bottom doors, in others the cars are fitted with end doors and are tipped on a cradle in the hoist. The running of cars to and from the hoist is assisted, wherever possible, by suitable grading of the tracks. Empty cars are sometimes run off from the hoist at a higher level than the loaded car roads and travel by gravity to the empty sidings. Electric and hydraulic capstans are also used for working the cars at shipping places.

Electric conveyors are much used in the shipment of coal, in some cases raising it from quay level. They are also used at some coal wharves in order to increase the height of the point of delivery of the coal.

The wharf or jetty on which the coaling hoist is erected is frequently constructed over and in front of a riprap slope to avoid the necessity of building a continuous deep water wall. Appliances to minimize the breakage of coal in falling from the chute into the ship's hold are commonly used at ports where grading of coal is important.

The United States port railway freight cars are of much larger capacity than those of Europe. The shipment of coal is effected both by hoists and conveyor belts as in the United Kingdom, but the tipping arrangements provided for the cars are on a much larger scale, and it is customary to discharge them by means of oscillating "tipplers" or "dumpers" into large hoppers whence the coal is delivered to the ship, either directly or over conveyor belts, through chutes as required. The large hoppers serve as reservoirs to equalize the rate of supply. In some cases the coal is dumped from railroad cars on the low level into very large pier cars which are raised by hoists and are tipped over hoppers at a high level. A coal shipping installation on the belt system, put into service at Baltimore in 1918 by the Baltimore and Ohio railroad, employs self-trimming loaders which shoot the coal at high velocity in any desired direction between decks. Somewhat similar mechanical trimmers are in use at the several other American coal ports.

By these means, in conjunction with highly developed arrangements for dumping cars and belt feeding the rate of shipment of coal has been augmented greatly. The Baltimore pier is double-sided, 700 ft. long, and has four main coal loading towers. More than 40,000 tons have been loaded there in one day. The use of the American type of large coal cars and mechanical trimming enables ships to be loaded with coal at some of the best equipped U.S. ports more rapidly than in British ports, where the time rate for a complete cargo often does not exceed 600 tons per hour and is usually less because of delays in trimming the coal between decks. (See also BUNKERING OF SHIPS.)

Cranes.—Docksides cranes for general cargo purposes are frequently of the portal type, travelling on rails laid upon the quay with space between the legs (which carry the crane platform) for railway cars to pass under. In some docks where warehouses are near to the face of the dock wall, travelling cranes of a semi-portal type are employed, one pair of the crane legs travels on rails laid near the quay edge and the other pair on elevated rails fixed to the wall of the building. As a result nearly the whole quay space is left free for the passage of transport. This has become increasingly important as more goods move by large trucks.

Cargo cranes must be raised high enough above the quay surface to enable their jibs to command the hatchways of ships rising high above the water level. For general purposes cranes of 1½, 3 and 5-ton lifting capacity are most commonly used, but for special purposes much more powerful travelling cranes are provided. Floating and fixed cranes of great capacity are employed for dealing with exceptional loads. Some floating cranes lifting

250 tons are in use and at least one fixed crane that at the Philadelphia yard, is capable of lifting 350 tons.

Some modern dockside warehouses have been equipped with electric cranes travelling on the flat roof of the building and arranged to work cargo to and from the several floors of the warehouse through hatchways formed in them and in the roof, as at the Gladstone docks, Liverpool.

In New York and some other ports of the United States, particularly on the Atlantic coast, quayside cranes are in ship cargo use to a limited extent only. The bulk of the working of general cargo is effected by a process called "burtoning." This consists of the joint working of the load by means of a ship's derrick and a fixed cargo mast or hoist attached to the wall of the pier shed which is built out close to the water front.

Electric current for dockside cranes is taken either from conductors in conduits laid below the quay surface or fixed to the walls of quayside buildings, or by means of flexible cables from plug boxes at points on the quay. (See also CRANES.)

DRY DOCKS

There are two kinds of dry docks. The first is a fixed dock, commonly known as a graving dock, for the graving or scraping of a ship's bottom. Graving docks are wet docks or basins which may be unwatered and made dry by means of a closing gate and pumping equipment to extract the water. One or more vessels are brought in afloat, the gate is closed and the water is pumped out, exposing the entire hull of each vessel and making it accessible for repairs.

The second type is the floating dry dock, a movable marine structure which can be sunk or raised at will by varying the amount of water ballast. A ship is brought into the partially submerged dock, whereupon both the ship and dock are raised until the entire ship is above water. Floating docks range in lifting power from 300 tons to 100,000 tons.

GRAVING DOCKS

Graving docks are employed both for the building and the repair of ships in principal ports throughout the world. The locations and controlling dimensions of typical graving docks are given in Table III. Notable examples of graving docks are found

FIG 28—ORIGINAL TREMIE METHOD DEVELOPED BY FREDERIC R. HARRIS TO BUILD GRAVING DOCKS. A TREMIE CONCRETE FORMS. B FINISHED CONCRETE DOCK.

FIG 30—TIMBER CAISSON GATE FOR GRAVING DOCK AT SAVANNAH, GA.

in such U.S. ports as Boston, New York, Brooklyn, Bayonne, Philadelphia and Norfolk and also at Pearl Harbor, T.H. These are in general concrete structures of dimensions up to 1,100 ft long, 150 ft wide and 42-ft depth below mean low water, equipped with floating caisson gates, inlet and outlet conduits, pumps, compressors, electric substations and the usual utilities employed in shipbuilding and ship repairing.

When a ship is afloat in it, a fixed dry dock or graving dock is similar in general appearance to a wet dock closed by a tidal gate. There are two basic differences. First, the gate by which the water within the dock is controlled is arranged to retain the water

in a wet dock and exclude it in a graving dock so that repairs may be made to the hull of a ship. Secondly, the graving dock is made dry by pumping water out to sea and is filled through intake channels from the sea. When ships were small and shallow, they could be put in a cradle and hauled out of the water on rollers on a sloping slipway, but when they became larger, floating dry docks or graving docks were required to serve them. The material of graving docks was at first largely brick, but the use of concrete of great strength requirements for the material at hand dictated the use of concrete. Figure 28 illustrates a large dock at Singapore.

Experience in the building of early graving dry docks showed that even these relatively small structures were completed only

FIG. 21.—FLOATING CAISSON FOR EMERGENCY USE AT ROSYTH, SCOT.

after years of effort—ten years was not an unusual period. The history of graving docks was also marked by such disasters as the collapse of the finished dock at Pearl Harbor in 1914, when the bottom of the 1,000 ft long dry dock suddenly let go.

This costly lesson demonstrated that a large graving dock must have a strong and substantial foundation and the vessel must be buoyed. Consequently at Pearl Harbor the 1,000-ft dock was rebuilt in sections after the 1914 disaster. Each concrete section block, weighing about 8,000 tons, was built on a 3,500 ton floating dry dock. As the concrete block developed in weight the dock was gradually forced down. When a block was completed it was floated out and sunk into place so that the buoyant steel tank could be floated in and attached to the block, whereupon the block, acting as a bottom to the steel tank, was towed away and sunk in place. This experience indicated that graving docks thus built would involve not only extra cost for the complicated equipment but also a longer time period that could be allowed. Excess struts and a large draft would be wide to the bottom below the water surface and excluding the water therefrom is difficult and hazardous

In the construction of later graving docks the difficulty was overcome by the adaptation of the tremie method of depositing concrete previously used in subway and tunnel work. It was employed in the construction of the Erie Basin Tunnel in roof and floor applied to a graving dock. The Erie Basin, New York, is a metal structure of depositing concrete under water through a large pipe to avoid the disturbance of the mixture which would occur in depositing it through a considerable depth of water. It was further developed in the construction of the Erie Basin Dock, New York, in which the concrete was deposited by placing steel tremie form units on a previously prepared subgrade. In construction of the Erie Basin Dock, the concrete was poured in one continuous operation by means of tremie pipes. Steel sheet piling was suspended along the back line of the side walls with the lower end of the sheet piling resting on the bottom of the dock. A steel plate was placed on the shelf behind the sheeting after the tremie concrete had set. Gravel ballast was then placed in a pile at the centre for the added weight to counterbalance the hydrostatic pressure, and the cofferdam was then dewatered for completion of the dock in the dry. As the concrete walls were built up the ballast was gradually removed. The concrete was as coarse aggregate in the wall concrete.

This dock was completed and in use in less than two years at a cost within the original estimates, in contrast with earlier docks which required ten years to build at an unpredictable cost. The method was modified in subsequent builds by building the side walls in sections by means of short, narrow cofferdams which were dewatered separately. This permitted the retention of full water head in the central part of the dock, thereby avoiding the transverse bracing and need for jacking.

Still further modifications were made for smaller and shallower docks at Pearl Harbor and Mare Island. The dock dimensions were such that a single line of sheet piling was used above the trime floor

with wale and diagonal braces embedded in the treme floor. The treme sill extended beyond the walls to form a shelf which picked up the weight of the backfill. Fig. 39 illustrates the original treme method and is taken from the U.S. patent issued to Frederic R. Harris in 1904. Reinforced concrete dry docks of this type at Boston, New York, Havana, and elsewhere have become the generally accepted practice (see Table III). These graving docks were founded on steel H piles with concrete floors up to 20 ft. thick. Reinforcement was attached to prefabricated forms placed under close tolerances as deep as 70 ft. below mean low water by divers and the submerged concrete was poured in place. Internal bracing was used to maintain the desired level. Internal flooding and discharge conduits, together with floating ship-type caisson gates, at forced utilization of the dock functions at all stages of tides. The graving docks at Brooklyn, Philadelphia and Norfolk afforded a clear docking space of 1,100 by 150 ft. and were intended to accommodate the largest battleships of the U.S. Navy. The graving dock at San Francisco ship "Missouri." Alternative methods involved the use of well points and deep well pumps. The graving docks at Callao, Peru, San Juan, P.R. and Veracruz employed well points, and deep well pumps were adapted successfully to the construction of graving docks at San Diego

Caisson Gates—Graving docks are closed at their entrances by caisson gates of four general types, of which two are most prevalent.

FIG 32 — FIRST PATENT FOR A FLOATING DRY DOCK IN THE U S ISSUED TO J ADAMSON DEC 13 1816

FIG 33—OLD BALANCED OR GRAVITY FLOATING DRY DOCK

sliding gates and floating or ship type gates. Table III shows that relatively few sliding gates were adopted (usually in docks built prior to 1937) and that the great majority were of the ship type. They are built variously of timber, cast iron and steel, according to the available supply and economy of materials. While a timber gate built in 1942 continued in active use at Savannah (fig. 30), all welded steel gates, if properly maintained with protective coating, were found to be more economical. Riveted steel caissons remained in service after more than 50 years without special protective measures. Where sliding gates have been provided at the dock entrance, the ship type caisson has been utilized for dividing the dock internally into two compartments for occasional use. Fig. 31 shows an early form of steel floating gate.

FLOATING DRY DOCKS

A floating dry dock is a buoyant structure designed to raise and support ships out of water and to lower them again to floating condition at will, so that their underwater portions may be inspected, painted or repaired.

An early primitive method of exposing a ship's bottom for cleaning or repairs was adopted about 1700 in the harbour of Kronstadt, Russia, during the reign of Peter the Great. An English ship was in need of repairs, and since no facilities were available in that harbour, the captain bought an old hulk which he gutted completely and to which he fitted a watertight stern gate. He then berthed his ship inside the hulk shell thus formed, closed the gate and pumped out the water. He was then able to make repairs to the underwater body of his vessel. This type of dock continued in use for more than 200 years and was known as the "Camel" dock, after the name of the Kronstadt hulk.

In 1785 Christopher Watson built a timber dock similarly equipped with gates for the express purpose of docking a ship in the dry while resting on the bottom of the Thames river at Rotherhithe. Its principle of operation was much the same as that of the "Camel" dock.

As early as 1809 a design for an iron floating dry dock was patented, but none had been built. A patent issued to J. Adamson in 1816 (see fig. 32) originated from the wreck of an old hulk lying on a sloping beach. Its stern was removed and gates similar to those of a canal lock were provided to close the opening. With the gates open, the structure resting upon the bottom was practically submerged. At high tide the ship to be docked was floated in. As the tide receded the water left the dock and the gates were closed preventing its return. The structure patented by Adamson was not strictly speaking a floating dry dock, since it lacked lateral or longitudinal subdivisions to confine the water inside the dock. As designed, pumping would cause the water to flow to the lowest corner and it would be impossible to keep the dock and the vessel on an even keel without exterior bracing.

It is probable that the inventor intended the dock to rest on the bottom. An extra high tide, however, must either flow over the sides or float the structure. In the latter case it became the first floating dry dock, as the title of the patent indicates. This may have occurred at first against the will rather than from the intent of the inventor. Primitive as this form of dock was and

limited as was its use, one of precisely this construction was still in use in Weehawken cove, Hoboken, for dry-docking and repairing of canal boats at the turn of the 20th century.

Fig. 33 illustrates the first hollow floating dry dock, built in Brooklyn and the oldest floating dry dock in use during the first part of the 20th century at Erie basin, Brooklyn. As originally constructed, this dock had a gate at each end and was intended to operate after the principle of the dock invented by Adamson, but when completed the gates were found impracticable and were removed. Thus it became the first U-shaped hollow dock. Built between 1845 and 1850, this dock was 330 ft long by 100 ft wide. It was known as the old balanced or box dock and it was the largest floating timber structure constructed up to that time. When it was found difficult to handle such a single large floating structure with a ship upon it, the development took an opposite turn, and a number of small floating structures were built to be connected together and used as a single dock. The resultant dock became known as the sectional floating dry dock. Each section was short enough to be docked on the other section. The floating sections, each a small box dock, were connected together on each side by locking logs, designed to permit a limited amount of motion between the sections, while keeping them in alignment, particularly while sinking. These docks were found to be very practical, and large numbers of them continued to be built where timber was plentiful (see fig. 34).

About the same time the U. S. navy built its first hollow-sided and hollow-pontooned dock of timber in the navy yard at Portsmouth, N. H., in 1848. This dock was not a complete success as, being a timber dock, it would not of itself sink low enough to allow a ship to enter. Docks had to be fitted within the side walls above the normal water line to form a chamber into which water could be pumped in addition to that which would flow into the dock by gravity.

In the meantime various other methods of raising ships were attempted, including primitive methods which were forerunners of marine railways and systems of hydraulic cylinders.

One of the early devices for raising a ship out of water for examination and hull repairs consisted of two rows of cast iron columns, each column containing a hydraulic cylinder acting as a jack. Upon each pair of columns was placed transversely an iron girder. Above the resultant series of iron girders was floated an iron pontoon, which when sunk into position formed a movable platform controlled in depth. The ship to be docked was floated directly above it. As the hydraulic jacks were set to work the girders, pontoon and ship were raised high enough for the water to flow out of the pontoons, making them buoyant. The pontoon and ship were towed clear, the girders were allowed to sink, and another pontoon was placed upon them for a repeat performance. Among various locations where the system was applied was the Victoria dock in London.

In the latter half of the 19th century docks began to be built in England from the designs of George Rennie, James Campbell and others, which were worked at Cartagena, Sp., Saigon, Indochina, Bermuda and other places. The designers' attention became more and more concentrated on the self-docking problem, which problem the sectional dock had so effectively solved for the timber docks.

The Campbell design became the most popular and was used for the 60,000 ton Southampton dock, which was built to serve the largest Atlantic liners and battleships. However, the advent of broad decked carriers during World War II made even greater demands on the floating dry dock. Floating dry docks presented particular advantages

FIG 34—TIMBER SECTIONAL DRY DOCK

of experienced labour, equipment, reinforcing steel and the ingredients of concrete.

Because of the greater structural weight of concrete docks, less floodable space is required for maximum submergence, and as a consequence the safety deck can be located at or near the pontoon deck. This results in short pump and valve shafts and permits the installation of an additional deck in each wing wall which can be used for working and storage spaces, a matter of importance in self-contained military docks where deck space is at a premium.

From other points of view the use of a heavy material is a handicap in a structure utilizing buoyancy for lifting. The ratio of useful lift to dock weight is low in concrete compared to that of steel or timber.

Because of its greater weight, it is difficult to provide sufficient longitudinal strength in a long concrete dock to resist sea movements. Self-docking is also difficult to incorporate in a concrete dock but experience has shown that underwater maintenance is low. The field of usefulness of concrete docks remains in trough docks of small or medium size which can be readily towed.

Inclination Dock—The strongest and at the same time the lightest form of self-docking dock is the inclination dock. It is so put together that any part of its underwater structure may be exposed by tilting so that more than half the bottom is exposed. This dock is a one piece trough dock of considerable longitudinal stiffness. Its large twin buoyancy chambers render it practically unsinkable by a bomb hit, and, in addition, the absence of heavy self docking gear makes it the lightest of all dock designs (see fig 40).

Mobility of Floating Dry Docks—The mobility of this type of dock is attested by several examples. One was that of a British one-piece riveted steel floating dry dock, 682 ft long, 144 ft over walls at

origin to shipside or from ship to destination. Many items are set on pallets and hauled to and from highway or rail carrier by self-propelled hydraulic lift units that will hoist 1 ton or more, move it as needed and raise it 15 feet or higher. Pallets and transfer facilities are built to accommodate operation of trucks, trailer truck units, which

FIG 39—ADVANCE BASE SECTIONAL DOCK

require space for turning rather than straight on and off travel on rails. This has the advantage of more direct movement to shipside and of moving units in and out with much greater facility than by rail.

Greatly increased bulk transit resulted in construction of much larger capacity vessels than have been in use. General cargo ship size has been limited by the tonnage destined for one area that can be economically assembled. Depth of vessels has been governed by available world channels for all but a few ships planned for operation on specific routes. However, for bulk materials where large quantities move between specific ports, the economy of large tonnages is apparent. Ship crews, time in port and other factors are about the same for large ships as small ones. Speeds can be greater and cost per unit moved greatly reduced.

By mid 19th century, tankers as much as 780 feet long and others with a beam width over 100 feet had been launched, carrying more than 400,000 bbl of petroleum from major oilfields to use areas of North America and Europe. Bulk ore carriers had moved into the 55,000-ton class.

This trend to much larger cargo ships indicated that all new facilities had to be made correspondingly larger. Wet basin entrances in tidal harbours, dry docks and channels had to be larger and of deeper draught. Many docks would require deepening alongside as well as revised and enlarged space and handling facilities (See also DOCKWAYS AND NAVAL BASES, HARBOURS).

DOCK WARRANT,

English law, a document by which the owner of a marine or river dock certifies that the holder is entitled to goods imported and warehoused in the docks. In the Factors act, 1889, it was included in the phrase "document of title" and defined as any document or writing, being evidence of the title of any person therein named to the property in any goods or merchandise lying in any warehouse or wharf and signed or certified by

FIG 38—RENNIE DOCK

pontoon deck level with a clear berth of 105 ft 6 in. for docking and a maximum depth of water at the pontoon deck 40 ft. The normal lift power was 30,000 tons. The dock was built by Camel-Laird & Co at Bergenhead, Eng., in 1912 for the dockyards at Portsmouth. After doing service at Portsmouth it was towed through the Irish sea around the north of Scotland to Scapa Flow during World War I. Later it was towed to Alexandria, Egypt, for service in World War II, remaining there until prepared for towing in 1946, when it was again towed to Port Royal, arriving there July 6, 1946. It was further towed from Port Royal to the dockyard at Bermuda, arriving there Aug. 28, 1948. These various migrations attested the seaworthiness of the dock after 36 years of active service. When it was inspected in 1950 the framework was found to be structurally sound and well protected, the side walls showing the ravages of wind and weather only where replacements had not been made. On July 11, 1951, this floating dry dock began another 3,000-mi. voyage from the dockyard at Bermuda to Falmouth, Eng.

A floating dry dock of self docking type, although wider than the

FIG 40—HARRIS INCLINATION DOCK. A. SUBMERGED PRIOR TO SELF DOCKING AT THE MOMENT THAT THE TWO LOCKING PINS FOR THE DUPLEX SWIVEL JAWS ARE SHIFTED FROM THE PIER SPUDS TO THE DOCK SPUDS. B. HEeled OVER SO THAT MORE THAN HALF ITS BOTTOM IS EXPOSED.

pleted, the structure was righted again from the 90° position by a reversal of the operation and proceeded on its journey from its shipyard base on the Atlantic seaboard to its Pacific station.

Modern Trends—Trend in waterfront construction in the 1950s was to larger facilities to accommodate (1) changed methods of transferring cargo from shore to ship and (2) much larger bulk cargo carriers. Highway truck and trailer units move much cargo direct from

the person having the custody of the goods. It passes by indorsement and delivery and transfers the absolute right to the goods described in it. A dock warrant is liable to a stamp duty which may be denoted by an adhesive stamp, to be cancelled by the person by whom the instrument is executed or issued.

DOCKYARDS AND NAVAL BASES. Every navy, both in peace and in war, requires dockyards and bases where repairs can be executed and ammunition, fuel and stores supplied and where the needs of the personnel can be provided for. This is true also for the mercantile fleets which are served impartially by the great commercial ports and repair yards of the world but the term "dockyard" is usually now applied only to the national establishments for the building and upkeep of warships. In its full est sense, a dockyard is an establishment which builds and equips warships and has complete facilities for docking and repairing them. It supplies and perhaps manufactures armaments and ammunition provides general and victualling stores and fuel and also contains training, medical and other establishments for the service of the personnel. It is, however, only the few large home dockyards in each country which are so completely equipped, and even in these only a small proportion of warships are actually built. Government dockyards are used mainly for fitting out and commissioning new ships and for the upkeep of the fleet. In most countries, private firms manufacture guns and armour, engines and boilers and often carry the building of ships to the final stages before delivering them to the government establishments for completion. Other dockyards (e.g., Malta) have no special facilities for building ships but are very completely equipped for the maintenance of a large fleet. Others again though maintaining the status of dockyards, are capable only of minor repairs and of supplying stores, ammunition and fuel, these smaller establishments are really fortified naval bases or fuelling stations (q.v.).

Every government dockyard is a naval base, but the converse is not true. A modern fleet must have a base from which to operate, and the first requirements of a base are a safe harbour for the auxiliary craft attendant upon the fleet and a protected fleet anchorage where the ships can, without molestation, replenish with fuel, stores and ammunition and give rest and recreation to the crews. Every dockyard or naval base must be defended by sufficient fixed and mobile land defenses to protect it from attack by submarines or torpedo craft, from predatory raids by a few cruisers and from attack from the air. The security of any dockyard or base, however, must depend, ultimately, upon the ability of the fleet which it serves to maintain the command of the sea.

EUROPE AND ASIA

Great Britain and Commonwealth.—Until the beginning of the 16th century England had no regular establishment for the navy and possessed neither arsenals nor dockyards. The fleet was composed of a few "king's ships" supplemented by ships provided by the seaport towns. These towns were charged with the maintenance of the fighting ships when they were laid up, and there are evidences of dockyards, or of something answering thereto at the Cinque Ports as early as the 13th century. In 1238 the keepers of the king's galleys were ordered to build a house at Winchelsea for the safe custody of the vessels. In 1243 the sheriff of Sussex was ordered to enlarge a house at Rye in which the king's galleys were kept, and ten years later the bulwarks of Rye and Winchelsea were ordered to repair these buildings. As the fighting ships developed from the galley to the larger sailing ships there appear to have been depots for both ships and stores maintained at Southampton and Portsmouth, and Henry VII, who laid the foundations of British sea power, built the first dry dock at the latter place in 1495. Henry VIII in 1509 purchased land at Woolwich and Deptford upon which the building of the first royal dockyards was started, and in 1540 the royal dockyard at Portsmouth was founded around the site of the dry dock of Henry VII. Queen Elizabeth I started the dockyards at Chatham and Sheerness, and both were considerably extended by Charles II after the Restoration. Plymouth although its ships played so great a part in Elizabethan times did not become a royal dockyard

until 1689 when William III commenced the Plymouth dock at Devonport. The small dockyard at Pembroke was founded in 1814 and was followed by the establishment at Haulbowline (Queenstown).

Until 1832 the royal dockyards remained under the control of the navy board, which had been founded in 1546 by King Henry VIII. The admiralty was responsible only for the fleet at sea, and this dual control of the navy had many disadvantages. It led to extravagance and allowed mismanagement and corruption which several times in the history of the country, came near to bringing about national disaster. With the Reform bill in 1832, the admiralty and the navy office were amalgamated and the present system of dockyard administration came into being. During the 19th century a gradual change came over the dockyards with the transition from sail to steam, and many additions were made to meet the needs of the modern fleet. The most important improvements at any one period were brought about by the Naval Works Act of 1895, which sanctioned a large number of new works. The defensive harbours were commenced at Portland, Dover and Gibraltar and also dockyard extensions at the latter place. At Devonport dockyard the great Keyham extension was started, and new works were put in hand at Hong Kong and Simonstown, South Africa. At the same time the building of naval barracks at the three home ports began, together with new hospitals at Chatham, Haslar and Haulbowline and colleges at Dartmouth and Keyham.

The growing German menace in the North sea in the opening years of the 20th century compelled the admiralty to seek a new base on the east coast, farther north and easier of approach than Chatham. In 1903 the government approved the creation of a new naval dockyard at Rosyth on the Firth of Forth. Though the outbreak of World War I found this base far from complete, it eventually became invaluable as a first class dockyard with three big graving docks. Between the wars it was reduced to a care and maintenance basis but rapidly expanded again in 1939. When hostilities ceased, it was decided to keep it in active operation.

In addition to Rosyth, the main British naval bases in World War I were the large dockyards at Portsmouth, Plymouth, Chatham and Malta with smaller establishments at Sheerness, Portland, Haulbowline and Pembroke. The dockyards at Gibraltar, Hong Kong, Bermuda, Simonstown and Sydney, Austr. all proved their worth, as did such minor bases as Colombo, Cey., Wei-hai-wei, China, and Bombay and Calcutta, India. The ports of Harwich, Dover and Immingham acted as bases for light forces, and Scapa Flow, as the main operational base for the grand fleet, was equipped for storing and minor repairs, with Cismarty as a second base.

With the outbreak of World War II all these bases, with the exception of Wei-hai-wei and Haulbowline, which had been surrendered to China and Ere, respectively, were available and, in addition, the great new dockyard at Singapore which had been constructed to meet the Japanese threat—though it was soon to be overrun. But these facilities were not enough, and during the course of the war new repair bases manned by the admiralty were set up at home and abroad at Lyssens in Scapa Flow, Corpcach and Dunstaffnage on the west coast of Scotland, Alexandria, Egypt, where a large floating dock was moored, Massawa, the old Italian naval base on the Red sea which was equipped by the U.S. in 1942 but manned from England, Kilindini in East Africa, Durban, U.S. of S. Africa, which possessed the only battleship dock in the Indian ocean, Freetown, Sierra Leone, where a floating dock was put into operation in 1943, Trincomalee, Cey., and Brisbane, Austr. Ten minor bases were established by Canada on the Atlantic and Pacific coasts to supplement the three main bases at Halifax and Sydney, N.S., and Esquimaux, B.C. Facilities were also developed in places where they already existed such as Bombay, Calcutta and Vizagapatam, India, Cape Town, U.S. of Africa, Diego Suarez, Madagascar, etc.

A new development, known as a floating base or fleet train, was used for the war in the Pacific and enabled the fleet to remain at sea for months at a time. It consisted of floating workshops, storeships and carriers of every kind, vessels which could act as

floating docks for minor craft, oilers and amenity ships which included a floating brewery

At the end of hostilities the majority of these temporary bases were closed down, but, with the growth of dominion navies and the necessity for commonwealth bases and repair facilities to be as widely dispersed as possible, certain developments overseas continued. In South Africa, where the British admiralty retained the use of Simonstown, the Union government established a small dockyard and base for its own navy at East London and took over Salisbury Island in Durban by Durban itself and Cape Town, with an even larger graving dock, reverted to commercial use but could readily be adapted as naval bases of first importance.

Though Canada officially closed down its temporary wartime bases in Sept. 1945, the dock at Saint John, N.B., remained available for vessels up to and including aircraft carriers, while the three main Canadian bases continued to be actively employed. The dockyard and naval base at Auckland, N.Z., was developed to refit ships as large as the latest cruisers, and the dockyard at Sydney formed the main base for the Australian squadron. Brisbane remained a minor base without a dockyard, but, on Jan. 1, 1950, Manus in the Admiralty Islands was commissioned in the name of H.M.A.S. "Seadler" as an advanced royal Australian navy base. When the Japanese were expelled in 1944, this island was converted into a naval base for the U.S. 7th fleet, and two huge floating docks, warehouses, machine shops and living quarters were set up. The U.S. disposed of this base in 1947, selling many of the installations to Australia for \$1,250,000. On the other hand the dockyard at Bermuda which had served the navy for many years was officially closed down as uneconomical on March 31, 1951. But Singapore, at the opposite end of the world, continued to develop after it was freed from the Japanese.

Dockyard Administration—The system under which British dockyards are administered is uniform for all, whether the yards are large or small, at home or abroad. The control of all dockyards is vested in the controller of the navy (the third sea lord). At the admiralty, working under the controller, are the director of naval construction, by whom all ships are designed, and the engineering, ordnance, torpedo, electrical and other technical departments, each responsible for the design of its own material. The director of dockyards, also working under the controller, is the admiralty official under whose instructions the work in the dockyards goes on, involving the control of an army of artisans and labourers. Instructions emanate from the admiralty, the details are left to the dockyard officials, and in practice there is considerable decentralization.

Each dockyard is under the charge of an admiral or a captain superintendent, according to its size. His deputy as a rule acts as king's harbour master and is responsible for the berthing and moving of ships in the port. The chief dockyard officers are the constructive manager, the engineer manager, the naval store officer and the electrical engineer, whose names explain their duties, the civil engineer, in charge of all buildings, docks, basins, etc., the cashier, expense accounts officer, and medical officers. Technical matters regarding guns and torpedoes are supervised by the captains of the local gunnery and torpedo schools. There being close personal communication between responsible officers, rapid decisions can be taken in matters arising between the departments as the work progresses, and operations are thus conducted with ease and efficiency.

France—The French coast is divided into three *arrondissements* having their headquarters at the naval ports of Cherbourg, Brest and Toulon, which are also building and fitting out yards. Corsica has naval facilities at Ajaccio, Porto Vecchio and Bonifacio. On the North African coast there are docking facilities at Algiers and fortified bases at Oran and Bizerte. There are naval establishments at Saigon and Haiphong in Indochina, at Diego-Suarez in Madagascar and at Dakar in French West Africa. There are also minor naval bases in the West Indies and at Tahiti and New Caledonia in the Pacific.

In each *arrondissement* the vice admiral, who is the naval prefect, is the representative of the minister of marine and has full

direction and command of the arsenal. He is commander in chief and governor designate in time of war, but his authority does not extend to ships belonging to organized squadrons. The naval prefect is assisted by the "major general," who is usually a rear admiral and directly concerned with the dockyard and material. There are also directors of stores, of naval construction, of the medical service, of naval ordnance and works as well as of the submarine defenses which include torpedoes, mines and torpedo boats. The prefect directs the operation of the whole base and is responsible for the efficiency of ships there in reserve.

Germany—In the first years of the 20th century two great modern dockyards were built at Wilhelmshaven on the North sea and at Kiel in the Baltic, with a ship canal connecting the two. Smaller establishments were maintained at Cuxhaven, Bremerhaven, Flensburg, Swinemünde, Danzig and at Kiaochow in the far east. The last two were lost to Germany following World War I and Swinemünde as a result of World War II. All German bases had reached a high degree of efficiency by 1939, when private shipyards such as those at Elbing in East Prussia at Bredow near Stettin at Bremen and at Hamburg were also used for warship construction. At the end of hostilities all these ports had suffered considerable destruction from air bombing, and the task was completed by Allied authorities. The enormous graving dock at Wilhelmshaven, for instance, reputed to be the largest in Europe was destroyed in 1948 together with workshops and wharves. Within the limits allowed of 7,000 gross register tons and speed of 12 knots, merchant ship building was being carried out at Stralsund and Wolgast, with Warnemünde as a repair yard.

Italy—In 1939 Italy was well equipped with modern dockyards, the most important of which was Spezia with several large docks and building slips. At Naples there were more docks with building slips at Castellamare across the bay, and similarly at Taranto and Venice. A small naval base existed at Maddalena in Sardinia, and in the Adriatic the former Austrian dockyards at Trieste and Pola had also been developed. Most of these ports were severely damaged during World War II, at the end of which the naval tonnage permitted to Italy was reduced to 67,500 tons. Spezia and Taranto remained the main fleet bases, Trieste and Pola were lost and both Venice and Messina decreased in importance.

On the other hand, Augusta in Sicily was developed and merchant ship building made good progress at Taranto and Naples and in the Ansaldo yards at Genoa, Spezia and Leghorn.

Japan—From the first dockyard established at Yokosuka in 1865 expansion was rapid and, by the end of World War I, facilities were available to build and dock the largest and most modern ships. Besides Yokosuka, two large modern dockyards were constructed at Sasebo and Maizuru in addition to several minor but up-to-date bases in the outlying islands. As a result of World War II all these outlying bases were surrendered and Japan's entire fleet was destroyed, although damage to shipyards had been comparatively light. Many large naval docks, nevertheless, were destroyed by U.S. authorities, though Japan was allowed facilities to develop merchant ship building at such ports as Tokyo and Yokohama.

U.S.S.R.—Important dockyards exist at Leningrad and Nikolayev, with lesser establishments at Archangel, Kronstadt, Sevastopol, Odessa and Vladivostok. Most of these dockyards received extensive damage during World War II, but were probably repaired from German reparation deliveries of machinery and equipment. The efficiency of Soviet dockyards after the war was unknown, but they were likely to have benefited both from replanning and reequipment. As a result of their occupation of eastern Germany, the Russians were also likely to have profited from German shipbuilding methods and techniques.

Spain—Schemes for improving the old dockyards at Ferrol, Cartagena and Cadiz were making slow progress at mid 20th century, but the fleet was being steadily modernized. At both Ferrol and Cartagena there were large dry docks and building slips. The dockyard at La Carraca (Cadiz) had four dry docks but no building slips and was used chiefly as a base for small vessels. Smaller naval establishments existed at Port Mahon (Balearic Islands),

Prinf and 175 Phinns (Convoy Islands) while considerable commercial building and repairs continued to be carried out in private yards at Bullock, Giron, Santander and Bilbao.

Minor Naval Powers—Naval dockyards are maintained by all the powers that possess fleets, but those in European waters which have not been mentioned above are of secondary importance and are capable of serving only the small navies that they maintain. In South America although the dockyards themselves are small the largest capital ships can be docked at Buenos Aires and Puerto Belgrano in Argentina, at Rio de Janeiro in Brazil and at Iquique in Chile.

(S T I W, G M S S)

UNITED STATES

Within three years after the creation of the navy department in 1798 the first naval shore facilities were established at six navy yards— at Portsmouth, N.H., Charlestown (Boston), Mass., Brooklyn, N.Y., Philadelphia, Pa., Washington, D.C. and Gosport (Norfolk), Va. The Washington yard, where the first marine railway was erected in 1822 was subsequently converted to a naval gun factory and discontinued shipbuilding and all except minor repairs. The Norfolk yard had been built by the British before the Revolutionary War. In 1826 a seventh yard was established at Penarth 1 La. The first dry docks, begun in 1827 at the Boston and Norfolk yards, received their first ships in 1833. With the admission of California to the union the west coast base became necessary, and Mare Island navy yard, California, was opened in 1854. A second west coast yard, at Bremerton, Wash., on Puget sound, was added in 1897. Another east coast yard was established at Charleston, S.C., in 1901. All these yards possessed ship repair facilities. Naval stations established in the 19th century included those at Sackets Harbor, N.Y., Key West, Fla., New Orleans, La., Port Royal, S.C., and New London, Conn. The treaty with Spain at the close of the Spanish American War of 1898 gave the United States overseas naval stations at Guantánamo (Cuba), San Juan and Culebra (P.R.) and in the Philippines. In 1912 a destroyer base was established at San Diego, Calif. The dockyards, evolved over a period of a century during which the navy grew from an assortment of frigates and sloops of colonial design to a complex organization of many types of large and small combatant ships and auxiliaries, were not able to keep pace with naval progress. By the time the naval expansion program of 1938 began, most yards were crowded, and facilities were obsolescent in varying degrees. There was only one dry dock on the Pacific coast capable of handling existing battleships and carriers, necessitating utilization of commercial facilities at Hunters' point in San Francisco, Calif., and the development of the Terminal Island navy yard at Long Beach, Calif.

The first major naval expansion after World War I was the result of the 1938 Hepburn board report, which recommended three major air bases on each coast, one in the Panama Canal Zone and one in Hawaii with outlying operating bases in the West Indies, Alaska, and the Pacific island possessions, some new submarine bases and many other additions or improvements made necessary by the increase in numbers of both ships and planes. Construction of docks and naval bases is under the jurisdiction of the bureau of yards and docks.

During the period of naval expansion commencing in 1938 and ending with the victory over Japan in 1945 the U.S. navy expended more than \$9,000,000,000 for bases within the continental United States and overseas. At the peak of the World War II construction program, the navy possessed almost 7,000 shore activities in nine major categories, including these approximate numbers of units: shipbuilding and repair, 200, naval air, 150, ordnance, 200, procurement and supply, 850, personnel, 1,500, medical, 150, marine corps, 400, coast guard, 1,600, miscellaneous special services, 950. By mid-century, the naval shore establishment represented an investment of about \$12,000,000,000.

The bulk of work at U.S. navy yards has always been carried on by civilians. The industrial work of the yard was at first under a civilian chief constructor and later under a technical staff officer of the navy who served as manager. Formerly, a line officer, usually a rear admiral, was assigned to each yard as commandant.

After World War II the former manager was elevated to command of the shipyard, while the former commandant became commander of the naval base in which the yard was the principal element.

While the shipyards carried on most of the repair work for the fleet the construction of new warships was shared with private shipyards at a rate increasing with the number and complexity of types in use. Naval shipyards built practically all the navy's ships in the early days. During the days of sail there was little change in design and the yards were able to handle the comparatively simple shipbuilding operations. With the advent of steam and, later, electrical and diesel power, the navy turned to private industry for the boilers, generators and other elements of a ship's engineering plant. There was a period when most heavy vessels were built in private yards, in fact, only 2 of the navy's first 30 battleships were built in navy yards. With the design of heavy battleships and carriers used in World War II beyond the scope of many private yards, more large ship construction was turned out in navy yards, but private yards built most of the destroyers, escort vessels, amphibious craft, transports and supply ships. One important reason for contracting with private shipyards for much of the shipbuilding program is to keep the navy's shipyards open for repair work, particularly in wartime.

Usually, each shipyard is responsible for the continued repair of certain designated ships which are assigned that yard as their home yard although this procedure is modified during wartime when each yard is assigned particular functions in accordance with its location and the changing situation. For instance, during World War II, Pearl Harbor usually handled only emergency repairs of battle damage which enabled ships to resume operations or return to the mainland for complete overhaul. The west coast yards at Puget sound, Mare Island, Hunters' point and Terminal Island handled very little new construction, in order to concentrate on major repairs. The big east coast yards combined much new construction with repair work, except for Portsmouth, which concentrated on its specialty of submarine building.

An example of the wartime role of a large naval shipyard is furnished by the Norfolk yard, which, from 1940 to 1945, repaired, converted or otherwise worked on 6,350 naval vessels totalling more than 27,000,000 tons, of that number, 2,238 were taken into dry dock. In the same period, the Norfolk yard built 101 new ships, ranging from large amphibious craft (LST's) to a battleship and three carriers. The value of work performed during the war years amounted to more than \$7,000,000,000, including \$372,000,000 for repairs, \$262,000,000 for new construction and \$214,000,000 worth of diesel engines, ship's equipment and other items manufactured in the yard.

Advance Bases—In 1940 the United States navy had no properly equipped advance base other than Pearl Harbor. During the next five years, the bureau of yards and docks constructed more than 400 advance bases in the Atlantic and Pacific ocean areas. The largest of these were built at Guam, Leyte, Samar, Manus, Okinawa, Saipan, Trinidad, Argentina peninsula (Newfoundland), Espiritu Santo, Timor, Bermuda, Subic bay (Philippines), Noumea (New Caledonia), Eniwetok, Ulithi, Peleliu, Ujae, Iwo Jima, and Milne bay (New Guinea). Considerably more than half of these first had to be taken from the enemy and cleared of debris before construction could begin.

The first advance bases were set up to provide aerial protection for lines of communication to the southwest Pacific. Later ones were developed as staging bases at which convoys of transport and cargo ships were serviced and the combat fleet could be resupplied with oil and ammunition, provisions and repair. As the fleet pushed farther into the western Pacific, it became necessary to establish main repair bases at which even the largest ships could be docked and repaired, thus eliminating long, time-consuming trips to the United States.

The first large advance base in the Pacific was at Espiritu Santo, New Hebrides, the next was a main repair base at Manus in the Admiralty Islands. The base at Guam was capable of supporting a third of the Pacific fleet, a similar base was established at Leyte, Samar and a third such base was being built on Okinawa when the war ended.

Facilities at these bases duplicated installations at continental navy yards, including hospital and personnel facilities, piers, roads, shops and all utilities. Since it was impracticable to attempt the construction of large dry docks under wartime conditions, the navy developed floating dry docks, which were built in the United States and towed into the Pacific in sections. Some idea of the logistics involved can be gained from the fact that at Guam alone replenishment stocks of ammunition, food and other consumable supplies on V J day would have filled a train 120 mi long, at that base alone, aviation gasoline was used at the rate of 1,000,000 gal daily.

In planning advance bases, a system of tailor-made bases was evolved, greatly simplifying procurement of material and equipment.

Civilian labour was utilized, until the beginning of World War II, on construction projects in Hawaii, Alaska, various Pacific islands, the Canal Zone and the Caribbean area and on the 99 year lease bases acquired from Great Britain in 1940. After the war began, however, it was not practicable to use civilian workers in overseas bases or combat zones. The navy then established the navy construction battalions, popularly known as Seabees. By July 1945 the Seabees numbered 247,000 officers and men, 83% of whom were serving overseas.

Floating Docks—An outstanding feature of the U.S. advance bases was the floating dock. Floating docks had been in use for many years, the prototype of navy mobile docks was patented in 1876. Several sectional docks were built of wood about 1850, but there is little information available on their use. Two steel docks were built for the navy in 1899 and 1902 at Sparrows Point, Md. The first, of 18,000 tons' lifting capacity, was towed to Algiers, La., and in 1940 to Pearl Harbor. The second, the famous Dewey dry dock of 16,000 tons' lifting capacity, was towed to the Philippines via the Suez canal in 1905-1906. The Pearl Harbor dock was damaged on Dec. 7, 1941, during the Japanese raid, but was repaired and continued in service. The Dewey dock was scuttled in 1942 to prevent its use by the Japanese.

Prior to World War II the navy designed and built two auxiliary repair docks of revolutionary design. These were one piece docks, ship shaped in form with moulded closed bows and faired sterns closed by bottom hinged flap gates operated by hydraulic rams. Each carried its own diesel electric plant, repair shops and crew quarters. They were the first dry docks sufficiently self-sustaining to accompany a fleet into distant waters. These docks had a capacity of about 3,000 tons, during the war more than 30 of them were built for advance base use.

Sectional floating docks were built in two sizes, one with ten sections and a lifting capacity of 100,000 tons, and a smaller model of seven sections with a capacity of 56,000 tons. Another type of floating dock was built of concrete, with a 2,500-ton capacity, 12 of these were built. About 30 small 1,000 ton steel docks were also constructed. In all, the navy built 150 floating docks of all types, with a total lifting capacity of 444,000 tons, which docked more than 7,500 ships from 1942 to 1945.

(See also Docks.)

DOCTOR (Lat. for "teacher"), the title conferred by the highest university degree. Originally there were only two degrees, those of bachelor and master, and the title "doctor" was given to certain masters as a merely honorary appellation. At Bologna it seems to have been conferred in the faculty of law as early as the 12th century. Pans conferred the degree in the faculty of divinity, according to Antony Wood, some time after 1150. In England it was introduced in the 13th century, and both in England and on the continent it was long confined to the faculties of law and divinity. It was not until the 14th century that the doctor's degree began to be conferred in medicine. The tendency since has been to extend it to all faculties in French and English univer-

sities, while in Germany, in the faculty of arts, it has replaced the old title of *magister*.

Doctors of the church are certain saints whose doctrinal writings have obtained, by the universal consent of the church or by papal decree, a special authority. In the case of the great schoolmen a characteristic qualification was added to the title doctor, e.g., *angelicus* (Aquinas), *melissinus* (Bernard). The doctors of the church are: for the east, SS. Athanasius, Gregory of Nazianzus, Basil the Great, John Chrysostom; for the west, SS. Hilary, Ambrose, Jerome, Augustine, Gregory the Great, Anselm, Bernard, Bonaventura and Thomas Aquinas. To these St. Alphonsus dei Liguori was added by Pope Pius IX.

DOCTORS' COMMONS When, in 1511, Richard Bode well founded the Association of Doctors of Laws and of the Advocates of the Church of Christ at Canterbury, he and his colleagues were establishing for practitioners of canon and civil law a body somewhat similar to the Inns of Court, whose members practised in common law and equity. This society became known as Doctors' Commons. It was a self governing teaching body whose members held degrees either of doctor of civil law at Oxford or doctor of laws at Cambridge and were finally admitted as advocates by the dean of the arches. Members of the governing body called fellows, were elected from the advocates by existing fellows. The members practised in the ecclesiastical courts, in the court of admiralty—which together included the courts whose place is now taken by the probate, divorce and admiralty division of the high court—and in arbitrations involving questions of international law.

In 1565 the master and fellows of Trinity hall took from the dean and chapter of St. Paul's a lease in Paternoster row on behalf of the society. This remained the society's headquarters until its incorporation as the College of Doctors of Law Exercent in the Ecclesiastical and Admiralty Courts in 1768, and thereafter until its dissolution in 1858. This event was provided for in the Court of Probate act, 1857, and the Matrimonial Causes act of the same year, these measures were the forerunners of the institution of a single supreme court of judicature, inheriting the jurisdiction of the courts of civil law as well as those of common law and equity, and with a single bar practising before it.

See Sir W. S. Holdsworth, *A History of English Law* (London, 1903-5).

DOCTRINAIRES, the name given to the leaders of the moderate and constitutional royalists in France after the second restoration of Louis XVIII in 1815. In 1816 the *Nam jaune refuge*, a French paper published at Brussels by Bonapartists and liberal exiles, began to speak of Royer Collard as the "doctinaire". The "doctrinaires" was a popular name for a religious order founded in 1592 by Cesar de Bus. The nickname for Royer Collard was well chosen, for he made it his business to preach a doctrine and an orthodoxy. The rapid extension of the name to his colleagues proves that it had more than a personal application. The Duc de Richelieu and De Serre had been royalist *émigrés*, Royer Collard himself, Lainé and Maugué de Biran had sat in the revolutionary assemblies, Pasquier, Beugnot, De Barante, Cuvier, Mounier, Guizot and Decazes had been imperial officials, but they were closely united by political principle, and all were noted for the dialectical rigidity of their arguments. Their ideal was a king who frankly accepted the results of the Revolution and who governed in a liberal spirit, with the advice of a chamber elected by a very limited constituency. Their views were set forth by Guizot in 1816 in his treatise *Du Gouvernement représentatif et de l'état actuel de la France*. The history of the Doctrinaires as a separate political party began in 1816 and ended in 1830. In 1816 they obtained the co-operation of Louis XVIII, who had been frightened by the violence of the reactionary majority in the chamber of 1815. In 1830 they were destroyed by Charles X when he took the reactionary prince de Polignac as his minister and entered on the conflict with liberalism which ended in his overthrow. During the revolution of 1830 the Doctrinaires became absorbed in the Orléanists (See *France History*). The word "doctinaire" has become naturalized in English as applied, in a slightly contemptuous sense, to a theorist, as distinguished from a practical man.

DOCUMENT, strictly, in law, that which can serve as evidence or proof, and is written or printed, or has an inscription or any significance that can be "read", thus a picture, authenticated photograph, seal or the like would furnish 'documentary evidence'. More generally the word is used for written or printed papers that provide information or evidence on a subject (*See* DIPLOMATIC AND EVIDENCE)

DODDER, the popular name of the nonchlorophyll bearing rootless, leafless, twining, parasitic plants forming the genus *Cuscuta* formerly regarded as representing a distinct family Cuscutaceae but now included in the Convolvulaceae. The genus contains nearly 100 species and is widely distributed in the temperate and warmer parts of the earth. The slender threadlike stem is white, yellow or red in colour, bears no leaves, and in the seedling stage attaches itself by suckers to the stem or leaves of

the eastern states and adjacent Canada, the glomerate dodder (*C. parodora*), which forms dense ropes of flowers on tall herbs in the central states, and the marsh dodder (*C. salina*), abundant in salt marshes of the Pacific coast, forming golden patches on various saline herbs

DODDS, ALFRED AMEDEE (1842-1922), French general, was born at St Louis, Senegal, Feb 6, 1842, of Anglo-French origin. He was educated at Carcassonne and at St Cyr, and in 1864 joined the marine infantry as a sub lieutenant. He served as a company commander in the Franco German War, was taken prisoner at Sedan but escaped, and took part in the campaigns of the Loire and of the east. In 1872 he was sent to west Africa, and except when on active service in Cochinchina (1878) and Tongking (1883), he remained on duty in Senegal for the next 20 years, taking a prominent part in the operations which brought the countries of the upper Senegal and Upper Niger under French rule. He led the expeditions against the Boal and Kayor (1889), the Sereres (1890) and the Futa (1891), and from 1888 to 1891 was colonel commanding the troops in Senegal. At the close of 1891 he returned to France to command the 8th marine infantry at Toulon. In April 1892 Dodds was selected to command the expeditionary force in Dahomey, he occupied Abomey, the hostile capital, in November, and in a second campaign (1894) he completed the subjugation of the country. He was then appointed inspector general of the marine infantry, and after a tour of the French colonies was given the command of the XX (Colonial) army corps, becoming inspector general of colonial troops. From 1904 to 1914 he was a member of the Conseil Supérieur de Guerre. He died in Paris on July 18, 1922.

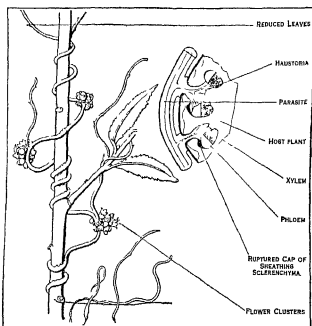

DODECAHEDRON *see* SOLIDS, GEOMETRIC

DODECANESE, Greek inhabited islands in the Aegean sea, known also as Southern Sporades and Aegean Islands. Although "Dodecanese" signifies in Greek "twelve islands," 13 are regularly included in the group, viz, Astypalea (Astropalia), Calymnos, Karpathos, Cassos, Castellorizo, Chalki, Cos, Leiros, Nisyros, Patmos, Rhodes, Symi, Telos (Rhodope). Some authors add the islet of Lipsos. Prior to 1912 Rhodes and Cos were not considered part of the group. Nikaia (Icaria) was included, however, until 1912, when it became part of the Greek state.

In antiquity these islands, especially Rhodes (*g v*), were known as centres of Greek culture. Among distinguished Dodecanesians there were Cleobulus, one of the Seven Sages of Greece, Apelles, the famous painter, Hippocrates, father of medicine, Erinna, the first Greek poetess, Antus, the comic poet, Xenophon, the noted physician of Cos, who was the first Dodecanesian to visit England. The Rhodian school of sculpture occupies a prominent place in Greek art. Especially well known works of this school are the statue of Laocoon, now in the Vatican, and the Colossus of Rhodes, which was counted among the seven wonders of the ancient world. Rhodian maritime law played a significant part in later codifications.

The Dodecanese, together with their mother country Greece, have come successively under the domination of various alien rulers (Roman, Saracen, Venetian, Genoese, Algerian, Arab and the Knights of St John of Jerusalem). In 1522 the islands were occupied by the Turks, but were guaranteed the privileges of complete autonomy in local administration in return for payment of a fixed annual tax. These privileges, despite occasional infringements, continued until 1912. In that year Italy, at war with Turkey, occupied the Dodecanese. The islanders aided the Italians, believing in the promises of General Ameglio and Admiral Presbitero, who formally assured them that autonomy would follow the abolition of Turkish rule. Indeed, an insular assembly met at Patmos, declaring the Dodecanese the "Autonomous State of the Aegean" and proclaiming the wish of the islanders to be united with Greece. Now Italy's real intentions became manifest. No recognition was given to this declaration and severe penalties were imposed upon some of the delegates. Although in the Treaty of Lausanne (Oct 5, 1912) Italy undertook to withdraw her army from the islands, the occupying forces remained, upon one pretext and another.

The great powers, especially England, recognized the strategic

DODDER (*CUSCUTA EUROPAEA*). A PARASITIC PLANT ON A WILLOW TWIG. In the small figure is seen a transverse section of the host plant, showing the contact of the dodder with the tissues of the host, which it finally destroys.

some other plant round which it twines and from which it derives its nourishment. It bears clusters of small flowers with a four- or five-toothed calyx, a cup-shaped corolla with four or five stamens inserted on its tube, and sometimes a ring of scales below the stamens, the two-celled ovary becomes when ripe a capsule, splitting by a ring just above the base. The seeds are angular and contain a threadlike spirally coiled embryo which bears no cotyledons. On coming in contact with the living stem of a susceptible plant round which it twines, the seedling dodder throws out suckers which penetrate the host, its tissues establishing organic union. By this means water is drawn from the wood or xylem and nutriment from the phloem of the host. The dodder then soon ceases to have any connection with the ground. As it grows, it throws out fresh suckers, establishing itself very firmly on the host plant. After making a few turns round one shoot the dodder finds its way to another, and thus it continues twining and branching till it resembles "fine, closely-tangled, wet catgut." The injury done to flax clover, hop and bean crops by species of dodder is often very great. *C. europaea*, the greater dodder (*See* fig 1) is parasitic on hops, vetches, sugar beet, potato and several wild hosts in Europe, but is rare in America, also willow, *C. epithymum*, on flax, hemp and some other hosts, *C. epithymum*, on various species of clover, alfalfa and other legumes. *C. traloli*, the clover dodder, is probably a subspecies of the last mentioned. In the United States and Canada about 20 species occur, a few of which have been naturalized from the old world. Among the native species are the love-vine (*C. growia*), common on herbs and low shrubs in

importance of the Dodecanese in the eastern Mediterranean. In 1913 Sir Edward Grey declared that "as long as one of the Great Powers remains in occupation of these islands the situation will remain abnormal," and that their fate interested all the great powers.

Nevertheless when the Allies wished to induce Italy to join them in World War I, they concluded with that country the Secret Treaty of London (1915), among other things promising her "full possession" of the Dodecanese. In 1917 the United States joined the Allies with the understanding that secret treaties should not be recognized. On July 29, 1919, an agreement was reached between Eleutherios Venizelos and the Italian Foreign Minister Tommaso Tittoni, whereby Italy promised to cede the Dodecanese to Greece with the exception of Rhodes, which was to have "broad local autonomy." By an additional secret accord Italy bound herself to permit the inhabitants of Rhodes to decide their own fate in the event that Great Britain should announce her willingness to cede Cyprus to Greece, although not until five years should have elapsed. On July 22, 1920, Count Sforza, Tittoni's successor, denounced this agreement. On Aug. 10, 1920, at Sévres, under pressure from the Allies, Italy concluded a new accord with Greece, similar to the previous agreement, but specifying 15 years, instead of 5, until a plebiscite might be held in Rhodes.

The Dodecanese, however, were still *de jure* a Turkish possession. In order to permit Italy to transfer the islands to Greece according to the above agreement, an article (#122) was included in the Treaty of Sévres, by which Turkey "renounced in favour of Italy all rights and titles" upon the Dodecanese. This treaty and the new Graeco Italian accord were signed simultaneously. In 1922, Italy denounced the latter. Great Britain immediately protested this unilateral denunciation.

In 1923 the Treaty of Lausanne superseded the Treaty of Sévres. Article 15 of the former is identical with article 122 of the Sévres Treaty just described. It is this article which Italy construes as giving her full sovereignty over the Dodecanese. The opposing view is based upon article 16 of the Treaty of Lausanne, which provides that "the fate of the islands is settled or to be settled by the parties interested," and upon a written reservation made by Greece at Lausanne (Jan. 21, 1923), concerning the "determination of the future lot" of the Dodecanese.

Italian authorities have applied the term "possession" to the Dodecanese inasmuch as their literacy and general cultural level have made it impossible to regard them as a colony, and since the inhabitants are obviously not Italian and thus could not be classified as a province. Their administration has been assigned to the ministry of foreign affairs.

During the occupation by Italy the Dodecanese suffered grievously from the Italian policy of "assimilation." The majority of the local Greek schools were closed, and those remaining open were compelled to conduct most of their instruction in the Italian language. Freedom of speech and of the press were abolished, and Greek newspapers banned. Heavy taxation, espionage and imprisonment without cause were the order of the day. Pressure was brought to bear upon the Greek orthodox and native churches were closed. The Roman Catholic archbishopric which existed in Rhodes prior to the Turkish occupation was re-established, and Roman missions and Uniat churches opened. These measures occasioned large scale emigration to Greece, Egypt, the United States, Austria and other countries. The population of the islands, which in 1912 was 143,080 (131,761 Greeks, 6,874 Turks and 2,445 Jews) had diminished to 121,480 by 1951.

The soil of the Dodecanese is relatively infertile except in Rhodes and Cos. All the islands are mountainous. Fruits are grown in small quantity, also tobacco, olives and wheat. Fishing, sailing and sponge diving constitute the principal occupations of the inhabitants. From the financial point of view the islands were not an asset to Italy, which was obliged to contribute 8,000,000 lire annually in addition to extraordinary credits in order to compensate for the economic deficit.

During World War II the Italians and the Germans made extensive use of naval and air bases in the Dodecanese.

With the unconditional surrender of Italy (Sept. 8, 1943), representatives of the Dodecanesian people convened in New York City (Oct. 23, 1943) and formally declared their union with the people of Greece. During the autumn of 1943 some of the islands were actually liberated, but the Germans were able to reoccupy them. Early in 1945 some of the Dodecanese were again freed, and by unanimous proclamation the inhabitants reaffirmed their decision to be united with Greece, and requested the Greek government to send representatives to administer the islands.

DODGE CITY, a city of southwestern Kansas, U.S.A., on the Arkansas river, at an altitude of 2,478 ft., the county seat of Ford county. It is on federal highways 50S and 154, and is served by the Rock Island and the Santa Fe railways. The population in 1950 was 11,262, in 1940 it was 8,487. It has railroad shops, farm implement plants, a dressed poultry plant and creameries and is the supply centre for a large agricultural and stock-raising area. The meridian separating central from mountain time passes through the city. Dodge City was settled about 1872 and incorporated in 1875. It was a famous frontier town on the old Santa Fe trail, the rendezvous of picturesque characters, the centre of important freighting lines and headquarters of the cattle business. At the peak, in 1884, herds aggregating 8,000,000 head of cattle passed through from Texas, in charge of 3,000 men. There were immense herds of buffalo in this region. Hunting parties often killed 250 in a day, and the first trains often had to wait hours while a herd crossed the track. The first winter after the Santa Fe came through, 200,000 buffalo hides were shipped from Dodge City. At some stations in the vicinity shipments of buffalo bones in 1875 averaged a carload a day. On the river 5 mi. E. of the city is old Ft. Dodge, an important frontier garrison, now the state home for disabled volunteer soldiers.

DODGSON, CHARLES LUTWIDGE ("LEWIS CARROLL") (1832-1898), English mathematician and author, son of the Rev. Charles Dodgson, vicar of Daresbury, Cheshire, was born in that village. The literary life of "Lewis Carroll" became familiar to a wide circle of readers, but the private life of Charles Lutwidge Dodgson was retired and practically uneventful. After four years at Rugby, Dodgson matriculated at Christ Church, Oxford, in May 1850. He took a first class in the final mathematical school in 1854, and the following year was appointed mathematical lecturer at Christ Church, a post he continued to fill till 1881. His earliest publications, beginning with *A Sylabus of Plane Algebraical Geometry* (1860), and *The Formulae of Plane Trigonometry* (1861), were exclusively mathematical, but late in the year 1865 he published, under the pseudonym of "Lewis Carroll," *Alice's Adventures in Wonderland*, which has become an English classic. It was an open secret that the original of "Alice" was a daughter of Dean Liddell. Alice was followed (in the "Lewis Carroll" series) by *Plantasmagoria* (1869), *Through the Looking-Glass* (1872), *The Hunting of the Snark* (1876), *Rhyme and Reason* (1883), *A Tangled Tale* (1885), and *Sylvie and Bruno* (in two parts, 1889 and 1893). He wrote skits on Oxford subjects from time to time. *The Dynamics of a Particle* was written on the occasion of the contest between William Gladstone and Gathorne Hardy (afterward earl of Cranbrook), and *The New Balfry* in ridicule of the election put up at Christ

Church for the bells that were removed from the cathedral tower while 'Lewis Carroll' was delighting children of all ages, C. L. Dodgson periodically published mathematical works—*An Elementary Treatise on Determinants* (1867), *Euclid, Book I, Proved Algebraically* (1874), *Euclid and his Modern Rivals* (1879), the work on which his reputation as a mathematician largely rests, and *Curvæ Mathematicæ* (1888). Though the fact of his authorship of the 'Alice' books was so prominent that Mr Dodgson often claimed for such a pronouncement that Mr Dodgson neither claimed nor acknowledged any connection with the books not published under his name. His memory is appropriately kept green by a cot in the Children's Hospital, Great Ormond Street, London, which was endowed perpetually by a public subscription. The first of *Alice in Wonderland* was sold by Dean C. L. Dodgson's daughter in April 1908 for £15.400.

See S. D. Collingwood, *Life and Letters of Lewis Carroll* (1898), F. B. Lenthall, *Victorian Through the Looking Glass: The Life of Lewis Carroll* (1945).

DODO, the name for large birds formerly inhabiting the islands of Mauritius and Réunion, but now extinct, and which, with the solitaire (*q.v.*), constituted the family Raphidae in the order Columbiformes. The Dutch explorers called them *vaalvogels*, or vaneous birds since no cooking made them palatable. H. L. Strickland and A. G. Melville, *The Dodo and Its Kindred* (London, 1848) and G. R. von Fronefeld, *Neu aufgetundene Abbildung des Dodo* (Wien, 1868) list known records. They survived until 1681. Specimen parts were found by G. Clark in a mud pool in 1865, on Mauritius, and others by Th. Sauer in 1889 in the same swamp. Skeletons were prepared and restorations made for Mauritius and European museums.

The huge blackish bill of the dodo terminated in a large, horny hook, the cheeks were partly bare, the stout, short legs yellow. The plumage was dark ash coloured, with whitish breast and tail, yellowish white wings (incapable of flight). The short tail formed a curly tuft. The bird of Mauritius was *Raphus cucullatus*, while on the nearby island of Réunion was a related species, *R. solitarius*.

The dodo inhabited forests and laid one large white egg on a mass of grass. Man and the hogs and other animals he imported effected its extermination.

DODONA, in Epirus, the seat of the most ancient and venerable of all Hellenic sanctuaries. Its ruins are at Dramos, near Tscharovista. Though the Greeks of the south looked on the inhabitants of Epirus as barbarians nevertheless for Dodona they maintained a certain reverence. Its temple was dedicated to Zeus, and connected with it was an oracle which would seem to date from early times, for the method of gathering responses was by listening to the rustling of an old oak tree, perhaps a remnant of very ancient tree worship. Sometimes, however, raptures were taken from doves in the branches, the murmur of a fountain, or the clanging of brazen caldrons hung round the tree or temple. Croesus proposed to this oracle his well known question, Lycander sought from it sanction for his ambitions, Athens frequently appealed to its authority. But the most frequent votaries were the Aetnians and Acetolians with the Boeotians, who claimed a special connection with the district.

Dodona is spoken of in the *Iliad* as the abode of Selvi who sleep on the ground and wash not their feet, and the *Odyssey* has an imaginary visit of Odysseus to the oracle. A Hesiodic fragment describes Dodona as Helopia as a district full of cornfields, of herds and flocks and of shepherds, where is built on an extremity (τῆς ἑξωτερικῆς) Dodona, where Zeus dwells in the stem of an oak (πῶν). The priestesses were called doves (πελῆαι) and Herodotus tells a story which he learned at Tegyria in Thebes that the oracle of Dodona was founded by an Egyptian priestess

who was carried away by the Phoenicians but says that the local legend substitutes a black dove, in which he tries to find a rational meaning. In historical times there was worshipped together with Zeus, a consort named Dione (see further ZEUS ORACLE, DIONE).

The ruins, a theatre, town walls and other buildings were identified by Wordsworth in 1852, and excavated by Constantin Carapanos after 1875. The topographical and architectural results are disappointing either the site always retained its simplicity, or else its buildings have been very completely destroyed.

South of the hill on which are the town walls east of the theatre, and towards the eastern end of a plateau about 200 yd long and 50 yd wide are the remains of the temple of Zeus, proaon, cella and opisthodomus about 130 ft by 80 ft over all. Some lower drums of internal columns of the cella still rest on their foundations. No trace of external colonnade was found. It had been converted into a church. In and around it were found statues and decorative bronzes, many bearing dedications to Zeus Narus and Dione, many small tablets of lead which contained questions put to the oracle.

Below the terrace was a precinct, flanked with porticoes over 100 yd in length and breadth, of irregular shape. One of the buildings on the south western side contained a pedestal or altar, and is described by Carapanos as a temple of Aphrodite. In front of the porticoes are rows of pedestals, which once bore statues and other dedications. At the southern corner is a gate, flanked with two towers, between which are placed two coarse limestone drums. If these belong to the original gateway, it must have been of a very rough character.

The smaller antiquities are now in the National Museum in Athens. Among the dedications are weapons dedicated by King Pyrrhus from the spoils of the Romans.

The temple of Dodona was destroyed by the Aetolians in 219 B.C., but the oracle survived to the times of Pausanias and the emperor Julian.

See C. Wordsworth, *Greece* (1839), p. 247, Constantin Carapanos, *Dodone et ses ruines* (Paris, 1878). For the oracle inscriptions, see E. S. Roberts in *Journal of Hellenic Studies*, vol. 1, p. 228.

DODS, MARCUS (1834–1909), Scottish divine and biblical scholar, was born at Belford, Northumberland, on April 11, 1834. He studied at Edinburgh and was licensed in 1858. In 1864 he became minister of Renfield Free Church, Glasgow, where he worked for 25 years and in 1889 was appointed professor of New Testament exegesis in New College, Edinburgh, of which he became principal on the death of Dr. Rainy in 1907. He died in Edinburgh on April 26, 1909. His views on inspiration brought on him a charge of unorthodoxy which was preferred against him by the General Assembly in 1890, a year after his election to the professorship, the charge was soon dropped by a large majority, and in 1891 he received the honorary degree of D.D. from Edinburgh university. He edited Lange's *Life of Christ* in English (Edinburgh, 1864, 6 vols.), Augustine's works (1872–76), and, with Dr. Alexander Whyte, Clark's 'Handbooks for Bible Classes' series. In the Expositor's Bible series he edited Genesis and I Corinthians, and he was also a contributor to the ninth edition of the *Encyclopaedia Britannica* and Hastings' *Dictionary of the Bible*.

Among other important works are *The Epistle to the Seven Churches* (1865), *Israel's Iron Age* (1874), *Mohammed, Buddha and Christ* (1877), *Handbook on Haggai, Zechariah and Malachi* (1879), *The Gospel according to St. John* (1897), in the Expositor's Greek Testament, *The Bible, its Origin and Nature* (1904). See his *Early Letters* (1910) and *Later Letters* (1912).

DODSLEY, ROBERT (1703–1764), English bookseller and miscellaneous writer, was born near Mansfield, Nottinghamshire, where his father was master of the free school. He is said to have been apprenticed to a stocking weaver in Mansfield, from whom he ran away, taking service as a footman. In 1729 Doddsley published his first work, *Servitude, a Poem written by a Footman*, with a preface and postscript ascribed to Daniel Defoe, and a collection of short poems, *A Muse in Livery, or the Footman's Miscellany*, was published by subscription in 1732. Doddsley's patrons comprising many persons of high rank. This was followed by a satirical farce called *The Toyshop* (Covent Garden, 1735).

With the help of his friends—Pope lent him £100—Doddsley set up as a publisher at the 'Tully's Head' in Pall Mall in 1735. One of his first publications was Dr Johnson's *London*, for which he gave 10 guineas in 1738. He published many of Johnson's works, and he suggested and helped to finance the *English Dictionary*. Pope also made over to Doddsley his interest in his letters. In 1738 the publication of Paul Whitehead's *Manners*, voted scandalous by the lords, led to a short imprisonment. Doddsley also founded several literary periodicals: *The Museum* (1746-67, 3 vols.), *The Preceptor containing a general course of education* (1748, 2 vols.), with an introduction by Dr Johnson, *The World* (1753-56, 4 vols.), and *The Annual Register*, founded in 1758 with Edmund Burke as editor. Doddsley is, however, best known as the editor of two collections: *Select Collection of Old Plays* (12 vols., 1744, 2nd edition with notes by Isaac Reed, 12 vols., 1780, 4th edition, by W. C. Hazlitt, 1874-76, 15 vols.), and *A Collection of Poems by Several Hands* (1748, 3 vols.), which passed through many editions. In 1737 his *King and the Miller of Mansfield*, a "dramatic tale" of King Henry II, was produced at Drury Lane, the sequel, *Sir John Cockle at Court*, a farce, appeared in 1738. In 1745 he published a collection of his dramatic works, and some poems which had been issued separately, in one volume under the modest title of *Trifles*, and this was followed by other poems and plays. His tragedy of *Cleone* (1758) had a long run at Covent Garden, 2,000 copies being sold on the day of publication and it passed through four editions within the year. In 1759 Doddsley retired, leaving the conduct of the business to his brother James (1724-97), with whom he had been many years in partnership. He died at Durham while on a visit to his friend, the Rev. Joseph Spence.

Doddsley's poems are reprinted with a memoir in A. Chalmers's *Works of English Poets*, vol. xv (1810). See also Charles Knight, *Shadows of the Old Bookshelves* (1865) pp. 189-216, E. Solly, in *The Bibliographer*, v (1884) pp. 57-61, Austin Dobson, "At Tully's Head" in *Eighteenth Century Vignettes* (2nd series, 1894), R. Straus, *Robert Doddsley, Poet, Publisher and Playwright* (1910).

DODSWORTH, ROGER (1585-1664), English antiquary, was born near Oswaldkirk, Yorkshire, the son of Matthew Doddsworth, registrar of York cathedral. He collected a vast store of materials for a history of Yorkshire, a *Monasticon Anglicanum*, and an English baronage. The second of these was published with considerable additions by Sir William Dugdale (2 vols., 1655 and 1661). The MSS were left to Thomas, third Lord Fairfax, who by his will bequeathed them (160 volumes in all) to the Bodleian library at Oxford. Portions have been printed by the Yorkshire Archaeological society (*Doddsworth's Yorkshire Notes*, 1884) and the Chetham society (copies of Lancashire post mortem inquisitions, 1875-1876).

DODWELL, HENRY (1641-1711), scholar, theologian and controversial writer, was born at Dublin. He became a fellow of Trinity college, Dublin, but having conscientious objections to taking orders he relinquished his fellowship in 1666. In 1688 he was elected Camden professor of history at Oxford, but in 1691 was deprived of his professorship for refusing to take the oath of allegiance to William and Mary. He retired to Shottesbrooke to study chronology and ecclesiastical polity.

His chief works on classical chronology are *A Discourse concerning Synchronation's Phœnician History* (1681), *Annales Thucydides et Xenophoniani* (1701), *Chronologia Græco-Romana pro hypothesebus Dion. Halicarnassensis* (1692), *Annales Velleiani, Quintilianei, Statiani* (1698), and a larger treatise entitled *De veteribus Græcorum Romanorumque Cycis* (1701).

DOG Although the word "dog" is believed to have been originally applied to a particular English breed, it is now used in a general sense to connote all the domesticated varieties of the zoological genus *Canis*, of which the wolf (*Canis lupus*) and the northern jackal (*Canis aureus*) of Europe and Asia are familiar wild species. The accepted zoological name is *Canis familiaris*.

Origin and Antiquity—The time that prehistoric man first domesticated a wild canine to serve as his hunting aid or cave guardian is unknown. The aboriginal peoples of Switzerland and Ireland used dogs for hunting and undoubtedly ate dog flesh long before they learned to till the soil. Cave drawings of the palæolithic era include hunting scenes in which the rough form of a

canine appears alongside the huntsmen. One of these drawings is estimated to be 50,000 yrs. old.

The question which naturally arises relative to such old drawings is whether the canines pictured can rightfully be called dogs. They undoubtedly were wild animals, probably wolves, which were taken into the cave man's abode as pets and nourished by bones and entrails of the animals eaten by the family. The domesticated canine probably learned that it was easier to procure food by accompanying the huntsman than by chasing and killing its own prey, thus becoming a hunting assistant and probably a guardian of its master.

The most commonly accepted theory of canine development is that the wolf was the main progenitor, with subsequent crossings with other wild canines. It is unlikely that the jackal was a contributor to the strain in view of the fact that the jackal's dental structure is different from that of the dog, whereas the teeth of the wolf are identical in every detail with those of the dog.

From the investigations of caves, middens and lake dwellings, it is known that Europeans of the new stone age possessed a wolf-like breed of dogs, and a similar breed has been traced through the successive ages of bronze and iron. But accurate information of the external form of domesticated dogs prior to historic times is not available. From the oldest records supplied by Chaldean and Egyptian monuments, it is manifest that several distinct varieties had been developed 4,000-5,000 years ago. Slender dogs of the greyhound type, and a short-legged breed of a terrier type are depicted in Egypt, and the Assyrians of about 600 B.C. had mastifflike hounds.

The early Greeks and Romans had dogs and mentioned them often in their literature. The Romans' canine classifications were similar to our modern groups. Both made distinctions between those which hunted by scent and those which hunted by sight, just as we divide hounds from hunting breeds. The Romans also had *Canes vulcanici* (housedogs) and *Canes pastorales* (sheep dogs) which compare to modern working dogs.

MODERN BREEDS OF DOGS

There are five main classes of dogs in addition to a miscellaneous sixth group. This division is based on the uses of the dogs—sporting dogs for hunting by air scent, hounds for hunting primarily by ground scent, terriers which hunt by going to earth, working dogs to serve as guards, guides and herders, toy dogs to serve as companions, and the miscellaneous or nonsporting group of dogs for a great variety of uses. This general classification applies to modern dogs all over the world. In 1945 there were 113 breeds in these 6 groups recognized in the United States.

The Sporting Group—(Wire haired pointing griffon, pointer, German short haired pointer, Chesapeake Bay retriever, curly coated retriever, flat-coated retriever, golden retriever, Labrador retriever, English setter, Gordon setter, Irish setter, American water spaniel, Brittany spaniel, clumber spaniel, cocker spaniel, cocker spaniel [English type], English springer spaniel, field spaniel, Irish water spaniel, Sussex spaniel, Welsh springer spaniel and Weimaraner).

The dogs in this group serve as hunters' assistants, mainly as finders and retrievers of small furbearers and fowl. The spaniels are the largest class of hunting breeds. The Irish were among the first users of spaniels, and the name indicates that they probably procured their original stock from Spain. The water spaniel was first printed in the Irish laws of 17 A.D. in a statement that water spaniels had been given as tribute to the king. Three hundred years later, during the period when Wales was overrun by the Irish spaniels are mentioned in Welsh statutes.

English literature of the 14th century mentions "spaniels," and they were used in falconry during the 16th century, probably to retrieve game killed or injured by the falcons. From the reign of Henry VIII there are records of payments made to "Robin the King's spaniel keeper."

The spaniel family is divided into those breeds which hunt and retrieve those which retrieve only and toy spaniels which do not hunt (see *Toy Dogs*, below). Most of the sporting spaniels, in-

cluding the cocker, springer and clumber range the hunting ground just ahead of the gunner. Their task is to range back and forth over terrain selected by the hunter, but always close enough to the gunner that the charge from his shotgun can kill the game which the dogs flush. Thus the spinnel may be close as 20 yds to the hunter, rarely more than 75 yds away. The reason that spaniels must hunt close is that they give no warning upon finding game—as do the pointing dogs, but immediately rout the game from cover. A well trained spinnel of this type hunts until he finds game flushes the game then immediately sits. For such a dog to chase in broad time is a serious hunting fault. If the game is killed the spinnel is ordered to find the dead bird or animal and return it to the gunner. Hunting spinnels of this type are trained to flush both furred and feathered game. They also can be trained to retrieve waterfowl from a hunting blind, the springer spaniel being especially adaptable for this work.

The Irish water spaniel despite its name, is usually classed with the retriever rather than the spinnels. It competes with the Labrador, Chesapeake Bay and other retrievers in usage.

A second group of gun dogs include the pointers and setters, which hunt up and down birds by pointing. Unlike the spinnels, which hunt close to the gunner, the pointing breeds range far ahead of the hunter as often out of sight. When they scent game they do not immediately flush the birds into the air, but stand motionless within a few feet of the game, their sensitive noses pointing toward the single bird or covey. They remain in this position until the hunter flushes and shoots the birds. A well trained pointing dog will hold such a point for a minute to two if his stand stumps, while the game is shot and wait for the hunter's command to find and retrieve the killed game.

Pointing dogs are of comparatively recent origin, their development paralleling the development of sporting firearms. Wing shooting came into popularity during the first decade of the 18th century, and from that period the rise of the "bird dogs" was marked. The dogs of the pointing group include the German short-haired pointer, the pointer, English setter, Irish setter, Gordon setter and Weimaraner.

Most of the pointing breeds were developed in the British Isles. The first of record were those used in England about 1650 for pointing hares. The English setter probably was developed from crosses of the Spanish pointer, the large water spaniel and the springer spaniel, and there is evidence that a distinct breed of the English setter type was used as early as 1582. It was not until about 1825, however, that the breed came into real prominence through the English sportsman, Edward Laverack, whose breeding practices standardized the appearance of the English setter.

The Gordon setter often is called the black and tan setter because of its coat colours. The breed never has approached the English or Irish setter or the pointer in popularity.

The Irish setter, red Irish setter, as distinguished from an earlier red and white breed, first appeared in Ireland early in the 19th century. In addition to being one of the most handsome of all breeds, the Irish setter is a capable field dog.

The retriever breeds are hunting specialists. Their job in the field is that of finding game which has been killed or wounded by the hunter and returning that game to their masters. During the hunting of upland game, retrievers often are worked with spaniels. The spaniels quarter the ground and "spring" the game while the retrievers are kept at the hunter's side. When game is downed the retrievers are sent out to do their specialized job.

The most common use of retrievers is in the hunting of waterfowl. In this type of sport the retrievers remain in the shooting blind until birds are killed, when they are ordered after the downed game. They retrieve equally well on land or water, being strong swimmers. The most popular retriever breeds are the Labrador, Chesapeake Bay and golden retrievers, and the Irish water spaniel. Other breeds used in this hunting work are the curly-coated and flat-coated retrievers.

The Hound Group—(Afghan hound, basenji, basset hound, beagle, bloodhound, borzoi, dachshund, Scottish deerhound, Amer-

ican foxhound, English foxhound, greyhound harrier, Norwegian elkhound, otterhound, saluki, whippet and Irish wolfhound.)

Most of the dogs of this group were developed for sporting uses, primarily to trail game by ground scents. The exceptions to this rule are the Irish wolfhound, borzoi and Scottish deerhound, all of which hunt large game primarily by sight.

The typical breeds of the hound group are powerfully built dogs with strong legs, long heads and muzzles, pendulous ears and pendulous upper lips or "flews." There was at least one hound type, called the St. Hubert, in France before the Conquest, and there are good reasons for the belief that English breeds of the present day are traceable to the importation of these dogs by King William I. From them were derived the talbot and the old English staghound, both now extinct, and the bloodhound which still survives. The bloodhound, which exhibits the hound characteristics of the head in the most exaggerated form, has the keenest scent of all dogs but is heavily built and lacking in speed. For these reasons the bloodhound has been weaned away from its original use as a sporting dog and now is used as a police aid in the trailing of criminals and lost persons.

There seem to have been other breeds in England in the middle ages known as the southern and northern hounds and in addition there was a large hound used for trailing deer and smaller hounds, principally harriers and beagles, used for hares. Harriers and beagles are miniature foxhounds in appearance, the beagle being the smallest of the true hounds.

The English country gentlemen of the middle ages were the prime developers of hound breeds, and the development of the breeds paralleled the hunting fancies of the times. Stag hunting and hare hunting were popular long before fox hunting became the vogue, thus harriers and beagles, which were followed on foot, are older breeds than the foxhound. The latter breed probably was developed by crossing one of the old English hounds of the bloodhound type with the greyhound to give speed in the pursuit of the fox in open country.

In the United States, the two most popular hounds are the beagle and the dachshund. Basically they are hunting dogs, and the beagle's popularity is due to its ownership by thousands of rural sportsmen for the hunting of rabbits. Single beagles commonly are used for this type of hunting, but they may be hunted in braces or in packs.

Short-legged and long-bodied hounds of the dachshund type were recorded in carvings in Egyptian monuments of the 15th century B.C., and there is evidence that Englishmen, as well as Germans and Italians, had a similar breed used in hunting during the 15th and 16th centuries, but it was in Germany that the breed was standardized in its modern conformation. The dachshund's popularity in the United States springs from the fact that it is a small, intelligent and friendly house pet. The breed is only occasionally used for hunting. Another of the hound breeds, the greyhound, is distinguished as one of the oldest of all established dog types.

The Working Group—(Alaskan Malamute, Belgian sheep dog, Bernese Mountain dog, Bouvier de Flandre, boxer, briard, bull mastiff, collie [rough], collie [smooth], Doberman pinscher, Eskimo, German shepherd, great Dane, Great Pyrenees, komondor, Kuvasz, mastiff, Newfoundland, old English sheep dog, puli, Rottweiler, Samoyede, schauzer [giant], Shetland sheep dog, Siberian husky, St. Bernard, Welsh corgi [Cardigan] and Welsh corgi [Pembroke].)

There is no doubt that the dogs of the working group have the greatest utilitarian value of all the modern canine classifications. Except in rare cases they are not used in sporting capacities. Instead, they work as police aids, draught animals, herders of livestock and guides for the blind.

In the police group are the boxer, Doberman pinscher, Rottweiler, German shepherd, great Dane and giant schnauzer, all of which are commonly trained to serve as sentry aids and guard dogs. In addition, the Airedale and standard schnauzer from the terrier group are similarly trained, and the bloodhound from the hound group serves often as a police aid for trailing duty. Thus all of these breeds may be considered "police dogs," a term often

mistakenly used to denote the German shepherd

Other breeds in the working division were developed as farmers' aids. This group includes the collie, puli, old English sheep dog, Shetland sheep dog, Belgian sheep dog, German shepherd and the corgi, all of which are herders. The Norwegian elkhound, from the bound group, also is used for herding duties. Almost every nation has its dog breed used for herding purposes. Thus we have the collie from Scotland, the puli from Hungary, the corgi from Wales and other imported breeds. The dog most commonly used on U.S. farms for herding work is an unrecognized breed unofficially called the American shepherd, English shepherd or border collie. It is a collie type, but has a shorter muzzle and smaller body, and usually is black and white in colour.

Sure-footed draught animals also are included in the utilitarian group of working dogs. Arctic explorations would have been impossible but for the Eskimo and Alaskan malamutes which pulled long sleds filled with necessary foods and supplies. Draught dogs also are commonly used in Belgium and the Netherlands.

A further subclassification of working dogs are the "rescue breeds"—the St. Bernard and Newfoundland. The former breed accompanies the monks of the Hospice of St. Bernard, Switzerland, to find helpless persons overcome during storms. The Newfoundland, a strong swimmer, is used to carry life lines to stricken vessels and to aid in the rescue of shipwreck survivors.

The activities of other working breeds, including guide dogs for the blind and modern war dogs, are included in later paragraphs.

The Terrier Group—(Airedale terrier, Bedlington terrier, border terrier, bull terrier [white], bull terrier [coloured], Cairn terrier, Dandie Dinmont terrier, fox terrier [smooth haired], fox terrier [wire-haired], Irish terrier, Kerry blue terrier, Lakeland terrier, Lhasa terrier, Manchester terrier, Norwich terrier, schnauzer [miniature], schnauzer [standard], Scottish terrier, Sealyham terrier, Skye terrier, Staffordshire terrier, Welsh terrier, West Highland white terrier.)

The terriers hunt by digging into the earth to root furred animals such as badgers, woodchucks, otters and many others. In some cases their duty is merely to force the furbearers from their dens in order that the huntsman can complete the capture. In other cases the terrier's job is to find and destroy the furbearers, either on the surface or underground. The word terrier is from the Latin *terra*, earth.

The terrier group includes breeds which differ so profoundly from each other that the extreme types have hardly a character in common. The terriers are linked with the mastiff group through the bull terrier, which originally was produced by crossing the bulldog with the white English terrier, a breed now extinct. With the hound group the terriers are connected through the Airedale, which resulted from a cross between the otterhound and a terrier of the Aire valley in England. Apart from their size, the original Airedales did not differ greatly from rough coated Welsh or Irish terriers.

England, Ireland and Scotland produced most of the terrier breeds. Among the breeds developed in England were the afore mentioned Airedale, Bedlington, bull terrier, fox terrier, Manchester and Staffordshire. Scottish breeders developed the popular Scottish terrier in addition to the Cairn, Skye, and West Highland white. Ireland's contributions to the terrier family include the Irish terrier and the distinctive Kerry blue terrier, whose coat ranges from light steel blue to very dark blue. The Sealyham and the Welsh terriers came from Wales. The standard and miniature schnauzers were developed in Germany, and the Lhasa terrier is of Tibetan origin.

The Toy Group—(Affenpinscher, Chihuahua, English toy spaniel, Brussels griffon, Italian greyhound, Japanese spaniel, Maltese, Mexican hairless, Papillon, Pekingese, miniature pinscher, Pomeranian, pug, toy Manchester terrier, toy poodle, Yorkshire terrier.)

All of the dogs in the first four groups, *i.e.*, the sporting dogs, hounds, working dogs and terriers, originally were bred for a specific purpose—to hunt, trail, root vermin, serve as protectors of livestock or humans or fill some other need. In most cases, how-

ever, the dogs kept in modern homes are kept primarily as pets, secondarily for the utilitarian purpose they can fulfill. Thousands of setters never are taken into the hunting field, thousands of sheep dogs never are used for herding stock, and only a comparatively few of the breeds developed as police aids are used for that work. These breeds are capable of such work if trained for it, but the modern dog serves mankind mainly as a companion and pet.

The dogs of the toy group make little claim to any value except as ideal house pets. Like most breeds, they develop a protective instinct which causes them to warn members of their masters' families upon the approach of a stranger, but aside from the performance of that valuable service they earn their keep by providing friendly companionship.

All of the dogs of the toy group are small, ranging from Chihuahua, which may weigh as little as 1 lb., to pugs which may range up to 18 lb. Most of the toy breeds are miniature counterparts of larger breeds. The English toy spaniels and Japanese spaniels, for example, are similar in conformation and physiognomy to the hunting spaniels. The Italian greyhound is a dwarfed specimen of the larger gazehound of the ancients. The Pomeranian is the smallest representative of the northern group, which includes the chowchow, Siberian husky, Laskmo, Norwegian elkhound, keeshond and schipperke. The toy Manchester terrier is the toy counterpart of the standard Manchester terrier.

It should not be assumed that toy breeds are new breeds. The Chinese are known to have kept "lion dogs" almost identical to the modern Pekingese as early as 2000 B.C. "Lap dogs" were popular during Caesar's reign. The forest laws written by Canute in the early years of the 11th century contained the provision that any dogs kept within 10 mi. of any of the king's forests must have their knee joints cut to prevent them from chasing game. An exception was made in the case of small dogs which could pass through a dog gauge, an oval ring 7 in. wide and 5 in. high.

Neither must it be assumed that all toy dogs are useless except as companions. As mentioned above, most dogs of the toy group develop a protective instinct after being in a home for a few months, thereafter serving effectively as sentries to warn of the approach of strangers. In many cases this instinct becomes so completely developed that toy dogs will attack intruders.

The Nonsporting Group—(Boston terrier, bulldog, chowchow, Dalmatian, French bulldog, keeshond, poodle, schipperke.)

In this miscellaneous sixth class of dogs are some of the most interesting of all canine types. Three of the eight breeds are of the bulldog family. These are the bulldog, Boston terrier and French bulldog. The distinguishing features of this family are the muscular neck and the strong jaws and teeth. The English-type bulldog was the first of the three modern bul dogs. This massive breed was mentioned in a book published in England in 1500, and probably was used at least two centuries before that in the sport of bullbaiting. In this activity, an English forerunner of bullfighting, a dog with strong jaws was needed to seize the bull by the nose and hold the animal close to the floor of the arena. This cruel sport was outlawed, but the massive and courageous bulldog was retained. The French bulldog is a comparatively new breed, having been developed by the French from small bulldog stock imported from England. The Boston terrier is one of the few breeds developed in the United States, crossbred by Robert C. Hooper, of Boston, in the mid 19th century.

The chowchow probably is the oldest of the breeds in the nonsporting group. A ban relieved due to the Han dynasty of about 150 B.C. pictures a chow in a hunting capacity. The modern chow is popular in England and the United States as a companion and guard dog.

Wild Dogs—Besides the wolves and jackals there are a number of other undomesticated dogs.

The Australian dingo (*g v u*) is about the size and build of a small German shepherd and is generally of a tawny colour, sometimes with the tail tip and feet white. It is believed to have been brought to Australia by the aboriginal peoples thousands of years ago. It hunts singly or (rarely) in packs and is destructive to

livestock. Dingos are easily domesticated and are used by the Australian natives to lead them in hunting kangaroos and other game. The dingo will readily cross with domesticated dogs.

The Asiatic wild dog or dhole (*q v*) is of the same general colour as the dingo but with its tail tip black, and it is slightly smaller in size. This animal is found from southern Siberia south through eastern Asia to Sumatra and Java. It hunts in packs and is very destructive to game.

The African hunting dog (*q v*) *hyaena* dog or *Lycan pictus* inhabits the plains of Africa. Its peculiar colour pattern reminding one of a tortoise-shell coat is a mixture of patches of yellow, black and white, no two individuals being identical. The large, rounded upstanding ears are also a characteristic of this animal. These dogs hunt in packs preying chiefly upon the many species of antelope which abound in Africa.

THE DOG'S SENSES

In most respects the dog's senses are considerably keener than man's. In hearing tests conducted by W. A. Engelmann, a German scientist, a German shepherd responded from a distance of 26 yds to a command which could not be heard by a man 64 yds away. The so-called "silent whistles" used by many trainers of hunting dogs demonstrate the great range of a dog's hearing powers. A man standing only a few feet away cannot hear the sound which emanates from these instruments, yet a dog will respond to the same sound from a distance of more than 75 yds. The reason for this is that the sound range of the human ear is restricted, whereas the dog can hear extremely high pitched tones from a considerable distance. These same tones are above the auditory range of the human ear.

The dog's nose is so sensitive that we are unable to conceive the great range of odours which canines detect. A piece of wood touched only by the tip of a master's finger can be selected by a trained dog from 20 other identical pieces. Bloodhounds have been known to follow perfectly the trail of a stranger 48 hrs after the path was traversed. There is no known method of measuring this sensitivity of the dog's olfactory powers, but it is among his strongest and most often utilized senses.

The dog's sight, on the other hand, is considerably weaker than man's, forcing the dog to use his keen senses of smell and hearing to make identifications. In one scientific test it was found that dogs could not distinguish between a 2 in. delta triangle and a 2 in. inverted triangle at a distance of 20 in. On the other hand, dogs have great sensitivity to movements, however slight. This ability to detect very slight motions explains the ability of stage dogs to solve problems in arithmetic. Such trained dogs bark the answers to addition and multiplication problems by following movements of the trainer's hand or jaw which cannot be detected by the human eye.

In another respect dogs' sight is inferior, in that they are colour blind. Their world is one of white, black, and shades of gray, and most tests indicate that their ability to differentiate between gray shades is inferior to that of man.

Guide Dogs for the Blind.—One of the most concentrated efforts to turn dogs to the use of man has been the training of thousands of guide dogs for the blind. The Germans led this movement by training several thousand dogs to guide soldiers who returned sightless from World War I. Nearly all other countries which participated in that war started similar training programs. In the United States the Seeing Eye foundation, Morristown, N. J., became the leading school for training guide dogs, several others were established in the middle west and western states.

The German shepherd is the breed most often used for this work about 90% of all US guide dogs being of this breed. Other breeds sometimes used are the boxer, Doberman pinscher and Labrador retriever. Bitches are preferred for guide service, but temperament is the guiding factor in selecting individual canines for the work.

Guide dogs wear a leather harness to which is attached a leather covered metal hoop which extends to the master's palm. The blind person holds this hoop lightly as the dog walks close to his legs, and is guided according to the pressure exerted by the

dog's movements as transmitted through the harness. The dogs guide their masters at about the same speed as that of the normal walker. They proceed largely without commands except for "right," "left," "forward" and "halt." They guide their masters around all holes and barriers and stop before going down or up a curb stone. After making such a stop the dog waits until the master determines the height of the curb and orders "forward." In addition to serving as a guide animal, the dogs perform such other services as picking up articles which the master may have dropped unintentionally. Such services are rendered without command.

A question commonly asked about guide dogs relates to their ability to follow red, green and yellow traffic signals. Inasmuch as dogs are colour blind, they obviously cannot interpret such signals. In fact, trained dogs do not watch traffic signals. They are trained to watch the flow of traffic and to guide their masters across streets when traffic permits safe movement.

The training of guide dogs is complicated for many reasons. These canines must be taught to judge, for example, the speed of approaching vehicles to determine if there is time to cross the street before the vehicle reaches the blind person's path. Similarly, they must be trained to judge heights to determine if the blind person can pass under a barrier or must walk around it.

Institutions which train guide dogs believe, with good reason, that the work of these canines provides psychological as well as economic benefits. Not only do the dogs give their masters almost complete independence of human aid, but in many cases have changed their masters' entire temperament and approach to life.

Dogs in World War II.—All of the major powers engaged in World War II used trained dogs in numerous capacities. The United States army organized a K-9 corps as a branch of the quartermaster department for the sole purpose of training dogs for war use. It is known that Germany had 40,000-50,000 trained dogs available for service at the start of the war and later gave Japan 10,000 of these. Russia and England also adopted dogs for military purposes.

US military dogs were put to use by all branches of the service—army, navy, marines and coast guard. The breeds wanted and approved by the armed forces for war dog training, as of 1943, were as follows: Airedale terriers, Alaskan malamutes, Belgian sheep dogs, Bouviers de Flandre, boxers, briards, bull mastiffs, Chesapeake Bay retrievers, collies (both rough and smooth), curly coated retrievers, Dalmatians, Doberman pinschers, English springer spaniels, Eskimos, flat coated retrievers, German shepherds, German short-haired pointers, giant schnauzers, Great Pyrenees, Irish water spaniels, Labrador retrievers, Newfoundlanders, Norwegian elkhounds, pointers, Rottweilers, Samoyeds, Siberian huskies, St. Bernards, standard poodles, wire-haired pointing Griffons, and crossbred dogs of any of the above breeds.

The major use of dogs trained for the military is that of aiding sentries. The canines are taught to accompany guard soldiers, either inside supply depots or outside military buildings or encampments. Under such conditions the dog is expected to range away from its handler, using its nose to find and rout any intruders. Other uses for which war dogs are trained are as messengers, detectors of machine gun nests, pack dogs, sledge dogs and first aid assistants.

FEEDING THE DOG

The basis of canine health is a proper diet. A well fed dog has the resistance to throw off minor diseases and resist major ailments. Similarly, a well fed dog is most likely to be active and alert, with clear eyes and a healthy skin and coat. Conversely, a poor diet may be the forerunner of many troubles, including diseases of the heart, intestines, lungs and skin.

In their natural state dogs are carnivorous animals. Wild canines live almost entirely on the flesh, skins and bones of animals which they catch. It therefore follows that meat is the prime requisite in the dog's diet, although the variations in the mode of existence between wild dogs and modern house pets

naturally requires that there be variations in their diet

Wild dogs, for example, require more food and a higher ratio of protein foods than do domesticated house pets, for the obvious reason that a wild dog utilizes considerable energy for chasing and killing the game which he eats, whereas the pet kept in a home gets his meals without effort

The meat which forms the backbone of the dog's diet may be supplied in one of several forms. It may be fresh meat, commercially-packed dog meat or dehydrated meat in biscuit form. Many large kennels which keep dogs in almost perfect condition for exhibition in shows feed almost no fresh meat, but depend upon commercially manufactured biscuit foods which contain dehydrated meat in addition to bone meal, corn and wheat products, soybean meal, dried milk, yeast, bran, cheese meal, fish meal, molasses and cod liver oil. Pet owners who keep only one dog in the house can economically follow the example set by the large kennels by feeding biscuit foods in conjunction with table scraps, milk and other beneficial dog foods. These prepared cereal foods may be fed dry, but are more palatable if softened with milk, hot water or broth.

Since the dog is primarily a carnivorous animal, vegetables must be considered as a subsidiary food in his diet. Vegetables may be fed to dogs in small portions and mixed with other foods. In almost every case they should be cooked and mashed, since the dog cannot digest vegetable chunks. Among the vegetables which, in small quantities, are beneficial to the dog are spinach, carrots, asparagus, beans, tomatoes and potatoes. Milk can be given to dogs of any age and is particularly beneficial to puppies just past the weaning stage. Among the foods which should be avoided are pork, uncooked fish and fowl.

A common query relates to the quantity of food to be given to a dog and the number of meals each day. Most veterinarians recommend that a puppy from 6 to 10 weeks old be given 4 meals a day at 4 hr intervals. Between the ages of 10 weeks and 6 months the dog can be fed 3 times a day at 5 hr intervals. After 6 months most dogs thrive on a light meal in the morning and a major meal in the evening.

There is no fast rule on the amount of food a dog should be given each day. Roughly, toy breeds require about $\frac{1}{2}$ lb of food per day, breeds weighing 10-20 lbs require about 1 lb of food, dogs weighing 20-50 lbs, about $1\frac{1}{2}$ lbs of food, and those weighing more than 50 lbs may consume 2-4 lbs of food per day. This schedule varies greatly, however, according to the temperament of the individual dogs. A very active terrier weighing only 20 lbs, for example, may eat as much as a 50 lb dog that has a placid temperament. The best rule is to watch the dog's actions to determine the amount of food he can assimilate. The owner should feed no more than the dog eats readily at each meal and naturally change or reduce the diet if the dog becomes overweight or underweight.

DOG AILMENTS

Distemper—Sometimes called "canine plague" because of its widespread occurrence and virulence, distemper is one of the most serious of all the diseases of dogs. The virus causing distemper is air borne, and can affect dogs of any age, although it is most serious in puppies under a year of age because these young dogs often do not have the strength to combat the disease.

The most common symptoms of distemper are discharges from the nose and eyes, an offensive odour of the skin, caused by slight skin eruptions, sneezing and coughing, loss of appetite and a general indication of waning strength.

Distemper is more easily prevented than cured. A series of three inoculations, given to puppies over three months of age by a veterinarian, provides dogs with almost complete protection.

Rabies—Rabies is an infectious disease affecting many warm-blooded animals, including man, in which case it is termed hydrophobia. It is more common in dogs than in any other animal because of their roving nature, but it can affect and be transmitted by rodents, cattle, horses, cats, monkeys and other animals. The usual method of transmission of the rabies virus is through the bite of an infected animal, in which case the rabies bodies in the

saliva of the infected animal are injected into the nervous system of the animal attacked. In rare cases the disease can be transmitted without biting taking place. This occurs if saliva from an infected animal enters the nervous system of another animal through a skin abrasion.

There are two types of true rabies in dogs. The first is dumb rabies, so called because the lower jaw of a dog thus affected becomes paralyzed, preventing barking and biting. The second type is violent rabies, the symptoms including extreme nervousness and biting of other animals without reason.

Veterinarians and scientists disagree as to the value of preventive rabies inoculations. Many US states require annual rabies inoculations. England has almost eliminated rabies by a strict quarantine law which bans dogs from the country until after six months of observation. The most certain method of protecting a family dog against rabies is to keep it under strict control, either on its home property or otherwise on leash, since the only manner by which it can contract the disease is through the bite of an infected animal.

There is no cure for rabies or hydrophobia, but it can be prevented by the Pasteur treatment, provided this treatment is started while the disease is in the incubative stage.

Internal Parasites—Several types of worms may be internally harboured by dogs. They can be inherited, but more commonly the worm *lurva* is taken into the dog's organs through its food. The most common internal parasites are roundworms, tapeworms, hookworms, whipworm and heartworm. The latter type is most common in the southern United States and usually is fatal.

Worms sometimes can be detected in the dog's bowel excretions, but a microscopic examination usually is necessary to determine the type of worms present. External indications of the presence of worms include excessive appetite, or almost complete lack of appetite, laziness, loss of weight, eye excretions and vomiting. These same symptoms also are present in other dog ailments, however, and therefore are not positive guides. The aforementioned microscopic examination of the dog's stool is the only definite proof of worm presence. Treatment for worms varies according to the types present, and should not be undertaken in the home without veterinary recommendations.

INDIVIDUAL BREEDS

Sporting Breeds—*Griffon* (*Wire Haired Pointing*)—A medium-sized dog developed in the last quarter of the 19th century. Primarily a pointing breed.

Pointer—One of the leading sporting breeds, and the first type of dog developed to stand game as we understand the term today. Originally used in England to point hares. The pointer probably was developed from foxhound, greyhound, bloodhound and spaniel blood. Common colours are white and black, white and liver, white and orange and white and lemon.

Pointer (German Short Haired)—A versatile breed developed in Germany about 1895 for pointing upland game and coursing furbearers and large game.

Retriever (Chesapeake Bay)—Hunters' retriever used for finding and delivering upland game and waterfowl. Developed in America.

Retriever (Curly-Coated)—First breed developed exclusively for retrieving game in the hunting field. First exhibited publicly in England in 1859.

Retriever (Flat-Coated)—Similar to the curly-coated retriever and developed at about the same time for the same uses.

Retriever (Golden)—Developed in England about 1870 from the Russian tracker breed, with bloodhound crosses.

Retriever (Labrador)—An all black, short-haired retrieving breed developed in England from stock imported from Newfoundland.

Setter (English)—One of the most popular game pointing breeds in the British Isles and the United States. Developed in England in the 15th century for pointing upland game birds.

Setter (Gordon)—Similar to the English setter and Irish setter, but black and tan in colour. Developed in Scotland, and

takes its name from the Duke of Gordon, a Scotch breeder of the late 18th century.

Setter (Irish)—A red or chestnut coated pointing breed developed in Ireland early in the 18th century.

Spaniel (American Water)—Similar to the Irish water spaniel, and used both for flushing and retrieving game.

Spaniel (Britany)—Developed in France, this is the only member of the spaniel family which points game.

Spaniel (Cumber)—A large and deliberate sporting dog, the Cumber was developed in England from spaniel and bissethound bloodlines.

Spaniel (Cocker)—In the 1940s the most popular breed in America being kept primarily as a house pet and hunting dog. Originally developed in England for hunting woodcock, hence its name. Specimens of this breed weigh 15-24 lbs and may be either solid coloured or in a colour.

Spaniel (Cocker—English Type)—Similar to the American-type cocker spaniel in conformation, colour and temperament, but slightly larger in size.

Spaniel (English Springer)—One of the most popular of the sporting dogs, of general use, the springer flushes and retrieves upland game and also retrieves in water. Dogs of this breed weigh 42-50 lbs and have the typical spaniel head and body conformation.

Spaniel (Fulld)—Dark coated hunting spaniel developed in England, weighs 35-50 lbs.

Spaniel (Irish Water)—Developed in Ireland in the first half of the 19th century. Tallest of the spaniels, the breed is used primarily as a retriever on land and water.

Spaniel (Sussex)—A determined and valuable hunter of upland game, the Sussex works more slowly and deliberately in the field than does the cocker or springer. Weighs 35-45 lbs.

Spaniel (Welsh Springer)—A red and white spaniel developed in Wales and used primarily in the British Isles for upland game. **Haimaraner**—A German breed similar in appearance to the short haired pointer. An all around hunting breed, but most commonly used for pointing upland game.

Hound Breeds—**Afghan Hound**—One of the oldest of all breeds, there being evidence that it was kept in Egypt 5,000 to 6,000 yrs ago. Later bred in northern Afghanistan, the breed hunts by sight.

Basset Hound—Developed in France, the basset weighs 25-40 lbs and is used in the United States for trailing foxes, rabbits, pheasants and raccoons.

Beagle—One of the five most popular breeds in America, the beagle is primarily a rabbit hunter and companion dog. Became popular during the Elizabethan period for hunting hares. May be hunted singly, in braces or in packs.

Bloodhound—One of the oldest of the scent hunting hounds, having been known in Italy as early as the 3rd century. The breed name is derived from the fact that it was one of the first of the "blooded" or purebred hounds, and its main modern use is that of trailing criminals or lost persons.

Borzo—Used as coursing hounds since the 13th century, the borzo also is called the Russian wolfhound. Large, angular canines, the borzo stand from 26-31 in at the shoulder and weigh 35-105 lbs.

Dachshund—One of the most popular of the hounds, the dachshund has the temperament, size and intelligence to qualify it as an ideal house pet. Developed in Germany to enter badger dens, hence its long body and short, powerful legs. The short haired variety is most common, but there also are long haired and wire-haired types.

Deerhound (Scottish)—As its name implies, this breed was used most extensively in Scotland and England for coursing deer. Completely established as a distinct breed in the 16th century.

Foxhound (American)—A variation of the English foxhound, and well established in the United States in colonial days. George Washington was one of the first U.S. enthusiasts of the breed.

Foxhound (English)—Somewhat larger than the American foxhound, and hunted in packs for trailing the fox. The most common colour combination for both the American and English fox-

hound is black, white and tan.

Greyhound—One of the oldest established breeds, having been established in Egypt between 4000 and 3500 B.C. and later favoured by the Greeks. Used for tracking all types of game, but most commonly used in hunting hares.

Harrier—One of the early hounds used in pack hunting, the harrier probably was introduced into England by the Normans. Similar to but smaller than the foxhound.

Norwegian Elkhound—Another of the ancient hound breeds, having been used by the Vikings as early as 4000 B.C. Has a thick, grey coat, and stands 18-20 in tall at the shoulder.

Otterhound—Hounds were used for killing otter in England as early as A.D. 1,000, and this breed was established for this type of hunting as early as A.D. 1300. A large, rough coated dog weighing up to 65 lbs.

Saluki—Perhaps the oldest known breed of domesticated dog, excavations of the Sumerian empire of 7000 to 6000 B.C. show canines of the saluki type. Similar to the greyhound in conformation, but with silky feathering on the ears and tail.

Whippet—The tastiest of all the small, domesticated animals, the whippet is similar to but smaller than the greyhound, weighing up to 28 lbs.

Wolfhound (Irish)—The tallest of all dogs, having a greyhound conformation. The Irish wolfhound was kept by Celts as early as 273 B.C.

Working Breeds—**Alaskan Malamute**—One of the oldest of the Arctic sled dogs. A heavy coated, compact dog weighing 85 lbs.

Belgian Sheep Dog—There are six varieties of Belgian sheep dogs, the Groenendael, a long coated black type, being the most popular. This variety weighs 50-55 lbs and is used mainly for herding.

Bernese Mountain Dog—One of the four varieties of Swiss mountain dogs, used mainly as a draught animal. Stands 21-27½ in high at the shoulder.

Bouvier de Flandre—A Belgian breed used as police and army aids. Usually fawn or black in colour, and stands 22½-27½ in at the shoulder.

Boxer—Related to other breeds of the bulldog type, having some terrier blood. The boxer is smooth coated, of medium size and handsome conformation. Excellent as a police aid and home protector.

Briard—A French breed known as early as the 12th century. A dark coloured dog standing 22-27 in at the shoulder. Used primarily as a sheep herder, guard dog and police aid.

Bull Mastiff—A massive short haired breed developed in England in the latter half of the 19th century by crossbreeding the mastiff and the bulldog.

Collie—The smooth coated collie and the more common rough coated collie are recognized as separate breeds. Both developed in Scotland in the 13th century, the former for driving sheep and the latter for guarding sheep.

Doberman Pinscher—A medium-sized guard dog and companion developed by Louis Dobermann, a German breeder, around 1890. Usually black and rust or rust in colour, short-haired and weighing 60-75 lbs.

Ekimo—One of the northern breeds, famed as a sledge dog. Has long hair and weighs 50-85 lbs.

German Shepherd—A leading working breed, having been used in herding, guard work, battlefield rescue missions, guiding the blind and police assistance. Has long hair, of almost all colours, and stands 22-26 in at the shoulder.

Great Dane—One of the largest of the modern breeds, having been developed in Germany to hunt boars. Probably has Irish wolfhound and old English mastiff blood. May be brindle, fawn, blue, black or black and white. Females measure more than 28 in at the shoulder, males 30 in.

Great Pyrenees—A large dog, usually white, most commonly used as a watch dog, companion and pack dog. Known in Europe more than 3,000 yrs ago and became a favourite of French royalty in the 17th century.

Komondor—One of the three breeds of Hungarian working

- 7 Cairn terrier
- 8 Airedale terrier

dogs kept mainly by shepherd of that country for protecting the flocks. An all white breed, with long hair, standing at least 23½ in at the shoulder.

Kuvass—Developed in Hungary in the 15th century from bears brought from Tibet the Kuvass was used for hunting big game, for guard duties and for herding purposes. All specimens are pure white, long-haired and stand 25-27 in at the shoulder.

Mastiff—A giant, short haired dog, with heavy head and short muzzle, which has been used in England for more than 2,000 yrs as a watch dog. A representative of the mastiff family known in Egypt as early as 3000 B.C.

Newfoundland—Originated in Newfoundland from forbear brought there by fishermen from Europe. A large, strong, active dog, black in colour and weighing 110-150 lbs. Landseer Newfoundland may be almost any colour, but usually are white with black or bronze markings.

Old English Sheep Dog—Developed in England early in the 19th century for driving cattle and sheep. Usually white with markings of grey, grizzle or blue, with long hair over entire body, including the head.

Puli—The third of the Hungarian working breeds, the puli is an alert, medium sized dog used primarily for herding sheep. Has a long coat, usually black, grey or white in colour.

Rottweiler—A large, mastiff-type working dog developed by German breeders from stock known to the Romans. Primarily a guard dog and cattle driver, the Rottweiler is black with tan markings and stands 21½-27 in at the shoulder.

Samoyede—An Arctic sledge dog, white in colour and weighing 36-55 lbs.

Schnauzer (Giant)—See Schnauzer under Terrier Breeds, below.

Shetland Sheep Dog—A miniature collier in appearance, this breed was developed in the Shetland Islands. Stands 12-15 in at the shoulder, and is usually sable, black or blue with markings of white and tan.

Siberian Husky—A sled dog developed in Siberia and commonly used in Alaska. Usually grey with white and black markings and weighing 40-65 lbs.

St Bernard—This breed has been kept by monks at the Hospice of St Bernard in the Swiss Alps since the latter part of the 17th century. It is massive, stands 25½-27½ in at the shoulder, and has red or brindle markings.

Welsh Corgi (Cardigan Type)—This breed was introduced to Wales by the Celts at about 1200 B.C. It is similar to the dachshund in conformation, but has a medium length coat and erect ears. Used for driving cattle.

Welsh Corgi (Pembroke)—Similar to the Cardigan type corgi in conformation, but having a short tail. Introduced into Wales by Flemish immigrants in A.D. 1107.

Terrier Breeds—**Airedale Terrier**—Developed by cross breeding the now extinct old English terrier with the otterhound. One of the largest of the terriers, black and tan in colour and weighing 38-45 lbs.

Bedlington Terrier—Developed about 1825 in Bedlington, Northumberland, England. Distinctive because of its sheep like appearance, it weighs 22-24 lbs and has a thick coat of light blue, liver or sandy hue.

Border Terrier—An active, game terrier weighing 11½-15½ lbs, with a head akin to that of an otter.

Bull Terrier—Developed early in the 19th century by cross breeding of the white English terrier, bulldog and Spanish pointer. There are two varieties—one all-white and the other any colour other than white or coloured with white markings. The weight of the standard varieties is 25-60 lbs.

Currier Terrier—One of the Scottish breeds, developed for routing otter, foxes and other furbearers. Females weigh 13 lbs, males 14 lbs, and may be any colour except white.

Dandie Dimont Terrier—A native of the borderlands between England and Scotland, first recorded as a distinct breed about 1700. Mustard or pepper in colour, dogs of this breed weigh 14-24 lbs.

Fox Terrier—One of the best known of the terriers being

popular in the United States, Britain and most of the nations of continental Europe. Developed by the English for routing vermin, the fox terrier may have either a smooth- or wire haired coat. White is the predominating colour, with dark markings. The fox terrier weighs 16-18 lbs.

Irish Terrier—An all red terrier, with a wire haired coat, this breed was developed in Ireland. Similar to the fox terrier in conformation, but somewhat larger, weighing 25-27 lbs.

Kerry Blue Terrier—Ireland's national dog having been developed in County Kerry before 1835. A distinctive breed, having a light or dark blue coat and weighing 32-38 lbs.

Lakeland Terrier—Similar to the Irish terrier in conformation but weighing only 16-17 lbs. Developed in the lake districts of England for routing fox and other dogs of this breed may be black and tan, grizzle and tan or blue, and tan in colour.

Lhasa Terrier—Developed in Tibet more than 800 years ago, the Lhasa terrier has a long, straight coat, usually of golden hue.

Manchester Terrier—The standard Manchester terrier weighs 14-22 lbs, when as the toy Manchester weighs 7-12 lbs. Both are black and tan in colour, short haired with somewhat roached backs. Developed in the Manchester district of England.

Norwich Terrier—A small, short-legged, wiry-coated dog used for routing foxes, the Norwich usually weighs about 11 lbs and is red, black and tan or grizzled in colour.

Schnauzer—There are three size varieties of this breed, the grint standing 21½-25½ in at the shoulder, the standard type measuring 17-20 in at the withers, and the miniature type 11½-13½ in at the shoulder. All are similar in conformation, with hard, wiry coats, rectangular heads and short tails.

Scottish Terrier—One of the earliest of the terriers indigenous to Scotland, this popular breed usually is black in colour, but may be wheaten, grey or grizzled. An active, short legged breed weighing 18-20 lbs and used for routing foxes, rodents and other furbearers.

Sealyham Terrier—A white terrier having conformation and size similar to that of the more common Scottish terrier. Developed in Wales between 1850 and 1890.

Skye Terrier—A short legged and long bodied Scotch breed, being about 9 in high at the shoulder, about 40 in long and weighing 16-18 lbs. The breed's coat is about 5½ in long and is blue, grey or fawn in colour.

Staffordshire Terrier—Similar to and related to the white bull terrier, but dark in colour, the Staffordshire weighs 35-50 lbs and was developed from bulldog and terrier blood.

Welsh Terrier—A squarely built black and tan terrier standing 15 in high at the shoulder and weighing about 20 lbs, this breed was developed in Wales for hunting the otter, fox and badger.

West Highland White Terrier—Of the Scottish family of terriers, this breed is all white and weighs 13-19 lbs. It has the conformation of most of the Scottish terrier breeds, with short legs and a short, cobby body.

Toy Breeds—**Affenpinscher**—A rare breed in America, somewhat similar to the more common Brussels griffon in appearance, the affenpinscher has a red or grey wiry coat, a distinctive "beard" and never exceeds 10½ in in height.

Chihuahua—The smallest of all breeds, weighing only 1-6 lbs, the Chihuahua is a native of Mexico. This breed should not be confused with the Mexican hairless, since it may be either short-haired or long haired.

English Toy Spaniel—A breed weighing 9-12 lbs, the English toy spaniel has a long silky coat and a head formation somewhat like that of the Pekingese. There are several varieties of this breed, including the Prince Charles, King Charles, Ruby and Blenheim, the main variations being in colour.

Griffon (Brussels)—Developed prior to the 17th century from the affenpinscher, the now extinct Belgian street dog, the Chinese pug and the Ruby spaniel, the Brussels griffon has a wiry, reddish brown coat and weighs 7-12 lbs.

Italian Greyhound—A small, short haired breed of typical greyhound conformation, the Italian greyhound has existed in its present form for more than 2,000 yrs. The average dog of this

breed weighs about 8 lbs

Japanese Spaniel—This breed is similar to the English toy spaniel in appearance, but is always black and white or red and white in colour. This spaniel has a head somewhat similar to that of the Pekinese, its coat may be profuse or short and its average weight is about 7 lbs

Maltese—This breed, somewhat like the Skye terrier in conformation and type of coat, was developed on the island of Malta more than 2,800 yrs ago. Its coat is white and long, and it weighs 2-7 lbs

Mexican Hairless—A rare breed, probably having descended from the hairless dogs of China. These dogs were established in Mexico by the Aztecs. Not to be confused with the Chihuahua, which is a distinct breed

Papillon—A member of the toy spaniel group of dogs which probably was developed in Spain but attained its greatest popularity in France during the reign of Louis XIV. A small breed, predominantly white with patches of other colours

Pekinese—One of the most popular of the toy breeds the Pekinese originated in China before the 8th century. It has a pug type head, including a very short flat nose. The profuse Pekinese coat may be any colour, and specimens of the breed weigh under 14 lbs

Pinscher (Miniature)—Similar to the more common Doberman pinscher in conformation and coat, but weighing only 6 to 10 lbs this breed was developed in Germany

Pomeranian—One of the northern breeds, being related to the chowchow, Alaskan malamute and Norwegian elkhound, the Pomeranian was developed in Pomerania, Germany. Ideal specimens of the breed are compact short-coupled, weigh about 7 lbs and have profuse coats and plume tails of varying colours

Pug—A short faced dog which probably originated in China, the pug is a squat, cobby breed which weighs 14-18 lbs and has a short coat which is silver or apricot fawn in colour

Toy Manchester Terrier—See Manchester Terrier under Terrier Breeds, above

Toy Poodle—See Poodle under Non Sporting Breeds, below
Yorkshire Terrier—Probably a descendant of the Skye terrier, having been developed in the Lancashire and Yorkshire areas of England, this small terrier type has a long straight coat which often touches the ground and usually is dark blue mingled with fawn or bronze

Nonsporting Breeds—**Boston Terrier**—One of the few breeds developed in America, the Boston terrier became one of the most popular of U.S. dogs. It was developed in Boston in the middle of the 19th century by crossbreeding the English bulldog and the white English terrier. The breed is compactly built, with a square skull, bulldog-type face, brindle and white or black and white in colour, short coat and a weight of about 12-25 lbs

Bulldog—An English breed originally used in baiting and fighting bulls. Like other members of the bulldog family, this breed has a short, broad face with protruding lower jaw, a deep-set nose, massive neck and body and rather short, strong legs. Females of this breed weigh around 40 lbs, males 10 lbs more

Chowchow—One of the oldest dog breeds, the chow was standardized in China as early as 150 B.C. It has a large, massive head, flat skull, short nose, deep-set eyes and erect ears. Its coat is abundant, outstanding and may be any solid colour

Dalmatian—A medium sized, short-haired dog, white spotted with black or liver, this breed gets its name from Dalmatia, on the eastern shore of the coast of Venice. The Dalmatian weighs 35-50 lbs

French Bulldog—This breed probably was developed of miniature bulldog stock sent to France from England. Specimens are similar to the more common English bulldog in conformation but are smaller, weighing less than 28 lbs, and have erect ears

Keeshond—One of the northern breeds, related to the Samoyede chowchow, and Pomeranian the keeshond is considered the national dog of Holland. It has a short, compact body, small erect ears, fox like head and a dense grey coat. The breed height is 17-18 in at the shoulder

Poodle—Although the poodle probably was originated by the

Germans, it attained its greatest popularity in France and some times is called the "French poodle". The standard poodle stands more than 15 in at the shoulder, the miniature poodle less than 15 in, and the toy poodle never exceeds 12 lbs. All three types may be any solid colour

Schipperke—A native of the Flemish provinces of Belgium, the schipperke is all black, tailless and weighs up to 18 lbs. It has a small foxlike head and is alert and active

DOGE, the title of the chief magistrate in the extinct republics of Venice and Genoa. For the character of the office at Venice see the articles *COMMUNE Medaevae*, BUCENTAURO. In Genoa the institution of the doge dates from 1339. At first he was elected without restriction and by popular suffrage, holding office for life, but after the reform effected by Andrea Doria (q.v.) in 1528 the term of his office was reduced to two years. At the same time plebeians were declared ineligible, and the appointment of the doge was entrusted to the members of the great and the little councils, who employed for this purpose a machinery almost as complex as that of the later Venetians

See B. Cacciatore, *Il Doge di Venezia* (1864), E. Muscati, *Storia della promozione ducale* (Padua, 1888), and H. F. Brown, *Venice a Historical Sketch* (1893)

DOG-FISH, a name applied to several species of the smaller sharks, perhaps because of the habit these fishes have of pursuing or hunting their prey in packs. The European small spotted dog fish or rough hound (*Scylium canalicula*) and the large spotted or nurse hound (*Scylium catulus*) keep near the sea bottom, feeding chiefly on the smaller fishes and crustacea. They differ from the majority of sharks in being viviparous. The eggs are enclosed in semi-transparent horny cases, often called "mermaid's purses" and these have tendril like prolongations from each of the four corners, by means of which they are moored to sea weeds or other fixed objects, until the young dog fish is ready to make its exit

The larger of these species attains a length of 4 to 5 ft, the smaller rarely more than 30 in. The picked dog fish (*Squalus acanthias*) is abundant in the temperate seas of both hemispheres, and on both sides of the Atlantic. It attains a length of 4 ft, but the usual length is 2 to 3 ft, the female, as in most sharks, being larger than the male. The body is round and tapering, and the mouth is placed ventrally some distance from the end of the snout. There are two dorsal fins, each armed anteriorly with a sharp spine. This species is viviparous, the female producing five to nine young at a birth, the young when born are 9 to 10 in long and similar to the parents, except in size. The picked dog fish is gregarious, and is abundant at all seasons everywhere on the British coasts. They, even more than other dog-fish, are the special enemies of the fisherman, injuring his nets, removing the hooks from his lines, and spoiling his fish. They are eaten, both

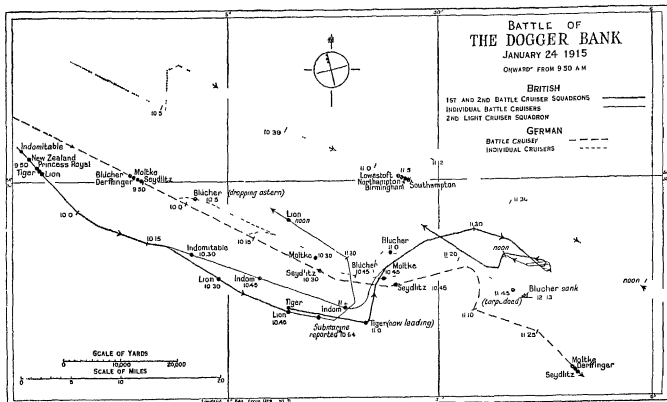

CHART OF STEAMING TRACKS OF BRITISH AND GERMAN BATTLE CRUISERS IN ACTION
Admiral Beatty with the 1st and 2nd battle cruiser squadrons surprised Admiral Hipper commanding the German 1st scouting group near the Dogger Bank in the North Sea on Jan. 24, 1915. A running fight ensued the German squadron making for port under full steam as soon as they sighted Beatty's ships. The "Blücher" was finally sunk by two torpedoes from the "Arctura" and the "Seydlitz" was seriously damaged. The approach of the German High Sea Fleet enabled Hipper to escape without further loss. German casualties were 954 killed, 90 wounded, and 189 taken prisoner; the British 15 killed and 32 wounded.

fresh and salted, on the west coast of England, and are sold regularly in the French markets. The bowfin, an unrelated American fresh water fish is also called "dog fish" (*See* SELACHIANS, BOWFIN, FISHES).

DOGGER BANK, an extensive shoal in the North Sea, about 60 m. E. of the coast of Northumberland, England. The depth of water, in some parts only 6 fathoms, is generally from 10 to 30 fathoms. It is well known as a fishing ground. The origin of the name is obscure, but the middle Dutch *dogger* signifies a trawling vessel, and was formerly applied to two masted vessels employed in the North Sea fisheries, and also to their crews (doggermen) and the fish taken (dogger-fish). Off the south end of the bank an engagement took place between English and Dutch fleets in 1781. Here on Oct. 21, 1904, during the Russo Japanese War, some British trawlers were fired on by the Russian Baltic fleet. An acute crisis between Britain and Russia followed. The affair was settled by an international commission which reported on Feb. 25, 1905. Compensation was paid by the Russian government.

BATTLE OF THE DOGGER BANK

This naval action was fought during the World War on Jan. 24, 1915, near the Dogger Bank in the North Sea between British and German battle cruisers and light forces.

Reports from America at this time had led the Germans to think that a plan for blocking their harbours was afoot and Rear-Admiral Hipper was despatched at nightfall on Jan. 23 to reconnoitre off the Dogger Bank. His force consisted of four battle-cruisers of the 1st scouting group, "Seydlitz" (flag), "Derfflinger," "Moltke" and "Blücher," with four light cruisers and 19 destroyers. Before the ships left the Jade, their strength and intentions had been revealed by their own wireless and Vice-Admiral Beatty left the Forth to intercept them at 6 P.M. on the 23rd. With him were the five battle-cruisers of the 1st and 2nd Battle Cruiser Squadrons, the "Lion" (flag), "Tiger," "Princess Royal," "New Zealand" and "Indomitable," and the four light cruisers of the 1st Light Cruiser Squadron under Commodore W. E. Good-

enough in the "Southampton." He was to proceed to a rendezvous in lat. 55deg 12min north, long 3deg 12min east, 180m from Heligoland, where he was to meet Commodore Tyrwhitt with three light cruisers and 30 destroyers of the Harwich force. The 3rd Battle Squadron, of seven "King Edwards," left Rosyth and Admiral Jellicoe put to sea from Scapa with the battle-fleet at 9 P.M. In heavy guns Beatty's force was decidedly superior, mounting 24 13.5-in and 16 12-in against Hipper's 8 12-in, 20 11-in and 16 8.2-in.

The Fight Begins.—Beatty reached the rendezvous at 7 A.M. It was a crisp winter morning with a calm sea and good visibility. The battle cruisers were in single line ahead with Goodenough's light cruisers two miles on the port bow. Course was then altered to south by west at 18 knots. Ten minutes later "Arctura," Tyrwhitt's flagship, was sighted southeast about seven miles on the port bow. She had hardly been identified when the flash of guns was seen to the south south-east. "Aurora," some 15m behind Tyrwhitt, had met and engaged the German light cruiser "Kolberg" on the port bow of Hipper's squadron coming from the southeast. Each received a couple of hits and "Kolberg" retired at 7 25 A.M.

At the sound of the guns, Beatty ordered the light cruisers to chase to south. "Southampton" had barely gone two miles when she sighted "Aurora" on her starboard bow and, a few minutes later, German battle-cruisers on the port bow to the south-east. Dense clouds of smoke were pouring from their funnels and they were evidently raising steam for full speed. It was then 7 50 A.M. Beatty's appearance had come on Hipper as a surprise and, turning to the southeast, the latter ran for home.

Pursuit of the Germans.—At 8 30 A.M. Beatty's position was lat. 54deg 50min north, long 3deg 40min east, and the two had settled down to a long rush towards Heligoland, 140m away. The British battle cruisers were in single line ahead on a south-east by south course, working up to full speed. Hipper was 11m sharp on "Lion's" port bow, in full flight on a south south-east course. In speed Beatty's squadron had a decided superiority. It was

Ben, especially written for him, in Congreve's *Love for Love*, with which the theatre opened (1695), and next year played Young Hobb in his own *The Country Wake*. He was associated with Cibber and others in the management of the Haymarket and Drury Lane, and he continued to play comedy parts at the former until his retirement in 1713. In 1715 he founded the prize of "Doggett's Coat and Badge," "in commemoration of his Majesty King George's happy Accession to the British Throne." The prize was a red coat with a large silver badge on the arm, bearing the white horse of Hanover, and the race had to be rowed annually on Aug. 1 on the Thames, by six young watermen who were not to have exceeded the time of their apprenticeship by twelve months. The names of the winners have only been preserved since 1791. The race is still rowed each year, but under modified conditions. The date of his death is variously given as Sept. and Oct. 1721.

See *Thomas Doggett, Deceased* (1908).

DOG LICENCES. The great growth of dog keeping is revealed by the record of the dog licence duties, which show that the dog populations have become enormous. In Great Britain dogs over six months old must have a licence which costs 7s 6d a year. Dogs used as guides by blind persons, sheep and cattle dogs, and hounds under 12 months old which have not hunted, are exempt. In 1936, 2,932,612 dog licences were taken out, but it is probable that there are about four million dogs in Great Britain. The penalty for non compliance with the law is a fine up to £5. The licences are issued at post offices, and their revenue goes to the local authorities in whose areas the receiving post office is situated. The law requires also that dog collars should be engraved with their owners' names and addresses, but it is not strictly enforced. In Great Britain there is no way of telling if a particular dog is licensed or not.

In the Irish Free State dogs must be licensed when one month old and in Northern Ireland when six months old, in each case the licence costs 5s.

In the British overseas Dominions dog licensing is general. In Canada each province by statute empowers its municipalities to impose a dog tax. Thus in Ontario the licence costs \$2 for a dog and \$4 for a bitch, a higher duty being imposed when more than one animal is kept. In Australia licences vary little, in Victoria all dogs are taxed at 5s a year, in South Australia a dog is licensed at 5s, a bitch at 7s 6d. All dogs must wear a collar or tag unless kept for hunting or coursing. In South Africa the tax is high, being 12s 6d in Natal and 10s in the Transvaal, where there is a £5 tax on all dogs with a greyhound strain that can be used for hunting.

In Germany all dogs are taxed, the amounts varying in the different districts, being usually small in villages and high in the big towns, and the law is strictly enforced. In Berlin the dog tax is £3 in English money. Sheep dogs on German farms go free of tax. A metal disc bearing the number of the licence must be attached to each dog's collar.

In the United States licences are issued variously by a State, county or municipality. Enforcement of the ordinances requiring registration of dogs is usually within the police powers conferred upon local corporations, but some States, such as Pennsylvania and Connecticut, have general laws on the subject. Registration of dogs above the age of six months, except those in kennels, for which there are special regulations, is usually required annually. A stated fee is paid to the city, county or State officer for the licence, the applicant receiving a tag which must be attached to the animal's collar as evidence of such registration. In case the tag is lost, a duplicate may be obtained, but failure to register a dog, under most ordinances, authorizes the officers to kill it.

DOGMA, DOGMATIC THEOLOGY. Theology, like political economy, has no technical terminology, but seeks to use the language of ordinary life in a specialized sense. Colloquially, to assert dogmatically is contrasted with speaking tentatively. But also, dogmatism is contrasted with proof. "I'm not arguing with you, I'm telling you"—he who so speaks is, reasonably or unreasonably, dogmatic. The claim of accuracy akin to that of science and of authoritativeness akin to that of law, are the two poles of

the universe of dogma. In the New Testament the word means decree, although the Greek fathers early misunderstood it. The older philosophical use, for the leading and inviolable principles of any system, is best illustrated by the *Ipse dixit* of the Pythagoreans, whatever their master had said was final. German theologians have sought to define the word for their own purpose by drawing a line round those doctrines which deserve to be called dogmas and by separating them from the region of open questions. According to W. Herrmann (opening p. of *Dogmatik in Die Kultur der Gegenwart*), "We must not mainly understand by a 'Dogma' a definition upon Church authority. Such a definition is only the last stage in a long process, which has all along been actuated by the thought of a *revealed doctrine*. And that conception is the main element in 'Dogma'." In contrast with this F. I. Loofs (*Leitfaden zum Studium der Dogmengeschichte*, ed. 4, p. 9) holds that "Dogma is those affirmations of religious faith whose acknowledgment a Church expressly requires from its members or at least from its teachers." Harnack in his great *History of Dogma* prefers a more historical definition. Dogma is (1) a creation of Greek thought on the soil of the gospel and (2) kindred mediaeval findings, but (3) it is transformed or disappears in Protestantism through deepening religious insight, in Socinianism and the Enlightenment through the dominance of rationalism, in the post Tridentine church through more sweeping exercise of authority. Each of these definitions has its merits. Something is to be said also for the view that, in the modern Church of Rome, we have dogmatism superlatively developed—partly just because that Church forbids one to draw a hard and fast line separating dogmas from pious opinions, or formulated dogmas from unformulated, all the Church's teaching being infallibly and dogmatically true. The choice of a definition can only be made by balancing advantages against disadvantages.

As to dogmatic theology, all that need be said is that it is the most widely accepted name for the systematic statement of Christian doctrines—and not merely of dogmas, if dogmas are to be separated off from the floating mass of theories.

When the Church inherited the Jewish scriptures, it took over an instalment of dogma, and one beset for it by special difficulties too little recognized by theologians—a book holy and divine, and yet not the perfect revelation of God! When, in controversy with Gnosticism, a collection of New Testament writings was added to the "Old Testament," the inheritance grew, and the dogmatic postulate, that all scriptures contain the same teaching, became no easier to vindicate. One cannot deny that Calvinism in the past or that Fundamentalism in the present is in a very high degree dogmatic. I or each of these, the corpus of scripture is the sum total of dogma, and to the scripture every thought of man is to bow. The Catholic ethos adds other things—an emphasis on sacraments, a gathering up of the contents of the Bible (with unconfessed modifications) into creeds, a franker announcement of church authority. In these features of Catholicism there appears to be a fuller realization of the dogmatic temper than where appeal is made to the Bible alone.

Harnack has good reason for insisting on the fundamental importance of the great Eastern dogmas, Trinity and Incarnation. These expressed the piety of Eastern Catholicism, and they passed into the mediaeval West and even into historic Protestantism as presuppositions—only presuppositions, but as such indispensable. And yet, in their original shaping, the West had played no small part, when curiously hard questions were raised by the East. It has been felicitously observed that "the East thought that everything could be explained, and the West, that nothing needed to be explained." Even at the first General Council (Nicaea, 325) it appears certain that Western minds brushed aside Eastern scruples in imposing the watchword "homousios"—a term with questionable associations, but a term which not even the slipperiness of the Arians could evade. So again, at Chalcedon (451) and at the First Trullan Council (680), the West threw in the dogmatic watchword round which crystallization ensued. The Councils of Constantinople (381) and Ephesus (431) were more Eastern. The adoption of a non-Biblical phrase at Nicaea, constituted a landmark in the growth of dogma, it is true, since

the Church—the universal Church speaking by its bishops—says so, though the Bible does not! Even at Nicea there was a small obstinate minority. Oliver Wendell Holmes draws the inference that Catholic unanimity means "a majority vote" (followed by excommunication of the few). Similarly, from Nicea onwards, formulated dogma is accompanied by anathemas. We have good reason for including in our definition of dogma this mark—dogma (for all who receive it) is an affirmation which it is sinful to deny, or to challenge, or to ignore. It is a singularly ominous claim.

Another landmark is established for us by the so-called Athanasian creed—a (probably later) Western summary and elaboration of Eastern creeds, with two well marked divisions concerning the Trinity and concerning the Person of Christ. It is "before all things" necessary to be accurate in minute detail regarding these doctrines. Sacraments are not so much as named. Indeed except in the "one baptism for the remission of sins" of the "Nicene-Constantinopolitan" creed, the great early creeds are strangely silent concerning sacraments, although no Catholic mind could ever doubt that it is he that believeth and is baptized who shall be saved. In one sense, then, the Athanasian creed marks a climax. It puts the claim of dogma amazingly high. Though it has not forgotten that Christ is "to judge all men according to their own works" orthodoxy is "before all things necessary."

Yet the mediaeval West goes on to alter the balance of emphasis in several ways. First, it works out the theory of sacraments in fuller detail—numbers them as seven, specifies them one by one, includes in its findings the staggering miracle of transubstantiation. And in all these points the East accepts results from the West. Sacraments will not save if an *obex* or hindrance is wilfully interposed (e.g., by deliberate purpose of mortal sin), and the doctrine of reception *in toto*—heaven taking the will for the deed—seems to shake the theory to its foundation. But the emphasis is laid upon the necessity of sacraments, even at the expense of doctrine. For, secondly, implicit faith may suffice lay Christians—my possibly suffice many of the clergy. It is a popular error, though shared by some well educated persons, to speak of implicit "obedience." *Fides implicita* is the correct phrase. By assenting in general terms to Church teaching, while believing explicitly the minimum creed of Heb. xi. 6, one believes by implication whatever else *de fide*. We even meet with the position that there is merit before God in believing heretically, if one honestly supposes that one's heretical view is taught by the Church. All this is a notable counter stroke to the detailed dogmatism of the Athanasian creed. One understands the motives at work, but it is not with God that "we have to do," still less with conscience, but with—the Church. There is no shadow of excuse in the theory for dissent from Church teaching. Ignorance is encouraged, bad mistakes are excused, but submission is exacted to the uttermost.

The third mediaeval innovation is the Thomist doctrine of mystery. While reason and conscience warrant theistic belief, revelation includes things which reason cannot grasp. Again one comprehends the motive, but again one observes how the significance of the Church is aggrandized by the new doctrine. An enemy might say that doctrines which are "mysterious" in the technical sense are the fossilized remains of what once was living thought. We have a formula, true, but what does the formula contain? No child of the Church dare seek to answer. If the progress of dogmatic definition means the condemnation of views which in the past were innocent, the goal of the dogmatic progress seems to be altogether beyond the region of knowledge.

Genius in Protestant theology was confined almost entirely to Luther, and even he in later life stifled and hidred. When he proclaims that justification by faith is in itself the *crucialis stantis vel cadentis ecclesiae*—article is a frequent synonym for dogma—he is seeking to gather up a multitude of authoritative dicta in one thrilling personal experience. So too, when he graduates the books of the New Testament he is claiming to go beyond the letter even of scriptural authority in the strength of his knowledge of the gospel of salvation. In words of his which are written on his monument at Worms and which might be called the undying charter of evangelical Protestantism: *Those who rely*

know Christ cannot be caught in the snare of any human authority. While Luther was incomparably the most daring, all the early reformers hesitated over the great Greek dogmas, but all alike brushed their hesitations aside, and remposed upon the modern time the presuppositions of their fathers. Similarly, the Protestant doctrine of inspiration grew steadily harder. An imperfect but valuable attempt to construe Christianity as a thing of experience was made by Schleiermacher, and the school of Ritschl has even more carefully sought after "Anschluss an Luther." Historically it is a fair question whether Protestant evangelicalism ought to speak of dogmas at all. This means that doctrine is for it a less thing than Christian life, and that "we know in part."

The Council of Trent (1545-63) for the first time dogmatically places unwritten tradition side by side with scripture, it also subordinates scripture text and interpretation to the Church's authority. After the period of general relaxation in the 18th century, movements of reaction everywhere set in. In the Church of Rome Pius IX. (1854) proclaimed *de suo* the Immaculate Conception of the Virgin, and the Council of the Vatican (1869) recognized the Pope's personal authority as equal to that of any council. In quaint technical language, his formal pronouncements are "irreformable." Thus dogma makes quite clear that the "development" of which J. H. Newman and others speak is purely one of accretion. Nothing can be cancelled. Nothing can be bettered—it is divinely perfect. Alike in 1854 and in 1870, the *decreta* claim to reiterate a "divinely revealed doctrine" or "dogma." The Vatican council also makes Thomist apologetic *de fide* (1) Theism is demonstrable. But (2) there are unintelligible mysteries in revealed faith. The former position seems highly complicated. It is now a dogma that dogmatic revelation *quasi*, reason itself proves the being of God, if you hesitate over *quasi*, *anathema sit*. The highroad of reason is prescribed to you authoritatively, and the goal is also prescribed. If your reason does not lead you to the goal, *anathema sit*. And if you fail to recognize mysteries above "though not contrary to" reason, *anathema sit*.

When for the first time a closure was introduced into the House of Commons, Lord Salisbury "did not believe the Liberals were sharpening a scimitar in order to cut bread and butter." The Church of Rome since 1871 has possessed the keenest possible cutting weapon, but has cut with it—nothing. The dogmatic impulse seems to have temporarily exhausted itself in placing the Pope upon his pinnacle.

At the opposite theological extreme from Roman Catholicism, radical Protestantism shows a germ or a vestige of dogma, or at any rate a rare parallel to dogma, if it asserts (with G. B. Foster) *the Finality of the Christian Religion*.

It has been proposed by an eminent scientific writer, Dr. Whitehead, that we should speak of the "dogmas" of science, and should recognize that these must from time to time be "changed." Apparently, the first principles underlying scientific theory are working hypotheses. Such things of course are endlessly modifiable. But a student of theology must hold that it will not tend to clearness of thought if working hypotheses are called "dogmas."

LITERATURE—Matthew Arnold's *Literature and Dogma* (1873) is important for literary usage. J. A. B. Bruce, *Chief End of Revelation* (Classical and early Christian usages, E. Hatch, *Hibbert Lect.* (1888), pp. 119, 120; J. B. Lightfoot on Colossians ii. 14 (10), W. Schmidt, *Dogmatik*, vol. I (1895)—many quotations in *extenso*, C. Stange, *Der Dogma und seine Beurteilung in der neueren Dogmengeschichte* (1898)—a pamphlet protesting against what Loofs terms the "generally accepted view" Articles in the (Roman Catholic) *Kirchenlexikon* of Wetzer and Welte, 2d ed. (by Hergenrother and Kaulen), 1883-1901. Arts "Dogmatik" (J. Kostlin), "Dogmengeschichte" (F. Loofs) in Herzog-Hauck's *Encyclopädie der protest. Theol.* (vol. IV, 1898). Art "Glaubensartikel" in previous ed. (Herzog-Potter, vol. V, 1879). J. M. E. McGreggor's *Some Dogmas of Religion* interprets dogma as claiming ultimate absolute truth. (See also *THEOLOGICAL*) (R. MA.)

DOGMATISM is the uncritical acceptance and application of any belief, especially of those ultimate or fundamental beliefs

known as principles. The term has been applied by Kant (*q.v.*) to most preceding systems of philosophy because of their alleged neglect to examine "critically" the nature and bounds of human knowledge as a preliminary step to their construction.

DOGON (less correctly **HABBE**), a tribe of Sudinese Negroes inhabiting the mountainous country around Bandiagara and Hombori about 120 mi S.W. of Timbuktu, where they have maintained a fortified redoubt of paganism for many centuries against the pressure of the great Islamic and other empires which have flourished in the surrounding region during the past millennium. Their organization is theocratic and hierarchical, closely conditioned by a highly integrated complex of philosophical and cosmogonic ideas under sacred priest chiefs (*Hogon*), whose lives are completely governed by ritual. The tribal religion is based largely on the cult of the ancestors, and Dogon wood carvings, representing ancestors, are among the finest specimens of African art, the style being abstract, as is normal in Sudanese sculpture. Masked ritual dances are organized by the men's societies on the occasion of funerals and initiations and at a ceremony in expiation of the original sin of the tribal ancestors, the masks being markedly architectural in character. The dead are buried in holes in the cliff face.

See M. Griaule, *Maques Dogons* (Paris, 1938); D. Paulme, *Organisation sociale des Dogons* (Paris, 1940). (W. B. F.)

DOGRA, an inhabitant of the Duggar tract in the foothills now mostly comprised in the Jammu territory of Kashmir, India. Duggar appears to mean the "land between two lakes," as the original home of the Dogra people was situated between the lakes of Siroensar and Mansar. Sanskritized as Drigarh desh, it is unknown to literature. The Duggar is inhabited by a number of castes, including Brahmans, about five classes of Rajputs with numerous septas and the usual undercastes. The Dogra who enlists in the Indian army is or should be a Rajput of some degree from this or the adjacent sub-Himalayan tracts. He is an excellent soldier. The Dogra regiments acquired their high reputation in the first Sikh war.

DOGS, ISLE OF, a district of east London, Eng., on the north bank of the Thames, forming the southern extremity of the metropolitan borough of Poplar (*q.v.*). It is enclosed on three sides by a bend of the Thames formed by Limehouse, Greenwich and Blackwall reaches, and includes Millwall (with Millwall dock) on the west and Cubitt Town on the east, the West India docks across its northern end make of it almost an island. Greenwich tunnel (built in 1902) on pedestrians passes under the river there. The whole district is occupied by docks, riverside works and houses for the workers.

The origin of the name is not certain, until the 16th century the area was known as Stepney Marsh, the present name may have originated as a nickname of contempt.

DOG STAR see **SIRIUS**

DOG'S-TOOTH VIOLET, any plant of the genus *Erythronium* of the lily family (Liliaceae) comprising about 15 species, all except one, North American. They are low herbs with unbranched stems which spring from deep corms and bear near the surface of the ground a pair of unequal leaves, often mottled with dark blotches, and large, nodding, lily-like, mostly solitary flowers on slender stalks. The European dog's tooth violet (*E. dentatum*), the only old world species, a delicate spring bloomer, with rose purple flowers, is planted in borders and rockeries. The best known representative in eastern North America is the yellow

ing, projecting triangles, called, from its saw tooth shape, in French, *dent de scie*. Early examples of this decoration are found in Syria and in the Mesopotamian valley, e.g. in the palace front at Rabbath Ammon (built either in the last years of the Sassanian dynasty or in the early part of the Mohammedan rule), where it is used on arch moldings, and in a highly decorative form, in the palace of Machuta of the 8th century. It is found widely during the Romanesque period throughout Europe where it is thought to have been introduced by the Crusaders from the east, and is particularly common in Norman work in France and England, appearing as the chevron (*q.v.*) and zigzag. It often appears in arch moldings as a series of projecting pyramids the sides decorated with foliage. To its supposed resemblance, in this form, to a dog's tooth violet, some people incorrectly attribute the origin of its name.

DOGWOOD, the name applied to shrubs and small trees of the genus *Cornus*, of the family Cornaceae, comprising some 60 species which, except for a single Peruvian species, are found in north temperate regions. They are mostly hardy shrubs, usually with handsome foliage and attractive flowers and fruits. Several are widely cultivated as summer and autumn ornamentals and also for the winter effect of their brightly coloured branches. The common European dogwood, prickwood, skewerwood, cornel or dogberry (*C. sanguinalis*), is a shrub reaching a height of 8 ft or 9 ft, and is commonly found in hedges, thickets and plantations in Great Britain. Its branches are dark red, the leaves, egg-shaped, pointed, about 2 in long by 1½ in broad, turn red in the autumn, the flowers are dull white, borne in terminal clusters. The berries are small, of a black purple colour, bitter and one seeded, and contain a considerable percentage of oil. The white wood is very hard, and, like that of various other dogwoods, is used for making ladder spokes, wheelwork, skewers, forks and other implements.

About 20 species are native to North America, mostly found east of the Rocky mountains, only 6 occurring on the Pacific coast. Of these the most striking are the flowering dogwood (*C. florida*), of the eastern and southern United States, one of the most beautiful of American flowering trees, and its very similar counterpart, the western dogwood (*C. nuttallii*), of the Pacific coast. The wood of the former is used for shuttles. Both are usually small trees 10 ft to 15 ft high, but occasionally 40 ft or more, bearing in early spring a profusion of flower heads each surrounded by four flowering bracts (involucre) 1 in to 3 in long, usually white but varying to rose red, giving the head the appearance of a flower 2 in to 5 in across. The red flowered forms of *C. florida* are extensively propagated for ornament. Other well known North American species are the red osier dogwood or kinnikinnick (*C. stolonifera*), found across the continent, the silky dogwood (*C. amomum*), the pruned dogwood (*C. paniculata*), and the alternate leaved or pagoda dogwood (*C. alternifolia*), natives of the eastern states and adjacent Canada. There are also two low, almost herbaceous, species—the dwarf cornel or bunchberry (*C. canadensis*), found from Newfoundland to Alaska south to Virginia and California, and the northern or Lapland cornel (*C. suecica*), native across Canada and northward of the Arctic zone, also in Scotland, northern Europe and Asia. Both bear clusters of brilliant red fruits, those of the latter are eaten by the Eskimos.

The widely planted Cornelian cherry (*C. mas*), a native of Europe and northern Asia, is a handsome shrub with glossy foliage, clusters of yellow flowers, and shining scarlet edible fruits which are made into preserves. The Japanese Kousa (*C. kousa*) native to eastern Asia, with creamy white flowering bracts 3 in across and fruits united in a globular head, is also grown as an ornamental shrub. The Jamaica dogwood, the root bark of which is poisonous, is *Ichthyomethus piscipula*, of the family Leguminosae. (E. S. H.)

DOHERTY, CHARLES JOSEPH (1855–1931), Canadian politician, was born at Montreal on May 11, 1855, and educated at McGill university. Called to the Quebec bar in 1877, he became a Q.C. in 1887 and was a puisne judge of the superior court of Quebec from 1891 to 1906. He was first elected to the

house of commons is a Conservative member for the St. Anne's division of Montreal in 1908 and became minister of justice in Sir Robert Borden's government in 1911. In 1917 he held until 1917. He joined the Unionist government in Dec. 1917 and, as acting prime minister and minister of justice, he had the difficult task of administering the Military Service Act. In 1918 he accompanied the prime minister to the peace conference at Paris, and in 1920 was one of the Canadian representatives at the League of Nations. He was appointed to the privy council, London, in the same year.

DOHERTY, HUGH LAWRENCE (1875-1919), English lawn tennis player, was born at Cliphtham, London, on Oct. 5, 1875. He was educated at Westminster school and Trinity College, Cambridge. At Cambridge he and his brother, Reginald F. Doherty (187-1911) made their names as tennis players. They were undoubtedly among the greatest and most trusted players of their day, and their joint work *On Lawn Tennis* (1903) is a classic of the game. The elder brother held the All England singles championship at Wimbledon from 1897-1900 and the younger from 1902-06 when he resigned the title. Playing in doubles the brothers were champions from 1897 to 1905, being only once defeated, by S. H. Smith and F. L. Roseley in 1902. H. L. Doherty won the U.S. national championship in 1903. He died Aug. 21, 1919.

DOHNANYI, ERNST VON (1877-) Hungarian composer, pianist and conductor, was born at Bratislava (Pressburg) on July 27, 1877. He studied at the Budapest Royal Academy, and was for a short time a pupil of Eugen d'Albert. He attracted notice by his first pianoforte quintet as early as 1895. He was appointed professor of the pianoforte at the Berlin Hochschule (1908) and director of the academy at Budapest in 1910. He became conductor of the Philharmonic orchestra of Budapest, and conducted with notable success in the U.S. The style of his compositions is conservative and individual and carries on the romantic traditions of the 19th century. Among his principal works are *Der Schläfer der Pierrette* (ballet pantomime), *Tante Simona* (comic opera, 1912), *Der Turm des Wundwunders* (opera, 1922), also orchestral and chamber music and songs, all of a high order and giving him a place among the first composers of his day.

As a pianist Dohnányi also took high rank.

DOHRN, ANTON (1840-1909), German zoologist, was born on Dec. 29, 1840, at Stettin, the son of Karl Dohrn, coleopterist, and editor of *Monatsschrift für Entomologie* (16 vol., 1846-66). After studying at Jena, under Ernst Haeckel, he devoted himself to the investigation of marine animals, and in 1870 founded the famous zoological station at Naples. He died on Sept. 26, 1909, at Munich. His publications are *Untersuchungen über Bau u. Entwicklung der Arthropoden* (1870), *Der Ursprung der Wirbelthiere* (1875), and *Studien zur Geschichte des Wirbelthierkörpers* (1888).

See *Science* new series, vol. 34 (Nov. 10, 1911).

DOIRAN, BATTLE OF, 1917. This abortive offensive by the British on the Doiran sector on April 24, 1917, and the subsequent attempts are described under SALONIKA CAMPAIGNS. The British forces were there launched against the most formidable positions with the idea of easing the way, by attracting enemy reserves, for a decisive Allied stroke elsewhere—an attack which was suspended almost before it began.

DOL, a town of northwestern France, in the department of Ille-et-Vilaine, 36 mi. N. of Rennes on the Ouest Etat railway. Pop. (1946), 4,008. The town was unsuccessfully besieged by William the Conqueror, taken by Henry II in 1164 and by Guy de Thouars in 1204. In 1793 the Vendéens there defeated the republican forces who had taken refuge within its walls. The bishopric was suppressed in 1790. Dol is situated to the southwest of the rich agricultural district known as the marsh of Dol, where market gardening is especially flourishing. Picturesque houses of the 14th and 15th centuries still stand with projecting upper stories. The gray granite cathedral, mainly 13th century, dedicated to St. Samson, is interesting for the English character of its design, for its stained glass windows of the 13th century

and for the finely sculptured tomb of Bishop Thomas James (d. 1504). About 1½ mi. from the town is the *piere du Champ Dolent*, a menhir about 30 ft. in height, not far off stands the great granite rock of Mont Dol, more than 200 ft. in height, surmounted by the statue and chapel of Notre Dame de l'Espérance. Dol has trade in grain, vegetables and fruit, and there are salt marshes. Tanning and leather currying are carried on.

DOLABELLA, PUBLIUS CORNELIUS, Roman general and son-in-law of Cicero, was born about 70 B.C. In the civil wars he at first took the side of Pompey, but afterward went over to Caesar and was present at Pharsalus. To escape the demands of his creditors he introduced (as tribune) a bill proposing that all debts should be cancelled. This was resisted by his colleagues and led to disturbances in Rome. Caesar, on his return from Alexandria, seeing the expediency of removing Dolabella from Rome, took him as one of his generals in the expedition to Africa and Spain. On Caesar's death Dolabella seized the consulship (which had already been conditionally promised him), and, by making friends with Brutus and the other assassins, was confirmed in his office. When, however, M. Antonius offered him the command of the expedition against the Parthians and the province of Syria he changed sides at once. His journey to the province was marked by plundering, extortion and the murder of G. Trebonius, proconsul of Asia, who refused to allow him to enter Smyrna. He was thereupon declared a public enemy and superseded by G. Cassius (one of the murderers of Caesar), who attacked him in Laodicea. On the capture of the place, Dolabella ordered one of his soldiers to kill him (43). Throughout his life he was a profligate and a spendthrift.

DOLCE, LODOVICO (1508-1568), prolific but mediocre Italian writer, was a native of Venice. He wrote on many subjects, but is remembered chiefly for his *Marianna*, a tragedy from the life of Herod, and for five comedies, *Il Ragazzo* (1541), *Il Capitano* (1545), *Il Martirio* (1545), *La Fabbrica* (1549) and *Il Ruffiano* (1551).

See A. Salza, *Delle commedie di Ludovico Dolce* (1899), Irene Sanesi, *La Commedia*, vol. 1, 251 ff. (Milan, 1911).

DOLCI, CARLO or CARLINO (1616-1686), Italian painter, was born in Florence on May 25, 1616, and died there on Jan. 17, 1686. He was a disciple of Jacopo Vignali, and when only 11 years of age he attempted a whole figure of St. John and a head of the infant Christ. His portrait of his mother displayed a new and delicate style which brought him extensive employment at Florence and in other parts of Italy.

Carlo Dolci holds somewhat the same rank in the Florentine school as Sassoferrato does in the Roman school. Without the possession of much genius, invention or elevation of type, both these artists produced highly wrought pictures, extremely attractive to some tastes. Many of his pictures represent the patient suffering of Christ, or the sorrows of the Mater Dolorosa. Dolci was, in fact, from early youth, exceedingly pious, it is said that during Passion week every year he painted a half-figure of the Saviour. Among his best works are the "St. Sebastian", the "Four Evangelists", at Florence, "Christ Breaking the Bread", in the markets of Exeter's collection at Burlington, the "St. Cecilia" in Dresden, an "Adoration of the Magi", and especially "St. Andrew praying before his Crucifixion", in Florence, his most important composition, painted in 1646. There are examples also in the National gallery and Dulwich gallery, London, and at Rome, Vienna, Munich, Berlin and Leningrad.

DOLDRUMS, an area or belt of calms or very light winds in certain equatorial regions, especially over the oceans. In the days of sailing vessels these areas were avoided, if possible, by mariners lest they find themselves becalmed for days or weeks, feeling uncomfortably warm in the still, humid air, losing time and consuming provisions and water. Hence, to be "in the doldrums" means to be "in the dumps."

(H. R. B.)

DOLE, SANFORD BALLARD (1844-1926), jurist and statesman of the Hawaiian Islands, was born in Honolulu on April 23, 1844, the son of American missionaries. After studying law in Boston he returned to Hawaii to become one of its leading lawyers, a member of the legislature from 1884 to 1887, and a leader in the reform movement which secured the constitution of 1887. Also in 1887 he was appointed an associate justice of the supreme court, which office he held until the monarchy was overthrown in 1893 by a revolution of which Dole was himself a leader. In 1894 he was elected by the constitutional convention as the first president of the Republic of Hawaii. With firmness and wisdom he guided the republic through a difficult period, suppressing revolutions and stabilizing the governmental machinery. When President Cleveland demanded the restoration of Queen Liliuokalani to the throne Dole refused to yield, claiming that Cleveland was without authority to act. In 1898 he went to Washington in the interests of annexation, and when that event took place in 1900 Dole was appointed by President McKinley as the first territorial governor. In 1903 he became United States district judge of Hawaii and in 1909 was reappointed to a second term. At its expiration in 1915 he retired to private life in Honolulu, where he died on June 9, 1926.

DOLE, a town of eastern France, capital of an *arrondissement* in the department of Jura, 29 mi. S.E. of Dijon on the Paris-Lyon railway. Pop. (1946) 18,250. Dole, the ancient *Dola*, was in Roman times the meeting place of several roads, and considerable remains have been found there. In the later middle ages, till 1648, it was the capital of Franche-Comté and seat of a *parlement* and a university, but in 1479 the town was taken and destroyed by Louis XI. It subsequently came into the hands of Maximilian of Austria, and in 1530 was fortified by Charles V. In 1668 and 1674 it was captured by the French and lost its *parlement* and university, both of which were transferred by Louis XIV to Besançon. Dole occupies the slope of a hill overlooking the forest of Chaux, on the right bank of the Doubs, and of the canal from the Rhone to the Rhine which accompanies that river. The steep, narrow streets contain many old houses recalling, in their architecture, the Spanish occupation of the town. The church of Notre Dame is Gothic of the 16th century. The college, once a Jesuit establishment, contains the library and a museum of paintings, and has a chapel of the Renaissance period, the *Hôtel Dieu* and hotel de ville are both 17th century buildings, and the law court occupies an old convent of the Cordeliers. In the courtyard of the hotel de ville stands an old tower dating from the 15th century. The birth of Louis Pasteur (1822) in the town is commemorated by a monument, and there is also a monument to Jules Grevy. Dole is the seat of a subprefect and has tribunals of first instance and of commerce. Metal-founding and the manufacture of pumps, kitchen ranges and other iron goods, chemical products, machinery, blue and blacking, and pastry are among the industries. There is a good trade in agricultural produce and livestock, and in wood, iron, coal and the stone of the vicinity. Much wine is produced in the district.

DOLE, a portion, a distribution of gifts, especially of food and money, given in charity (OE *dol*, cf. mod. "deal"). The distribution of alms to the local poor at funerals was a universal custom in the middle ages. Thus in 1309 Eleanor, duchess of Gloucester, ordered in her will that 15 poor men should carry torches at her funeral, "each having a gown and hood lined with white, breeches of blue cloth, shoes and shirt, and £20 amongst them." Later, doles usually took the form of bequests of land or money, the interest or rent of which was to be annually employed in charity. Often the distribution took place at the grave of the donor. Lenten doles were also formerly common. A will of 1537 bade a barrel of white herrings and a case of red herrings be given yearly to the poor of Clavering, Essex, to help them tide over the fast. A pilgrim's dole of bread and ale can be claimed by all wayfarers at the Hospital of St. Cross, Winchester. This is said to have been founded by William of Wykeham. Emerson, when visiting Winchester, claimed and received the dole. What were known as "scrambling doles," so called because the meat and bread distributed were thrown among the poor to be scrambled

for, were not uncommon in England. At Wath, near Ripon, a testator in 1810 ordered that 40 penny loaves should be thrown from the church leads at midnight on every Christmas Eve. The best known dole in the United States is the "Leake dole of bread." John Leake, a millionaire, dying in 1792, left £1,000 to Trinity church, New York, the income to be laid out in wheaten loaves and distributed every Sabbath morning after service. (X)

Dole in Unemployment—While, as explained above, a dole is strictly a charitable gift, usually of food, the term came in Great Britain after World War I to be applied loosely to the various kinds of weekly payments to the unemployed.

These payments were first made on a national scale under the out-of-work donation scheme which was instituted immediately after the Armistice in 1918, and inasmuch as the scheme was entirely noncontributory, the term "dole" might be regarded as not inappropriate. The expression "dole" in relation to donation payments obtained currency soon after the scheme began.

The scheme applied not only to unemployed former members of the forces who had served during World War I, but to civilian unemployed workers also. The payments came wholly from the exchequer and amounted to £62,448,000 (£40,723,000 to former members of the forces and £21,725,000 to civilians). The scheme for civilians was in existence for the year Nov. 1918 to Nov. 1919. For former members of the forces it continued until March 1921.

By what may be described as a natural, or at least an easy, transition the term "dole" was afterwards applied to the weekly payments made under the National Unemployment Insurance scheme (see **UNEMPLOYMENT INSURANCE**). This general scheme of insurance against unemployment was, however, on a contributory basis from its inception. The contributing parties were the employer, the employed person, and the exchequer, the share of the contribution borne on national funds being only one fifth of the whole. (The exchequer share was later increased and in the year 1930 amounted to one third of the whole.)

From 1920 to Dec. 1929, over £284,000,000 was contributed by employers and workers and over £110,000,000 by the exchequer.

Unemployment Benefits Subscribed For—The unemployment insurance scheme was launched on what may be called a strictly insurance basis, persons who contributed to it being entitled when unemployed to receive benefit in proportion to their contributions, subject to a maximum period in each year. However, because the scheme came into operation just when the severe industrial depression began, it became necessary to graft on to it a supplementary scheme under which benefit might be drawn by persons who would normally have contributed to the scheme but who, because of the slump, either had not paid a sufficient number of contributions or had exhausted their benefit rights. The term dole was soon commonly applied to this extra or uncovenanted benefit and it almost inevitably became associated with the insurance scheme as a whole, to which, however, as an insurance scheme it is quite inappropriate.

The term was also applied to payments by the Poor law authorities for relief of the able-bodied unemployed—an application which, having regard to the nature of the payments, is more justified than one referring to the unemployment insurance scheme.

Generally, it may be said that after 1919 the term dole was loosely applied to payment made from national or local funds to the unemployed and even to benefits paid from insurance funds to which the recipients themselves contribute heavily. By mid century the term was only occasionally used.

(J F G P, X)

DOLERITE is a term used in England though seldom elsewhere for medium coarse-grained intrusive or hypabyssal rocks of the composition of basalt, and with optically texture. In other words, for rocks which in the United States are called diabase.

The history of the term *dolerite* (*δολερίτης*, deceptive) is long and involved, and is closely tied up with that of diabase (*q.v.*). It was first used by René Just Haüy some time prior to 1819 for a compact rock composed of feldspar and augite. To this definition Karl C. von Leonhard in 1823 added that the texture is that of a basalt whose granularity is megascopically visible. In other words,

fine grained extrusives were called basalts, and the coarser varieties dolerite. Ten years later, Von Ikenberg inserted between the dense basalt and the coarse grained dolerite the term intermediate (*azureros*), in the middle for the fine grained varieties, in deciding that he considered the three the same except for texture. All these were included by John McCulloch under the old Swedish name trapp. I. Sandberg in 1870 separated his basalts from his dolerites by the presence of ilmenite, as is necessary in the latter and magnetite in the former, but Hugo Bucking showed that titanium is present in both.

Simply for a coarse grained basalt the term has been used occasionally in Germany, although Harry Rosenbusch did not use it in his classification, while Ferdinand Zirkel used it in the same in his classification. In England S. Allport in 1871 determined to drop the word diabase from his classification for he considered the basic, aegitic rock—multiphase, aphanitic, dyke, and gneiss—was in nothing but chloritized rocks, and proposed to group them under the generic name dolerite.¹ The use of the word dolerite and the limiting of the term diabase to decomposed rocks came about gradually in England. It was used by J. J. Harris Feil in 1888 but Alfed Harker in 1902 still considered diabases as intrusive bodies of hypabyssal pyroclastic rocks. He considered them equivalent in composition to gabbro or basalt, but characterized by their ophtic texture. He also said that some English writers had "inconveniently" employed the name diabase for a more or less decomposed dolerite. In 1908, however, Harker substituted "dolerite" for "diabase" in his definition, otherwise, word for word, the two are identical. He now said that diabase was in part synonymous with dolerite but regarded the word objectionable and dropped it. Arthur Holmes in 1920 said that in general dolerite is distinguished from basalt by its coarser grain, the absence of glass, its holocrystalline character and the ophtic texture.

Comparative Uses of the Terms Diabase and Dolerite in the United States, Germany and Great Britain

Country	Intrusive (with ophtic texture)	Extrusive			
		Crane	Fine	Pre Tertiary	Altered
United States	Diabase (modern use)	Basalt	Basalt	No age classification used	No special name
Germany	Diabase by Zirkel, 1866	(Dolerite)*	Basalt	Diabase (Rosenbusch)	Diabase (general usage)
Great Britain	Diabase by Harker, 1902; dolerite by Harker, 1908	Dolerite generally, Allport, 1874	Basalt	No age classification used	

*Not in common use at present.

† Diabase is often used for the altered rocks, primarily because the Palaeozoic rocks are usually so altered.

‡ Presumably diabases would be included also under the term dolerite.

From Albert Johannsen in *Journal of Geology*, Univ. of Chicago Press

For a rock of the alkali series, intermediate in composition between a trachyte and a dolerite, but containing more labradorite than orthoclase or anorthoclase, and usually carrying a small amount of a feldspathoid, H. Rosenbusch proposed the name trachydolerite. The term, however, has been used with several meanings, and it is questionable whether it should be retained. BIBLIOGRAPHY.—Albert Johannsen, "On the Use of the Terms Diabase and Dolerite," *Journal of Geology*, vol. xxv, pp. 270-275 (1927), 4. Descriptive Petrography of the Igneous Rocks, vol. iii, pp. 291-296, 311-318 (1937). Complete references to the literature are given.

(A. J.)

DOLET, ÉTIENNE (1509-1546), French scholar and printer, was born at Orléans. After studying at Paris and Padua, he became secretary in 1530 to the bishop of Limoges, who was French ambassador to the republic of Venice. He then studied law at Toulouse. In 1535 he entered the lists against Erasmus in the famous Ciceronian controversy, by publishing a *Dialogus de similitudine Ciceroniana*; and the following year saw his *Commentarii linguae Latinae*. This work was dedicated to Francis I, who gave him the privilege of printing during ten years any works in Latin, Greek, Italian or French, which were the product of his own pen or had received his supervision, and accordingly, on his release from an imprisonment occasioned by his justifiable homi-

cide of a printer named Compaign he began at Lyons his typographical and editorial labours. He started by publishing a *Cato christianus* as Christian moralist, in which he made profession of his creed. The catholicity of his literary appreciation, in spite of his ultra Ciceronianism, was soon displayed by the works which proceeded from his press—ancient and modern, sacred and secular, from the New Testament in Latin to Rabelais in French. After being thrice imprisoned for atheism, he was tortured and burnt at Paris on Aug. 3, 1546. On his way to the stake, he is said to have composed the punning pentameter—*Non dolet ipse Doli, sed pia turba dolet*.

Whether Dolet was a Protestant or an anti-Christian rationalist is debatable. He was condemned by Calvin but many of his books were of a religious character and he repeatedly advocated the reading of the Scriptures in the vulgar tongue.

See A. F. Didot, *Essai sur la typographie* (1852), L. Michel, *Dolet* (1880), R. C. Christie, *Étienne Dolet, le Marin of the Renaissance* (2nd ed. 1889, bibli.), O. Galtier, *Étienne Dolet* (1908), and pt. 3 of J. C. Prevost's *Toulouse in the Renaissance*, (1912).

DOLGELLY, market town, urban district and the county town of Merionethshire, Wales, on the streams Wnion and Aran, at the north base of Cader Idris, on the G.W. railway. Pop. (1918) 2,461. Area 1.8 sq. mi. It consists of small squares and narrow streets, with a grammar school (1665), market hall and assize hall. There is a little manufacture of flannel and coarse woollens. An ancient house has associations with Owen Glendower, who established relations with the continent from here in 1404. Hengwrt, a mansion near the ruins of Cymmer abbey, has given its name to a famous collection of Welsh MSS. once housed there, and now in the National Library of Wales, Aberystwyth.

DOLGORUKI, VASIL LUKICH, Count (1672-1739). Russian diplomatist and minister, was one of the first group of young Russians whom Peter the Great sent abroad to be educated. On his return home he entered the diplomatic service, and served on a series of important missions. During the reign of Peter II (1727-30) Dolgoruki was appointed a member of the supreme privy council, and, after procuring the banishment of Menshikov, he took charge of the young emperor, whom he would have forced to marry his niece Catherine but for Peter's sudden death. He then drew up a letter purporting to be the last will of the emperor, appointing Catherine Dolgoruki his successor, but had to abandon the scheme as impracticable. He supported the election of Anne of Courland to the throne on condition that she first signed nine "articles of limitation" which left the supreme power in the hands of the Russian council. Anne, who repudiated the "articles" on the first opportunity, never forgave Dolgoruki. He was banished first to his country seat and then to the Solovetsky monastery. Nine years later the charge of forging the will of Peter II was revived, and he was beheaded at Novgorod on Nov. 8, 1730.

See Robert Nisbet Bain, *The Pupils of Peter the Great* (1895).

DOLHAIN, a town of eastern Belgium, situated on the Vesdre, northeast of Verviers and close to the German frontier. It is quite a modern town, occupying the site of the lower town of the ancient city of Limburg, which was destroyed by Louis XIV in 1675. On a rocky eminence above Dolhain are still to be seen the fine ruins of the old castle of Limburg, the cradle of the ancient family of that name from which sprang the Luxembourg family and several emperors of Germany. At a short distance from Dolhain is the famous dam of the Gileppe, the vast reservoir constructed to supply Verviers with water free from lime for its cloth manufactures.

DOLICHOCEPHALIC, having a relatively long head. In anthropology, it denotes a cephalic index of 75 or less (see ANTHROPOMETRY, CEPHALIC INDEX, CRANIOMETRY). In obstetrics the term is applied to a head which is temporarily elongated, usually by moulding from a long and hard labour. (F. L. A.)

DOLLAR, small burgh, Clackmannanshire, Scotland, 6 mi. N.E. of Alloa by the L.N.E.R. Pop. (1938) 1,428. The well known academy is housed in a fine mass of buildings of the Grecian order (opened c. 1819). Castle Campbell, a stronghold of the Argylls from the late 15th century, is an imposing ruin.

DOLLAR, originally a silver coin current in many European countries, and later any of several silver coins. The Spanish peso,

or piece of eight which circulated in the Spanish American and English colonies, was known as a dollar by the English speaking peoples, although the term does not seem to have been in use among the Spanish speaking peoples. Familiarly during colonial times with this coin resulted in the official designation of the United States monetary unit as the dollar. Other countries, notably Canada, also chose the dollar, but these of course are not synonymous with the U.S. dollar. Monetary arrangements differ from country to country and change within countries with the passage of time. Consequently, dollar has a wide range of meanings.

The word itself is a modified form of a Germanic word "thaler," a shortened form of "Joachimsthaler," a 16th century silver coin intended to be the equivalent of the gulden, a gold coin. The Joachimsthaler was first struck in 1519 under the direction of the count of Schlick, who had appropriated a rich silver mine discovered in St. Joachimsthal (Joachim's dale), Bohemia. The coin bore an effigy of St. Joachim, hence the name. It was also known as the "Schlickenthaler." Many of these coins were struck and they were current in Germany from the 16th century onward. Thaler as a name for a silver coin became general, with various modifications such as daler, dalar, dhalder, taller, etc. Only in 1873 was "thaler" replaced by "mark" as the name of the German monetary unit.

The United States dollar was defined in the law of April 2, 1792, as either 24.75 gr (troy) of fine gold or 371.25 gr (troy) of fine silver. Provision was made for a one dollar silver coin with a bullion content slightly less than that of the Spanish dollar, or peso, as well as for small denomination silver coins and for \$2.50, \$5.00 and \$10.00 gold coins. Thus, from the outset the United States dollar was not simply a silver coin. Rather, the dollar was the unit of account and was given physical embodiment in both gold and silver coins of various denominations. The silver dollar continued in use, but from 1873, when the United States abandoned bimetallism in favour of the gold standard, it had the status of a token coin, i.e., a coin worth more as money than as metal. In 1853 small denomination coins had become tokens.

In the U.S. monetary system "dollar" is used in several senses. By law it is the name of the unit of account. A dollar also is a legally specified weight of gold from 1934, 15.48 gr (troy), 9 fine. As such it does not circulate. Day to day money payments are made with coins, which are mere tokens, with various types of paper money and with checks drawn against bank deposits. There are roughly five times as many dollars in the form of coins, paper money and balances in people's checking accounts as there are gold dollars in the nation's monetary gold reserve. The gold standard does not require that a country's money be limited to the amount of its gold holdings or even that gold coins be used as a circulating money. However, steps must be taken to keep circulating dollars interchangeable with the quantity of gold defined as constituting a dollar. Unless implemented, defining a country's money as a fixed weight of gold has little significance.

As a unit of account the dollar provides the means by which values are expressed. It is in dollars that prices are quoted, accounts are kept, debts are contracted and calculations of incomes and costs are performed. Similarly, in other countries francs, pesos, pounds sterling, etc., are used as the unit of reckoning. In the sense of unit of account, the dollar is an abstract unit of value, but the magnitude of its value is given dimension by virtue of the existence of a limited quantity of circulating dollars.

Fundamentally the purpose of connecting the dollar to gold is to assure that the buying power of the dollar will remain reasonably constant. Great economic distress results when prices in general rise or fall rapidly, or, in other words, when the value of money decreases or increases. The effects of changing price levels are to alter the distribution of income quite inequitably and also to distort production through creating disparities between costs and returns. The basic difficulty is that all prices do not change uniformly.

In many historical episodes money not effectively linked to gold has depreciated seriously. The United States had such an experience during the Civil War period. Germany in 1923, Hun-

gary in 1945 and China in 1949 provide examples of countries impoverished through inflation. However, some nations, notably Sweden in the 1930s, demonstrated that an irredeemable paper currency may retain stability in its value. Nevertheless, there is a strong sentiment for gold-based currencies. Even if they fluctuate in value, historically they have proved more stable than most paper currencies.

Throughout U.S. history the dollar has been defined in terms of gold (and silver also prior to 1873). Moreover, except during 1861-79 and 1933-34, this definition has been meaningful. Prior to March 6, 1933, free coinage of gold together with redemption of paper money in gold coin accomplished this. Beginning Jan. 31, 1934, government purchase and sale of gold in uncoined form at a fixed price served the same purpose. The practical effect of either of these arrangements is that a dollar of circulating money is kept at the same value as the physical quantity of gold specified as constituting a dollar. Of necessity, if circulating money does not itself consist of full weight gold coins, a limit must be placed on the number of circulating dollars which may be created. Otherwise, equivalence cannot be maintained. A complex system of reserve requirements ultimately based on the nation's stock of gold bars serves to fix an upper limit to the circulating medium. Purchase and sale of gold connects circulating dollars to the gold dollar.

A relatively small number of gold dollar coins were struck, beginning in 1849, but their small size made their circulation impractical. This coin contained 25.8 gr (troy), 9 fine gold, which was the gold dollar's weight from 1837 to 1934. On Jan. 31, 1934, the gold in the dollar was reduced to 15.48 gr (troy), 9 fine. In other words, the official price of an ounce of fine gold was increased from \$30.66 to \$35.00. The action was formally taken by means of a presidential executive order issued under terms of the Gold Reserve Act of 1934. Until June 30, 1943, further reduction (as well as a slight increase) was permissible, but no further change was made. Also during 1933-34, gold coins were removed from circulation, title to all monetary gold passed to the government, coins and paper money became full legal tender and gold certificates were called in. To most people these changes were of no consequence.

Devaluation (reduction of the gold content of the dollar) was motivated by the desire to raise the price level, which had fallen by March 1933 to approximately one half its 1929 level. To the disappointment of those who advocated this step, prices generally did not rise as forecast. Not until early in World War II was the price level restored to the 1929 level, and it continued to climb. At mid century, the U.S. cost of living was roughly twice as high as in 1933.

U.S. experience demonstrated that the gold content of the dollar is not the determining factor governing the purchasing power of the dollar. From 1879 to 1933 prices repeatedly moved upward and downward through a wide range despite constancy in the gold content of the dollar. The rise in prices after 1933 was not simply the resultant of devaluation, but of a host of other factors, many of which outweighed that particular factor.

Many students of money have recommended that the linking of the dollar to gold be retained even if price level stability is not achieved simply and automatically by doing so. They hold that international monetary relationships are more stable when currencies have a gold basis and also that it is desirable to impose an upper limit through gold reserve requirements on the volume of circulating money. They believe, however, that price level stability would be achieved only by skilful central bank management within a broad framework of measures designed to promote economic stability.

Others have recommended elimination of the linking of the dollar to a fixed quantity of gold. Irving Fisher (1867-1947), the leading advocate of dollar stabilization, in 1913 proposed a compensated dollar, whose gold content would be varied inversely with the price level. Later, Fisher advocated credit control measures directed at maintaining stability in a selected index number of prices. His general proposals for dollar stabilization gained many adherents, although on matters of detail there was sub-

stantial controversy. Almost everyone agrees that stability in the dollar's buying power, if realized, would contribute greatly to economic stability.

The Employment act of 1946 did not list stability of the buying power of money as one of the objectives of national economic policy. The Federal Reserve has repeatedly stated objections to adoption of this criterion as the specific goal of monetary policy. The prevention of inflation (i.e., continued rapid rises in prices) was nonetheless the major economic problem following World War II.

Index numbers of prices are the means of measuring over-all price movements. The United States bureau of labour statistics issues two widely used indexes, one for wholesale prices and another for prices paid by consumers.

DOLLFUSS, ENGELBERT (1892-1934), Austrian statesman, born in Tetsing, Lower Austria, in 1892, was educated at the universities of Vienna and Berlin. During the world war he served as an officer in the Austrian army. In October 1918 he became president of the Austrian Federal Railways, in March 1932 minister of Agriculture and Forestry, and in May 1932 was appointed Chancellor. On March 4, 1933, fleeing the need of a strong government in face of the growing menace to Austria from German Nazis, he dispensed with further meetings of the *Nationalrat*. He was wounded in an attempt upon his life on Oct. 3, 1933, and on July 25, 1934 he was assassinated by a group of Austrian Nazis who, disguised as members of the regular Austrian army, seized the Chancellery in Vienna.

DOLLINGER, JOHANN JOSEPH IGNAZ VON (1799-1890), German theologian and church historian, was born at Bamberg, Bavaria, on Feb. 28, 1799, and was educated at the Würzburg gymnasium and at Bamberg. On April 5, 1822 he was ordained priest. In 1823 he became professor of ecclesiastical history and canon law in the lyceum at Aschaffenburg, and in 1826 professor of theology at Munich, where he spent the rest of his life. He entered into relations with the well-known French Liberal Catholic, Lamennais, whose views on the reconciliation of the Roman Catholic Church with the principles of modern society had aroused much suspicion in ultramontane circles. In 1832 Lamennais, with his friends Lacordaire and Montalembert, visited Germany, with a view to bringing about a modification of the Roman Catholic attitude to modern problems. In 1838 he published a treatise against mixed marriages, and in his works on *The Reformation* (3 vols. Regensburg, 1846-48) and on *Luther* (1851, Eng. tr., 1853) he is very severe on the Protestant leaders. In 1842 he entered into correspondence with the leaders of the Tractarian movement in England, not only with Pusey, Gladstone and Hope Scott, and two years later was made representative of his university in the second chamber of the Bavarian legislature. In 1847, in consequence of the fall from power of the Abel ministry in Bavaria, with which he had been in close relations, he was removed from his professorship at Munich, but in 1849 was invited to occupy the chair of ecclesiastical history. He was a delegate to the national German assembly at Frankfurt in 1848.

It has been said that his change of relations to the Papacy dated from the Italian war in 1859, but no sufficient reason has been given for this statement. He was unfavourably impressed by the promulgation (1854) of the dogma of the Immaculate Conception of the Blessed Virgin, and he disliked the attitude of the zealots for the restoration of the temporal sovereignty of the pope. In 1863 he invited 100 theologians to discuss at Milnes the question which Lamennais and Lacordaire had already raised in France, namely, the attitude that should be assumed by the Roman Catholic Church towards modern problems and modern science. His strong liberalism and the anti-ultramontane and anti-Jesuit attitude which he displayed at this conference led the pope to suppress it after four days session. On Dec. 8, 1864 Pius IX issued the *Syllabus* (q.v.), in the 13th thesis of which he condemned certain of Dollinger's views. It was in connection with

the problems raised at the conference that Dollinger published his *Past and Present of Catholic Theology* (1863) and his *Universitas Past and Present* (Munich, 1867).

We now approach the critical period of Dollinger's life. The headquarters of the opposition to the movement for the declaration of papal infallibility which was now mooted in many quarters was Germany, and its leader was Dollinger. Among the group were his intimate friends Johann Friedrich and J. N. Huber (q.v.), in Bavaria. In the rest of Germany he found many supporters, chiefly professors in the Catholic faculty of theology at Bonn, among whom were the famous canonist von Schulte, Franz Heinrich Reusch, the ecclesiastical historian Joseph Langen, as well as J. H. Reinkens, afterwards bishop of the Old Catholic Church in Germany, Knoodt, and other distinguished scholars, and, in Switzerland, Prof. Edward Herzog, who became Old (or, as it is sometimes called, Christ-) Catholic bishop in Switzerland. Early in 1869 the famous *Letters of Janus*, written by Dollinger in conjunction with Huber and Friedrich (which were at once translated into English, 2nd ed. *Das Popsttum*, 1891), began to appear. The *Letters* pointed out the tendency of the *Syllabus* towards obscurantism and papal despotism, and marshalled the evidence against papal infallibility, a subject which had been placed on the agenda of the Vatican Council fixed for Dec. 8, 1869. During its session the world was kept informed of what was going on in the *Letters of Quirinus*, by Dollinger and Huber, who were supplied with information by Augustin Theiner, the librarian at the Vatican, then in disgrace with the pope for his outspoken Liberalism. The dogma was carried by an overwhelming majority and the dissentient bishops, one by one submitted (see VATICAN COUNCIL). Dollinger, understanding infallibility to apply to all official exercise of the supreme magistracy, including encyclicals, headed a protest by 44 Munich professors, and convened a congress at Nuremberg, which met in Aug. 1870 and issued a declaration adverse to the Vatican decrees. The archbishop of Munich called upon Dollinger to submit. Dollinger answered (Nov. 28, 1871) that the decrees were opposed to Holy Scripture, to the traditions of the Church for the first 1,000 years, to historical evidence, to the decrees of the general councils, and to the existing relations of the Roman Catholic Church to the state in every country in the world. "As a Christian, as a theologian, as an historian, and as a citizen," he added, "I cannot accept this doctrine."

The archbishop replied (April, 1871) by excommunicating Dollinger (see VATICAN COUNCIL and INFALLIBILITY), who was thereupon almost unanimously elected rector magnificus of the university of Munich while Oxford, Edinburgh and Marburg universities conferred upon him the honorary degree of doctor of laws and Vienna that of philosophy. The Bavarian clergy invited Bishop Loos of the Jansenist Church in Holland, which for more than 150 years had existed independent of the Papacy and had adopted the name of "Old Catholic," to hold confirmations in Bavaria. The offer was accepted, and the three Dutch Old Catholic bishops declared themselves ready to consecrate a bishop, if it were desired. The momentous question was discussed at a meeting of the opponents of the Vatican decrees, when Dollinger voted against the proposition, and withdrew from any further steps towards the promotion of the movement. He declined to initiate a schism (see OLD CATHOLICS).

Dollinger's attitude to the new community was not very clearly defined. His addresses on the reunion of the Churches, delivered at the Bonn Conference of 1872, show that he was not hostile to the newly formed communion, in whose interest the conference was held, in 1874 and again in 1875, he presided over the Reunion Conferences held there and attended by leading ecclesiastics from the British Isles and from the Orthodox Church. At the latter of these two conferences, when Dollinger was seventy six years of age, he delivered a series of addresses in German and English, in which he discussed the state of theology on the continent, the reunion question, and the religious condition of the various countries of Europe in which the Roman Catholic Church held sway, and he succeeded in inducing the Orientals, Anglicans and Old Catholics present to accept a formula of concord, drawn

from the writings of the leading theologians of the Greek Church, on the question of the Procession of the Holy Spirit. During his last years of retirement he wrote, in conjunction with his friend Reusch, *Geschichte der Moraltatsgesetzen in der römisch-katholischen Kirche seit dem sechzehnten Jahrhundert mit Beiträgen zur Geschichte und Charakteristik des Jesuitenordens* (Nördlingen, 1889). Dollond died in Munich on Jan. 14, 1890, at nearly ninety-one. He declined to receive the sacraments from the parish priest at the cost of submission, but the last offices were performed by his friend Professor Friedrich.

In addition to the works referred to in the foregoing sketch, we may mention *The Eucharist in the First Three Centuries* (Mann, 1836), a *Church History* (1836, Eng. trans., 1840), *Hippolytus and Calistus* (1854, Eng. trans., 1876), *First Age of Christianity* (1860), *The Church and the Churches* (Munich, 1861), *Lectures on the Reunion of the Churches, The Vatican Decrees, Studies in European History* (tr. M. Warren, 1890), *Miscellaneous Addresses* (tr. M. Warren, 1894). See L. von Kober, *Conversations of Dr. Dollond* (tr. by K. Gould, 1892), and J. Friedrich, *Ignaz von Dollond* (Munich, 1899-1901).

DOLLOND, JOHN (1706-1761), FRS (1761), English optician, was the son of a Huguenot refugee, a silk weaver at Spitalfields, London, where he was born on June 10, 1706. He followed his father's trade, but found time to acquire a knowledge of Latin, Greek, mathematics, physics, anatomy and other subjects. In 1752 he abandoned silk-weaving and joined his eldest son, Peter Dollond (1730-1820), who in 1750 had started in business as a maker of optical instruments. His reputation grew rapidly, and in 1761 he was appointed optician to the king. In 1758 he published an "Account of some experiments concerning the different refrangibility of light" (*Phil. Trans.*, 1758), describing the experiments that led him to the discovery of a means of constructing achromatic lenses by the combination of crown and flint glasses. Following the suggestion of Leonhard Euler and the experiments of Samuel Klingensterna (1698-1765) Dollond commenced a series of tests on achromatism. Early in 1757 he succeeded in producing refraction without colour by the use of glass and water lenses, and a few months later he obtained the same result by a combination of glasses of different refrangibilities (*see TELESCOPE*). Dollond also published two papers on apparatus for measuring small angles (*Phil. Trans.*, 1753, 1754). He died in London on Nov. 30, 1761.

DOLLS The doll, the familiar toy puppet of childhood, is one of the oldest of human institutions. Common among both savage and civilized people, its antiquity is attested by Egyptian, Greek and Roman remains, among which small figures of clay, wood, bone and ivory are identified as dolls from being found in children's graves.

Dolls are among the first inventions of children, having been doubtless improvised in the earliest instances from natural objects such as sticks and stones. Aboriginal America and Japan are the chief sources of information. The child's doll occurs among the American Indians as the image of a deity, made of wood, regarded as sacred and entrusted to the child in its religious instruction. Such dolls, carved to represent the masked dancers who personate the gods, are used to dry throughout the Pueblo area of the United States in New Mexico and Arizona, and in a derived form among the Pomo in California. They are also treated with great respect by the Pueblos, their life being forbidden. The dolls of the Keres Indians of Laguna and Cochiti are not elaborately carved or dressed, being flat or rounded billets, identical in form with the prayer sticks employed as ceremonial offerings. The Navaho who occupy the adjacent territory look with superstitious fear upon the Pueblo doll and use a wooden effigy representing a Hopi doll to work evil upon an enemy. Indian mothers among the Chippewa put feathers in the form of a child in the cradle of a dead infant, carrying this about with them and treating it as though living. The Eskimo and northern Indians make children's dolls of bone, ivory and mammoth teeth, and dress them in fur and hide. Small clothed clay dolls are found in ancient Peruvian graves. The headless buckskin dolls of the Plains and other Indians appear to have been inspired by white influence.

In Japan a primitive type of child's doll consists of a shaved willow stick with shavings or strings for hair, and paper clothes, an

obvious adaptation of the shaved willow sticks formerly set up on the banks of streams as scarecrows at the annual purification ceremony. An actual scarecrow doll, which was dressed and fed and generally treated as though alive, was given to mothers in old Japan to ward off evil from their children. Women desiring children presented dolls essentially emblems of maternity, at a certain shrine. Apart from these "magical" dolls, Japanese girl children have ordinary dolls as well as ceremonial dolls symbolizing

BY COURTESY OF THE MUSEUM OF THE AMERICAN INDIAN

PRIMITIVE TYPES OF DOLLS OF THE CARAJA INDIANS BRAZIL

the imperial court, which are not played with but exhibited formally at the girls' festival on May 3. Japanese boys have similar toy images of warriors, which are displayed at their festivals on the fifth of March. In Korea little girls make their own dolls and cut a bamboo pipe stem about 5 in. long, in the top of which they put long grass, salted and made fine like hair. They never give these a face but sometimes paste a little white powder in its place. They dress the stick in clothes like those worn by women and sometimes put a pin, made by themselves, in the hair. The children's festival in Korea occurs on April 8, celebrated in Japan as the birthday of Buddha. On this occasion, the Koreans make an image of a woman of paper with a rounded base made of clay so that it stands erect. In Japan the corresponding toy is identified as the Buddhist *Daruma* and is purchased by boys at the festival of a certain temple. One which rises quickly to a vertical position is selected. The face is painted, but instead of eyes, two white paper discs are pasted. This doll is carried home placed on the "god shelf" and a prayer is said. The god is promised eyes if he answers the prayer, and this accomplished, black dots are made with ink on the vacant eye discs. In China this toy is made to represent an actor and described as a drunken man.

Among the Hindus and Mohammedans in India, where infant marriage prevails, elaborately dressed dolls with belongings are among the presents given to a girl at marriage. Their use is general throughout the Mohammedan East in spite of the laws of Islam which forbid the representation of the human figure. The nine-year-old wife of Mohammed, Aischa, brought her dolls when she entered his harem and the Prophet himself is said to have played with them. Mohammedan women in Baghdad are said to see a spirit in every doll that may bring harm to their children. Dolls, therefore, are not given to children as toys, but little girls, following their instincts, make dolls of pillows and blocks of wood. In Persia girls make their dolls of pieces of folded cotton which they clothe and mark with features. Here, too, an image of a doll is, it is said, sometimes placed in a temple at the time of its erection to secure its continued welfare.

Dolls are common in Africa, where certain forms are peculiar to certain regions and their use by children as toys is complicated by magical observances. Their general appearance is similar to the carved wooden fetiches to which they seem genetically related. Among the Fingo of the Orange Free State, a girl is given a doll when she becomes of age, which she keeps until she has a child. Then her mother gives her another doll which she keeps until she has a second child. Analogous to the scarecrow dolls of old Japan, these dolls are considered sacred and not parted with.

As regards Christian Europe there is little direct information, although dolls are known to have existed, as has been previously indicated, from Roman times.

It is known also that in earlier centuries those used as playthings were connected with images of the saints and were associated with the Christmas festival. A structure representing the scene of the Nativity was erected in churches and private houses, where the Christ child was displayed in its cradle with more or less elaborately costumed figures of the Holy Family, the Magi

and their retainers. These reached a point of great elaboration in the 17th and 18th centuries as shown in the collection in the Bavarian National museum in Munich. And this custom still survives in France, Spain, Italy and all other Catholic countries. Toy fair, are held in the streets and purely secular dolls are sold side by side with toy images representing the Holy Infant, the Virgin Mary, St. Joseph, St. Nicholas and St. Christopher and other saints associated with this season.

In Protestant Europe the doll's house seems to have replaced the crèche, the *berche* and the *nacimiento* of France, Germany and Spain and is highly developed, as may be seen in the German National museum in Nuremberg, the South Kensington museum in London and in museums of Holland and Belgium.

As regards manufacture of dolls the Netherlands and the Tyrol have long been leading centres of the industry in Europe, while it may be noted further that dolls intended to illustrate seasonal fashions constitute a branch of the industry which came into existence much earlier than might be generally supposed. During the World War elaborately costumed dolls of the latter type, made very often by women artists as a means of livelihood in the period of distress, and bought by adults for ornamental purposes, if not as playthings, were produced in large numbers and acquired great popularity as gifts and keepsakes among the well to do.

D'Aellenne, *Histoire des Jouets* (Paris, 1927), Richard Andree, *Ethnographische Parallelen* (Leipzig, 1889), J. Walter Fewkes, *Internat. Archiv f. Ethnogr.* 45 (1894), Mrs. F. Nevill Jackson, *Toys of Other Days* (London 1908) (S. C.).

DOLMAN, originally a long, loose garment left unfastened in front, and with narrow sleeves. It is worn generally by the Turks, and is not unlike a cassock in shape. The name was given to the uniform jacket, worn by Hussars, and slung from the shoulders with the sleeves hanging loose.

DOLMEN, the term used of a certain type of prehistoric monuments, which usually consists of several great stone slabs set edgewise in the earth to support a flat stone which serves as a roof. The structure was designed as a burial chamber and is typical of the Neolithic period in Europe. The word is Celtic in origin but probably is not Breton, the Welsh equivalent of the word is Cromlech. Dolmens, although found in covered form as far East as Japan, were mainly confined to Europe and Northern Africa. There are many examples in the British Isles. See BARROW and BORDAO, *The Dolmens of Ireland* (1897).

DOLMETSCH, ARNOLD (1858–1940), French musician, was born at Le Mans in 1858. He studied under Viennet in Brussels and later at the Royal College of Music in London. His keen interest in old music and obsolete instruments took the practical form of research among the manuscripts in the British Museum and other collections on the one hand and of collecting and repairing the instruments themselves on the other. To reconstruct new instruments on the lines of the old was the next step, and to this end he worked from 1902 to 1909 at the Chickering factory in Boston, U.S.A., and from 1911 to 1914 at the Gavaud factory in Paris. In 1914 he returned to London, where he became a familiar figure in the musical world by virtue of his interesting revivals of early English music and his ingenious reconstructions of harpsichords and clavichords. He maintained a workshop at Haslemere in Surrey, where he also organized annual festivals of old chamber music of the 16th, 17th and 18th centuries. On these occasions the fortnight's programmes were carried through with the help of his own instruments and those of his pupils. These concerts, which were given in the open air, were of a high level of achievement.

Among Dolmetsch's published works are *Die Clavierinstrumente der XVI. und XVII. Jahrhunderte* and *Die Clavierinstrumente der XVIII. und XIX. Jahrhunderte*.

DOLOMIEU, DODAT GU SILVAIN TANCREDE GRATIEU DE (1775–1861), French mineralogist, was born in 1775. He was admitted in his infancy a member of the Order of Malta. In his nineteenth year he quarrelled with a knight of the

galleys on which he was serving, and in the duel that ensued killed him. He was condemned to death, but in consideration of his youth was pardoned, after nine months' imprisonment. In 1775 he published his *Recherches sur la pesanteur des corps à différentes distances du centre de la terre*, and soon after threw up his commission in the carabiniers, and in 1777 accompanied the *balli* (afterwards Cardinal L. R. E.) de Rohan to Portugal. In the following years he visited Spain, Sicily, the Pyrenees and Calabria, the scientific results being given in a series of important works. In 1786 and 1790 he studied the Alps, and the mineral dolomite (named after him) was described by Dolomieu in 1791. He returned to France in that year, bringing with him rich collections of minerals. On Sept. 14, 1792, his friend, the duc de la Rochefoucauld was assassinated at Forges, and Dolomieu retired with the widow and daughter of the duke to their estate of Roche Guyon. In 1798 he accompanied Bonaparte's expedition to Egypt, but ill health compelled his return. On the way home he was captured, and imprisoned at Naples in a pestilential dungeon, where he remained 21 months. Deprived of writing materials, he made a piece of wood his pen, and with the smoke of his lamp for ink he wrote upon the margins of a Bible, the only book he still possessed, his treatise *Sur la philosophie minéralogique et sur l'espectre minéral* (1801). He died at Château-Neuf, Saône-et-Loire, on Nov. 26, 1801.

See Lacépède, "Éloge historique de Dolomieu," in *Mémoires de la classe des sciences de l'Institut* (1806), Thomson, in *Annals of Philosophy*, vol. xi p. 161 (1808).

DOLOMITE, a mineral species consisting of calcium and magnesium carbonate, $\text{CaMg}(\text{CO}_3)_2$, and occurring as rhombohedral crystals or large rock-masses. Analyses of most well-crystallized specimens correspond closely with the above formula, the two carbonates being present in equal molecular proportions (CaCO_3 54.35, MgCO_3 45.65%). Normal dolomite is thus not an isomorphous mixture of calcium and magnesium carbonates, but a double salt. In crystalline form it is very similar to calcite, belonging to the same group of rhombohedral carbonates, the primitive rhombohedron, parallel to the faces of which there are perfect cleavages, has interfacial angles of $73^\circ 45'$. A specially characteristic feature is that this rhombohedron is frequently the only form present on the crystals (in calcite it is rare except in combination with other forms), the faces are also usually curved, sometimes to an extraordinary degree, giving rise to saddle shaped crystals. In the degree of symmetry possessed by the crystals there is, however, an important difference between calcite and dolomite, the latter is hemihedral with parallel faces, having only an axis of twofold symmetry and a centre of symmetry.

Dolomite is both harder ($H=3.5-4$) and denser ($\rho=2.85$) than calcite. The two minerals may also be readily distinguished by the fact that dolomite is not acted upon by cold, dilute acids. Crystals of dolomite vary from transparent to translucent, and often exhibit a pearly lustre, especially when the faces are curved, the colour is usually white or yellowish.

The crystallized mineral was first examined chemically by P. Woulfe in 1779, and was named compound spar by R. Kirwan in 1784, other early names are bitter-spar, rhomb-spar and pearl-spar (but these included other rhombohedral carbonates). The name dolomite (*dolomite* of N. T. de Saussure, 1792) is in honour of the French geologist, D. G. Dolomieu, this name was originally applied to the rock only, but was later extended to the crystallized mineral, first in the form dolomite spar.

In the white crystalline dolomite-rock of the Binnental near Breg in Switzerland beautiful water clear crystals of dolomite are found, and crystallized masses occur embedded in serpentine, talc-schist and other magnesium silicate rocks. The best crystallized specimens are, however, usually found in metalliferous deposits, for example, in the iron mines of Traversella near Ivrea, Piedmont (as large twinned rhombohedra) and Cleator Moor, Cumberland, in the deposits of lead and zinc ores at Alston, Cumberland, Lavey in the Isle of Man and Joplin in Missouri.

DOLOMITES, THE, a mountain district in the South Tyrolean Alps, and a subdivision of the Alps. The mountains are

between it and later records a gulf that is hard to bridge.

But in the *Dialogus de scaccario* (temp. Hen. II) it is spoken of as a record from the arbitrament of which there was no appeal (from which its popular name of "Domesday" is said to be derived). In the middle ages its evidence was frequently invoked in the law courts, and even now there are certain cases in which appeal is made to its testimony. To the topographer, as to the genealogist, its evidence is of primary importance, for it not only contains the earliest survey of a township or manor but affords in most cases the clue to its subsequent descent. The rearrangement on a feudal basis, of the original returns (as described above) enabled the Conqueror and his officers to see with ease the extent of a baron's possessions, but it also showed how far he had enfeoffed "under tenants," and who those under tenants were. This was of great importance to William, not only for military reasons, but also because of his resolve to make the under tenants (though the "men" of their lords) swear allegiance directly to himself. As Domesday normally records only the Christian name of an under tenant, it is vain to seek for the surnames of families claiming a Norman origin, but much has been done to identify the under tenants, the great bulk of whom bear foreign names.

Domesday Book was originally preserved in the royal treasury at Winchester (the Norman kings' capital), whence it speaks of itself (in one later addition) as *Liber de Wintonia*. When the treasury was removed to Westminster (probably under Henry II) the book went with it. There it remained until the days of Queen Victoria, being preserved from 1696 onward in the chapter house and removed only in special circumstances, as when it was sent to Southampton for photozincographic reproduction. It was eventually placed in the public record office, London, where it can be seen in a glass case in the museum. In 1869 it received a modern binding. The ancient Domesday chest, in which it used to be kept, is also preserved in the building.

The printing of Domesday, in "record type," was begun by the government in 1773, and the book was published in two volumes folio in 1783, in 1811 a volume of indexes was added, and in 1816 a supplementary volume, separately indexed, containing (1) the Exon Domesday (for the southwestern counties), (2) the *Inquisitio Eliensis*, (3) the *Liber Winton* (surveys of Winchester early in the 12th century) and (4) the Bolden Book, a survey of the bishopric of Durham a century later than Domesday. Photographic facsimiles of Domesday Book, for each county separately, were published in 1861-63, also by the government.

BIBLIOGRAPHY.—The following are the more important works to be consulted: R. Kellham, *Domesday Book*, illustrated (1788); H. Ellis, *General Introduction to Domesday Book* (1833), containing valuable indexes to the names of persons; N. E. S. A. Hamilton, *Inquisitio Cantabrigie* (1876), containing transcripts of the original returns and the text of the *Inquisitio Eliensis*; E. A. Freeman, *History of the Norman Conquest*, vol. iv and v, F. Seebohm, *The English Village Community* (1883), *Domesday Studies* (1888, 1891), on the occasion of the Domesday commemoration (1886), by various writers with bibliography to date; J. H. Round, *Feudal England* (1895); F. W. Matland, *Domesday Book and Beyond* (1897); P. Vinogradoff, *Villainage in England* (1893), *Growth of the Manor and English Society in the Eleventh Century*, A. Ballard, *The Domesday Inquest* (1906), an excellent summary; W. H. Stevenson, "A Contemporary Description of the Domesday Survey," *English Historical Review* (the general index to which should be consulted) (1907). The *Victoria County History* contains a translation of the Domesday text, a map and an explanatory introduction for most counties. For the Cheshire and Lincolnshire surveys see the editions published respectively by the Chetham Record Society (1916) and the Lincoln Record Society (1924). (J. H. R.)

DOMESTIC SERVICE. The extent of employment in household service in different countries depends first upon economic and second upon social structure.

In underdeveloped economies, exceptionally low wages and the absence of alternative employment enable those who have incomes only slightly above the average to employ servants rather than to spend their incomes on consumption or investment. The really wealthy maintain large households of servants, which sometimes count as an index of economic status. As average income per head in a community rises there is a greater demand on the part of the richer members of society for domestic servants, but this tendency is more than offset in countries such as the United States and Australia by the relatively high wages earned by women in industry. Only in countries where income distribution is markedly uneven is there a high proportion (10% or more) of domestic servants. In rich countries with little inequality of income there is a tendency to substitute labour-saving devices in the home for domestic servants, and much of the work formerly required in private households is thus eliminated.

Social structure influences the attitudes toward domestic service in the community. In mediaeval feudal communities men of gentle birth were frequently found among the upper servants of the nobility, and even menial tasks were not considered degrading when they were carried out for the wellborn: a servant might catch the reflected glory of his master. The growth of commerce and industry, the development of a money economy and increased social mobility changed the pattern of social relationships, but it was not until the great economic changes of the 19th century in Europe that a sense of inferiority both toward the employer and toward the outside world became widespread and important among domestic servants. In the 20th century, particularly in periods of full employment, domestic service tended to be regarded as a second-best occupation, to be adopted only under economic pressure when more attractive openings were not available. As private domestic servants declined in numbers there was a growth in the number and size of commercial establishments catering for personal needs, as a result, the personal service sector of the economy continued to grow in highly developed countries.

Domestic service includes many different types and grades of occupation, from the butler (*q u*) in charge of a large household to charwomen employed casually. The history of the different groups has not been written for any country, and it is difficult to generalize about conditions of service. The position of servants has always depended more on human relations than on organization or legal obligations. Six factors influence the position of the domestic servant: (1) the nature of the work to be done, (2) the personality and status of the employer, (3) the size of the household or establishment, (4) the pattern of authority, (5) the payment and conditions of service, and (6) the interference of the law.

The nature of the work to be done varies from highly skilled to completely unskilled jobs. The personality of the employer defies generalization, in the literature of all countries there are stories of employers who have been far more dependent on their servants than their servants have been dependent on them. Status varies from the housewife-employer to the potentate and the size of household varies accordingly. The pattern of authority may be paternalistic, severely hierarchical—as it was in the 18th century—or informal. The whipping of servants was permissible in England until the 17th century and survived longer in eastern Europe and still longer in parts of Asia. In the advanced countries of the 20th century coining and cajolery became common.

Payment and conditions have varied from town to country and from subsistence to money economies. Houses were planned with little attention to servants' quarters, and perquisites varied not only from place to place but from time to time. There was a general upward trend of servants' wages in most countries from the 17th century onward.

The amount of legislation relating to servants is relatively small in all countries. Custom has been more important than legal enactment, and the scattered nature of domestic service has made it difficult for servants to form clubs or combinations to protect their common interest. The inequality between servant and master was less marked in continental Europe than in England in the 19th century.

The shortage of domestic servants in Great Britain and in the United States led to some migration of domestic labour. After World War II a limited number of foreign immigrants was permitted in Great Britain by the Ministry of Labour. In addition the National Institute of Houseworkers was set up in London in 1946 with the object of raising the status of domestic service to that of a skilled trade, successful students are entitled to a diploma, and employers appointing them to posts must agree to offer certain minimum wages and conditions of work. In the United States many universities organized courses on home economics. By the 1950s the position of the domestic servant had already changed much since the end of the 19th century. (A. B. R.)

United States.—In colonial times servants were chiefly Indian and Negro slaves and transported white convicts and redemptioners. Girls were frequently apprenticed to domestic service until of age or married, and women probably hired out as help before they engaged in any handicraft for pay. The number of women in manufacturing increased rapidly, however, and later many entered clerical and professional pursuits. But in 1870 more than half the gainfully employed females were in domestic service, and even in 1920 this remained one of the principal fields of employment for women.

The relative importance of domestic service as a field of employment for women declined steadily for many years. The trend toward employment in other industries which began during World War I was temporarily reversed during the 1920s and 1930s, but increased greatly during World War II. Regardless of colour or race, women abandoned domestic service to seek employment in stores, factories and offices. The inducements were probably regular and shorter hours in other employments, greater standardization, more congenial companionship and pleasanter surroundings, and also a better social status. Other causes were the high wages and the great demand for women workers outside the home during wartime, practical cessation of immigration between 1915 and 1920, which greatly reduced the number of foreign born women available as servants, increased wages for servants, making them luxuries which only the well-to-do could afford, simplified house-keeping, resulting from the fact that much work formerly done in the home came to be done outside, from increased use of various household appliances and from the increase in apartment homes and the custom of taking meals in *cafés* and restaurants. Servants proved less necessary than formerly, and people did without them. By mid 20th century the occupation of domestic employment had declined from first place to fifth as a field for women, according to the U.S. department of labour's bureau. It was estimated that women comprised nine tenths or more of the U.S. domestic workers. In 1950 the number of domestic workers totalled 1,923,000, a decline of 14% compared with the total of 2,240,000 in 1940. In April 1952 domestic workers of whom only 2% were men, numbered 1,786,000. (A. M. E., X.)

DOMETT, ALFRED (1811–1887), British colonial statesman and poet, was born at Camberwell Grove, Surrey, on May 20, 1811. He became the intimate friend of Robert Browning, of whose poem "Warning" he was the subject. An interesting account of the friendship between the two men appeared in *The Contemporary Review* for Jan. 1905, by W. H. Griffin. (See also *Robert Browning and Alfred Domett*, ed. by T. G. Kenyon, 1906.) In 1842 Domett emigrated to New Zealand, where he filled many important administrative posts, being colonial secretary for New Munster in 1848, secretary for the colony in 1851 and prime minister in 1862. He returned to England in 1871, was created C.M.G. in 1880 and died on Nov. 2, 1887. Among his volumes of verse, *Ranolf and Amohia*, a *South Sea Day Dream*, is the best known (1872), and *Flotsam and Jetsam* (1877) is dedicated to Browning.

DOMETTE A term applied to a loosely woven fabric of light texture of the plain calico weave and finished with a nap on both sides similar to flannellette (*q.v.*). It is sometimes woven either

plain or striped as in all cotton fabric, and sometimes with a cotton warp and woollen weft, and employed for various purposes as, for example, a light wadding for use by dressmakers, waistbands for hosiery pants, pajamas, shirts and shrouds. One quality of domette contains 36 warp threads per inch, of 32's cotton, and 22 picks per inch, of 10's woollen weft.

DOMFRONT, a town of northwestern France in the *arrondissement* of Alençon, in the *département* of Orne, 43 mi. W.N.W. of Alençon by rail. Pop. (1946) 2,912. The town sits on a bluff overlooking the Varenne, has a church, *Notre-Dame-sur-l'Eau*, dating from the 11th century. Domfront is said to have grown up in the 6th century round the oratory of the hermit St. Front, and played an important part in the wars against the English and the religious wars. In 1574 it was occupied by the Protestant leader Gabriel de Montgomery, who after a stubborn siege was forced to yield it to Jacques Goyon, count of Matignon. In the middle ages it was one of the chief strongholds in Normandy, and there still remain several towers of its ramparts, and runs of the keep of its castle built in 1011, rebuilt in the 12th century by Henry II, king of England, and dismantled at the end of the 16th century. The town is the seat of a subprefect and has a tribunal of first instance. There are quarries in the vicinity.

DOMICILE, or **DOMICIL**, a residence, in law, the place where a person has his or her principal residence. In French law it is only a step to naturalization. In English law it implies something more than mere residence. A person has either a domicile of origin or a domicile of choice. The former is the place of his parents' home and the latter is the place where he intends to reside. In the United States it is the place where a person exercises his political rights.

Since the beginning of the 19th century most of the leading European states have unified their internal laws, and attachment to a province by domicile having thus become an unnecessary consideration they have adopted political nationality as the criterion of the law to be applied in most of the questions which used to depend on domicile. Thus as between themselves they have greatly simplified the determination of those questions, but a similar elimination of domicile is impossible in what concerns British subjects, because the British empire continues to include a great variety of laws, as those of England, Scotland, the province of Quebec, etc. Within the British dominions domicile is the available criterion of the legal character of a British subject, all British courts continue to apply the same criterion to British subjects outside those dominions and to foreigners.

The Roman jurists defined domicile to be the place "*ubi iurem rramque ac fortunam suam constituit, unde iure non sit discedurus si nihil obstat, unde cum profectus est, peregrinari videtur, quo si rediit peregrinari iam destitit*". This makes that place the domicile which may be described as the headquarters of the person concerned, but a man's habits of life may point to no place, or may point equally to two places, as his headquarters, and the connection of domicile with law requires that a man shall always have a domicile, and never more than one. The former of these difficulties is met in the manner described by Lord Westbury in *Udhoy v. Udhoy* (L.R., 1 H.L. 364). "It is," he said, "a settled principle that no man shall be without a domicile, and to secure this end the law attributes to every individual as soon as he is born the domicile of his father, if the child be legitimate, and the domicile of his mother, if the child be illegitimate. This is called the domicile of origin, and is involuntary. It is the creation of the law, not of the party. It may be extinguished by act of law, as for example by sentence of death or exile for life, which destroys the *status civilis* of the criminal, but it cannot be destroyed by the will and act of the party. Domicile of choice is the creation of the party. When a domicile of choice is acquired, the domicile of origin is in abeyance, but is not absolutely extinguished or obliterated. When a domicile of choice is abandoned, the domicile of origin revives, a special intention to revert to it not being necessary. A natural born Englishman may domicile himself in Holland, but if he break up his establishment there and quits Holland, declaring that he will never return, it is absurd to suppose that

his Dutch domicil clings to him until he has set up his tabernacle elsewhere." If to this we add that legitimate minors follow the changes of the father's domicil and a married woman follows the domicil of her husband, also that compulsory detention will not create a domicil, the outlines of involuntary domicil will have been sufficiently sketched.

For the establishment of a domicil of choice there must be both *animus* and *factum*, intention and fact. The fact need not be more than arrival in the territory of the new domicil if there be the necessary intention, while any number of years' continuance there will not found a domicil if the necessary intention is absent. As the result of the most recent English and Scottish cases it may be laid down that the necessary intention is incompatible with the contemplation by the person in question of any event on the occurrence of which his residence in the territory in question would cease, and that if he has not formed a fixed and settled purpose of settling in that territory, at least his conduct and declarations must lead to the belief that he would have declared such a purpose if the necessity of making an election between that territory and his former one had arisen. The word territory, meaning a country having a certain legal system, is used advisedly, for neither the intention nor the fact need refer to a locality. It is possible that a Scotsman or a foreigner may have cleverly established a domicil of choice in England, although it may be impossible to say whether London, Brighton or a house in the country is his true or principal residence. What is here laid down has been gradually attained. In the older English cases an intention to return to the former domicil was not excluded, if the event on which the return depended was highly uncertain and regarded by the person in question as remote. Afterwards a tendency towards the opposite extreme was manifested by requiring for a domicil of choice the intention to associate oneself with the ideas and habits of the new territory—*Quatenus in illo exare patriam*, not in the political sense, which it was never attempted to connect with change of domicil, but in the social and legal sense. At present it is agreed that the only intention to be considered is that of residence, but that, if the intention to reside in the territory be proved to amount to what has been above stated, a domicil will be acquired from which the legal consequences will follow, even defeating intentions about them so clearly expressed as, for instance, by making a will which by reason of the change of domicil is invalid. The two most important cases are *Douglas v. Douglas* (1871), *L.R.*, 12 Eq. 617, before Vice-Chancellor Wickens, and *Went v. Att. Gen.* (1904), *A.C.* 287, before the House of Lords.

When the circumstances of a person's life point to two territories as domicils, the selection of the one which alone can fill that character often leads to appeals even up to the highest court. The residence of a man's wife and family as contrasted with his place of business, his exercise of political or municipal functions, and any conduct which tends to connect his children with a given country, as by their education, or the start given them in life, as well as other indications, are often cited as important, but none of them is in itself decisive. The situation must be considered as a whole. When the question is between the domicil of origin and an alleged one of choice, its solution is rendered a little easier than it is when the question is between two alleged domicils of choice, the burden of proof lying on the party which contends that the domicil of origin has been abandoned.

In the state of the law which has been described it will not be found surprising that an act of parliament, 24 and 25 Vict. c. 121, recites that by the operation of the law of domicil the expectation and belief of British subjects dying abroad with regard to the distribution of their property are often defeated, and enacts that when a convention to that effect has been made with any foreign country, no British subject dying in such country shall be deemed to have acquired a domicil therein, unless he has been resident in such country for one year previous to death and has made a declaration in writing of his intention to become domiciled, and that British subjects so dying without having so resided and made such declaration shall be deemed for all purposes of testate or intestate succession as to movables to retain the domicil they possessed at the time of going to reside in such

foreign country. Similar exemptions are conferred on the subjects of the foreign State dying in Great Britain or Ireland. But the act does not apply to foreigners who have obtained letters of naturalization in any part of the British dominions. It has not been availed of, and is indeed an anachronism, ignoring as it does the fact that domicil has no longer a world wide importance, owing to the substitution for it of political nationality as a test of private law in so many important countries. The United States of America is not one of those countries, but there the importance of domicil suffers from the habit of referring questions of capacity to the law of the place of contract instead of to any personal law. (J. W.)

DOMINANT, in music, the fifth degree of the diatonic scale, e.g., G in the key of C, A in that of D, and so on, so called from its exceptional influence and importance in relation to the tonic, or key note, and the harmony in general.

Dominant was used by Mendel to describe a biological character which manifests itself, as opposed to a recessive character, which remains latent (see MENDELISM).

DOMINIC, SAINT (1170-1221), founder of the Dominican Order of Preaching Friars, was born in 1170 at Calaroga in Old Castile. He spent ten or twelve years in study, chiefly theological, at Palencia, and then, about 1195, he was ordained and became a canon in the cathedral chapter of Osma, his native diocese. The bishop induced his canons to follow the Rule of St. Augustine and thus make themselves Augustinian Canons (*q.v.*), and so Dominic became a canon regular and soon the prior or provost of the cathedral community. The years from 1195 to 1203 have been filled up with fabulous stories of missions to the Moors, but Dominic stayed at Osma, preaching much in the cathedral, until 1203, when he accompanied the bishop on an embassy in behalf of the king of Castile to "The Marches." This has commonly been taken as Denmark, but more probably it was the French or Italian Marches. When the embassy was over, the bishop and Dominic repaired to Rome, and Innocent III. charged them to preach among the Albigensian heretics in Languedoc, upon which work Dominic was engaged for ten years (1205-15).

The Albigenses (*q.v.*) have received much sympathy, as being a kind of pre-Reformation Protestants, but it is now recognized that their tenets were an extreme form of Manichaeism. They believed in the existence of two gods, a good (whose son was Christ) and an evil (whose son was Satan), matter is the creation of the evil principle, and therefore essentially evil, and the greatest of all sins is sexual intercourse, even in marriage, sinful also is the possession of material goods, the eating of flesh and many other things. So great was the abhorrence of matter that some even thought it an act of religion to commit suicide by voluntary starvation, or to starve children to death (see article "Neumanichaer" by Otto Zöckler in ed. 3 of Herzog's *Realencyklopädie für protestantische Theologie* [1903], or c. 311 of Paul Sabatier's *Life of St. Francis*). Such tenets were destructive not only of Catholicism but of Christianity of any kind and of civil society itself, and for this reason so unecclesiastical a person as the emperor Frederick II. tried to suppress the kindred sects in Italy. In 1208, after the murder of a papal legate, Innocent III. called on the Christian princes to suppress the Albigensian heresy by force of arms, and for seven years southern France was devastated by one of the most bloodthirsty wars in history, the Albigenses being slaughtered by thousands and their property confiscated wholesale.

In the opinion of Grutzmacher, one of the most recent Protestant writers on him, St. Dominic, though keeping on good terms with Simon de Montfort, the leader, and praying for the success of the crusaders' arms during the battle of Muret, "took no part in the crusade, but endeavoured to carry on his spiritual activity on the same lines as before. The oldest trustworthy sources know nothing of his having exercised the office of Inquisitor during the Albigensian war." This verdict of a fair-minded and highly competent Protestant church historian on the most controverted point of Dominic's career is of great value. His method was to travel over the country on foot and barefooted, in extreme poverty, simplicity and austerity, preaching and instructing in high-

vays and villages and towns, and in the castles of the nobility, overturning and discussing with the heretics. He used often to organize formal disputations with Albigensian leaders, lasting a number of days. Many times plots were laid against his life. Though in his ten years of preaching a large number of converts were made, it has to be said that the results were not such as had been hoped for, and after it all, and after the crusade, the population still remained at heart Albigensian. A sense of failure appears in Dominic's last sermon in Languedoc: "For many years I have exhorted you in vain with gentleness, preaching, prying and weeping. But according to the proverb of my country 'where blessing can accomplish nothing blows my avail.' We shall rouse against you princes and prelates, who, alas, will arm nations and kingdoms against this land, and thus blows will avail where blessings and gentleness have been powerless." The threat that seems to be conveyed in these words, of trying to promote a new crusade, was never carried out, the remaining years of Dominic's life were wholly given up to the founding of his order.

The Order of Dominicans grew out of the little band of volunteers that had joined Dominic in his mission among the Albigenses. He had become possessed with the idea of addressing wider circles and of forming an order whose vocation should be to preach and massenize throughout the whole world. By 1214 the nucleus of such an institute was formed round Dominic and was known as the "Holy Preaching." In 1215 the bishop of Toulouse, Dominic's great friend, established them in a church and house of the city and Dominic went to Rome to obtain the permission of Innocent III to found his order of preachers (see DOMINICANS). By two bulls of Dec. 22, 1216, Honorius III solemnly confirmed the Dominican order. Dominic spent the last years of his life journeying backwards and forwards between Toulouse and Rome, where his abode was at the basilica of Santa Sabina on the Aventine, given to him by the pope, and then in extended journeys all over Italy, and to Paris and into Spain, establishing friaries and organizing the order wherever he went. It propagated and spread with extraordinary rapidity, so that by Dominic's death in 1221, only five or six years after the first practical steps towards the execution of the idea, there were over 500 friars and 60 friaries, divided into 8 provinces embracing the whole of western Europe. Thus Dominic was at his death able to contemplate his great creation solidly established, and well launched on its career to preach to the whole world.

It appears that at the end of his life Dominic had the idea of going himself to preach to the heathen Kuman Tatars on the Dnieper and the Volga. But this was not to be, he was worn out by the incessant toils and fatigues and austerities of his laborious life, and he died at his monastery at Bologna, on Aug. 6, 1221. He was canonized in 1254 by Gregory IX, who, as Cardinal Ugolino, had been the great friend and supporter both of Dominic and of Francis of Assisi.

As St. Dominic's character and work do not receive the same general recognition as do St. Francis of Assisi's, it will be worth while to quote from the appreciation by Prof. Grutzmacher of Heidelberg:—"It is certain that Dominic was a noble personality of genuine and true piety. Only by the preaching of pure doctrine would he overcome heretics. He was by nature soft-hearted, so that he often shed tears through warm sympathy. In the purity of his intention and the earnestness with which he strove to carry out his ideal, he was not inferior to Francis."

The chief sources for St. Dominic's life are the account by Jordan of Saxony, his successor as master general of the order, and the evidence of the witnesses at the Process of Canonization, all in the Hollandists' *Acta Sanctorum*, Aug. 4. Modern biographies: Jean Guiraud, in the series *Les Saints* (Eng. trans. by Katharine de Mattos, 1901); B. Jarrett, O.P., *The Life of St. Dominic* (1924); H. P. Lott, O.P., *Vi. de S. Dominique* (1925); H. C. Sheeben, *Der Heilige Dominikus* (1927); P. Mandoulet, O.P., *Saint Dominique, Pape, l'homme et l'oeuvre* (1937), 2 vols. (Eng. trans. 1934). The two latter works contain further bibliography. See also the article "Dominicus" in ed. of Weter and Wille, *Kirchenlexikon*, and Grutzmacher's article, "Dominikus" in ed. of Herzog, *Realencyklopädie zur Protestantischen Theologie*. (L.C.B.X.)

DOMINICA, an island of the British West Indies, governed

as a colony of the Windward Islands group. It lies in 15° 30' N and 61° 20' W, between the French islands of Martinique and Guadeloupe, at a distance of about 25 mi. from each, is 29 mi. long, has a maximum breadth of 16 mi. and an area of 304 sq. mi.

A range of lofty forest clad mountains traverses the island from north to south, broken in the centre by a narrow plain drained by the rivers Layou and Pagoua, flowing west and east respectively. The highest point is Morne Diablotin (5,314 ft.), in the north. Signs of volcanic activity include solfataras, subterranean vapours and hot springs, while in the south the so-called Boiling Lake lies on the mountain side, 2,300 ft. above the sea, its banks are steep and its depth unknown. Its waters are often forced 3 ft. above the normal level by the pressure of the escaping gases, and the fumes are occasionally poisonous. The island is of extraordinary beauty and botanically remarkable for its great number of peculiar species. The hills produce valuable timber, while coffee, limes, oranges, and rubber trees, spices and many tropical fruits grow luxuriantly in the rich lowlands. There are some thirty streams of considerable size, besides numerous mountain torrents. The fisheries are productive, and honey and wax are furnished by wild bees, originally introduced from Europe. The temperature varies from 78° to 86° F. in the hot season from August to October, and from 72° to 84° in the cooler months, the rainfall varies in different parts from 50 to 160 in. per annum, but the porous soil soon absorbs the rain, and keeps the atmosphere clear and invigorating.

The manufactures include sugar, lime juice and essential oils, the exports are cocoa, coconuts, limes and lime products, oranges and bananas. The inhabitants in 1941 numbered 53,203. The majority are Negroes, the whites are of French and British descent. There are also a few Caribs, the remnant of the aboriginal population. A French *patois* is the language of the peasantry, but English is generally understood. The capital, Roseau (9,000), is a fortified town and a port, Portsmouth, the only other town, possesses the better harbour in Prince Rupert's Bay on the north-west. In religion Roman Catholics predominate, and a bishop resides at Roseau, but there is no established church. Education is free and compulsory.

History—Dominica was thus named by Columbus in 1493, in commemoration of the date, Sunday (*Dies Dominica*) Nov. 3. The first European settlers (1632) were French. In 1660 a treaty appears to have been made between the French, British and the natives, assigning St. Vincent and Dominica to the Caribs, and in 1748 it was once more agreed that Dominica should be left in the undisturbed possession of the natives. Nevertheless the French settlers increased, and the island came under the rule of a French governor. It was captured by the British and recaptured by the French frequently in the wars from 1761 onwards, and in 1805 the French general, La Grange, at the head of 4,000 troops, took Roseau and pillaged the island. The French were, however, unable to make good their hold, and Dominica has since remained undisturbed in British possession.

At first administered as part of the Leeward Islands colony, in 1771 Dominica was made a separate colony. It was rejoin administratively to the Leeward Islands in 1832, and it retained this status until 1940, when it was transferred to the Windward Islands group, once again as a separate colony. The constitution introduced in 1936 provided for an unofficial elected majority in the legislative council.

DOMINICAL LETTERS or **SUNDAY LETTERS**, letters employed in the construction of the calendar to mark the Sundays throughout the year. The first seven letters of the alphabet are taken to mark the first seven days of the year, the following sets of seven following on according to this marking. As the year consists of 52 weeks and one day the dominical letters go backward one day every year, the same order of letters recurring every 28 years, making the solar circle. See also CALENDAR.

DOMINICAN REPUBLIC see SANTO DOMINGO

DOMINICANS, otherwise called Friars Preachers, and in England Black Friars, from the black mantle worn over a white habit an order of friars founded by St. Dominic (q.v.). Their first house was in Toulouse, where the bishop established them at the church of St. Román, 1215. Dominic at once went to Rome

to obtain permission to found an order of preachers whose sphere of activity should be the whole world but Innocent III said they must adopt one of the existing rules. Dominic returned to Toulouse and it was resolved to take the Rule of St Augustine. Dominic himself having been an Augustinian canon at Osma (*see* AUGUSTINIAN CANONS). Dominic went again to Rome, and in 1216 obtained from Honorius III two bulls of confirmation which transformed the diocesan congregation of Toulouse into a religious

After an altar piece by Traini in Santa Caterina at Pisa. Holding a bible in his hand and four of his own works on his knee St. Thomas is the recipient of rays of wisdom from Christ (above), four apostles, Moses and St. Paul. Aristotle (at his right) and Plato (at his left). At his feet, between groups of faithful, lies the prostrate Averroës, with a ray of refutation piercing his Commentary.

order with a universal mission to preach. Early in 1218 an encyclical bull was issued to the bishops of the whole Catholic world recommending to them the "Order of Friars Preachers," followed in 1221 by another ordering them to give to the friars faculties to preach and hear confessions in their dioceses. By this date the friars had penetrated into some parts of Italy, France, Spain, Poland and Bohemia, and some were on their way to England.

The order took definite shape at the two general chapters held at Bologna in 1220 and 1221. The manner of life was very austere—midnight office, perpetual abstinence from meat, frequent disciplines, prolonged fasts and silence. At St. Dominic's suggestion and under his strong pressure, however, without consideration of position, the general chapter determined that the poverty prescribed in the order should be so strictly individual as not to involve the monastic orders but corporate in making the friars, so that the order should have no possessions, except the houses of buildings and churches, no property, no fixed income but should live on charity and by begging. This doubtless in violation of the Franciscan rule. The Dominicans became a mendicant order.

The extraordinarily rapid propagation of the institute suffered no diminution through the founder's death in 1221, for his four immediate successors in the general rule were men of conspicuous ability and high character. In a few years the Dominicans penetrated into Denmark, Sweden, Russia, Prussia and Poland, preaching and missionizing in the still pagan districts of these countries, and soon they made their way to Greece and Palestine and thence to central Asia. From the 14th century until the middle of the 17th the Dominicans had numerous missions in Persia, India and China, and in the northern parts of Africa. They followed the Spanish and Portuguese explorers and conquerors to both East and West, converting, protecting and civilizing the aborigines. Many suffered martyrdom.

Another conspicuous field of work of the Dominicans lay in the universities. It had been St. Dominic's policy to aim at founding houses first of all in the great university towns—at Paris, Bologna, Palencia, Oxford. This policy was adhered to, and the Dominicans soon became a power in the universities, occupying chairs in those just named and in Padua, Cologne, Vienna, Prague and Salamanca. The scholastic doctors Albert the Great and Thomas Aquinas were the leaders in this side of Dominican activity, and the order's influence on the course of medieval theological development was exercised mainly by these doctors and by the Dominican school of theology, which to this day has maintained the principles and methods elaborated by St. Thomas.

The Dominican name is in a special way associated with the foundation and propagation of the rosary. Through the centuries many Dominicans served the church as inquisitors. The vicissitudes of the order have been much like those of other orders—periods of relaxation being followed by periods of revival and reform, but there were not any reforms of the same historical importance as in most other orders, the policy having been to keep all such movements strictly within the organization of the order. In 1425 Martin V relaxed for some houses the law of corporate poverty, allowing them to hold property, and to have fixed sources of income, and 50 years later Sixtus IV extended this mitigation to the entire order, which thereby ceased to be mendicant. This change caused no troubles, as among the Franciscans, for it was felt that it did not touch the fundamental Dominican ideal.

The Friars Preachers came to England and were established at Oxford in 1227, and by the end of the century 50 friaries were in existence in England, usually in the towns, and several in Ireland and Scotland. In London they were first on the site of Lincoln's Inn, but in 1275 migrated to that now occupied by Pumping House Square, their name, "Blackfriars," surviving as that of the adjacent district. The only nunnery was at Dartford. In Mary's reign some of the scattered friars were brought together and established in Smithfield, and the remnant of the nuns were restored to Dartford. In 1550 these houses were suppressed and the nuns and friars expropriated, and for a hundred years there was no English Dominican community. In 1668 Friar Thomas Howard (afterwards Cardinal) succeeded in establishing at Bornem near Antwerp a house for the English friars. From that time there has always been an organized body of English Dominicans, again and again reduced almost to extinction but ever surviving, it now has half a dozen thriving friaries. The Irish province also survived the days of persecution and possesses a dozen friaries. In 1840 Lacordaire restored the French province. Missionary work still holds a prominent place in Dominican life, there are missions in Annam, Tongking and China, and in Mesopotamia, Mosul and Kurdistan. They have also a remarkable school for Biblical studies and research at Jerusalem, and the theological faculty in the Roman Catholic university at Fribourg in Switzerland is in their hands. There have been four Dominican popes: Innocent V (d. 1216), Benedict XI (d. 1304), Pius V (d. 1572), Benedict XIII (d. 1730).

The friars form the "first order," the nuns, or Dominicans, the "second order." Their rule resembled that of the friars, except that the nuns were strictly enclosed and purely contemplative. The "third order" is divided into two branches: the sisters of the conventual third order and secular tertiary. The sisters live a community life under the three vows and are

devoted chiefly to educational, hospital and missionary work. They are not cloistered and take only simple vows. Secular tertiaryaries are lay people of both sexes who, while living a normal life in the world, are pledged to aim at Christian perfection by the observance of rules and practices which are in accordance with the spirit of the Dominican order.

DOMINIONS OFFICE see GOVERNMENT DEPARTMENTS

DOMINIS, MARCO ANTONIO DE (1566–1624), Italian theologian, was born on the island of Arbe, off the Dalmatian coast. He was educated by the Jesuits, and became professor of mathematics at Padua, and professor of rhetoric and philosophy at Brescia. In 1596 he was appointed to the bishopric of Segna (Zengg) in Dalmatia, and in 1600 was raised to the archbishopric of Spalato and primacy of Dalmatia and Croatia. His attempts at reform brought him into conflict with his suffragans, and he also became involved in the quarrel between the papacy and Venice. He resigned his see in Sept. 1616, and wrote at Venice his *Consilium protectionis*, criticizing the papacy. In the same year he crossed to England, and being regarded as a convert to Anglicanism, was appointed master of the Savoy (1618) and dean of Windsor (1619), he subsequently presented himself to the living of West Ilsley, Berkshire. His published attacks on the papacy include the *Papatus Romanus*, issued anonymously (London, 1617, Frankfurt, 1618), the *Scroli del naufragio Cristiano* (London [?] 1618), and a *Sermon preached in Italian*, etc. before the king. But his principal work was the *Da republica ecclesiastica*, of which the first part—after revision by Anglican theologians—was published under royal patronage in London (1617), in which he ably set forth his theory of the church. In 1619 Dominis published without the author's consent Paolo Sarpi's *Historia del Concilio Tridentino*, the ms. of which he had brought with him from Venice.

Three years later the ex-archbishop was back again in Rome, doing penance for his heresy. He may have been enticed back by the elevation of his kinsman Alessandro Ludovisi, to the papal throne as Gregory XV (1621), but if so, he had barely time to publish at Rome (1621) his *Sui reditus ex Angliam consilium*, a repudiation of his antipapal work when Gregory died (July 1623). The proceedings of the Inquisition against the archbishop were revived, but before they were concluded, Dominis died in prison, on Sept. 8, 1624. Judgment was pronounced over his corpse, which was publicly burnt in the Campo di Fiore. By a strange irony of fate the publication of his *Reditus consilium* was subsequently forbidden in Venice because of its uncompromising advocacy of the supremacy of the pope over the temporal powers.

See Herzog Hauck, *Realencyklopädie*, where a full bibliography is given; G. Goodman, *The Court of James I*, ed. Brewer (London, 1839), H. Newland, *Life and Contemporaneous Church History of Antonio de Dominis* (Oxford, 1859).

DOMINOES, a game played with rectangular blocks of wood or other material, each identified by the number of dots on its face. Such a block is usually $1\frac{1}{2}$ to 2 in. in length, its width being about half its length and its thickness about one-eighth its length. The blocks are usually called *bones*, *dominoes* or *pieces*, but are sometimes called *men*, *stones* or even *cards*.

The face of each piece is divided by a line or ridge, into two square *ends*, and is marked similarly to a pair of dice side by side except that some ends are blank. The usual set comprises 28 pieces, respectively marked 6 6 ('Double six,' etc.) 5 5, 6 4, 6 3, 6 2, 6 1, 6 0, 5 5, 5 4, 5 3, 5 2, 5 1, 5 0, 4 4, 4 3, 4 2, 4 1, 4 0, 3 3, 3 2, 3 1, 3 0, 2 2, 2 1, 2 0, 1 1, 1 0, 0 0. Any group of pieces having a common end comprise a *suit*. Of two bones the one bearing the greater number of dots is *heavier*, the other *lighter*. Some sets run up to 99 and others as high as 112.

Dominoes in China are as ancient, or almost, as playing cards (see CARDS, PLAYING). They were apparently designed to represent all the possible throws with two dice, for Chinese dominoes

(which they call "dotted cards") have no blank faces. It does not necessarily follow however, that European dominoes were derived from the Chinese. In Europe dominoes are relatively new (there being no record of them before the middle of the 18th century in Italy and France). Apparently they were introduced into England by French prisoners toward the end of the 18th century. The name may have been derived from pieces made of

ebony with ivory faces and resembling the black cloth called a domino.

The Inuit Eskimos gamble wildly at their dominoes games, sometimes staking and losing their wives in play. Their game, in which they use as many as 148 pieces was derived from the European game.

The principle in nearly all modern dominoes games is the matching of one end to another, identically or reciprocally numbered. The principal varieties are:

The Block and Draw Games—Two play. The dominoes are shuffled face downward on the table. The lead, or *set*, is usually decided by drawing for the highest bone, but it is sometimes held that any doublet takes precedence. The bones are then reshuffled, and each player draws at random the number of bones required for the particular form of the game usually seven. The bones left behind are called the *stock* (or, in the U.S., the bone yard).

The leader plays first, generally playing his highest domino, since at the end the player loses according to the number of pips in the bones he has left in his hand.

By some rules, a player after playing a double may play another bone which matches it, e.g., if he plays double six he may play another bone which has a six at one end. The second player has to match the leader's *pose* by putting one of his bones in *juxta* position at one end, i.e., if the leader plays four-five, the second player has to play a bone which contains either a four or a five,

the five being applied to the five or the four to the four. Doublets are placed *à cheval* (crosswise). If a player cannot match, he says "go," and his opponent plays, unless the Draw game—the usual game—is being played, in which case the player who cannot match draws from the stock (two bones must always be left in stock) until he finds a bone that matches. If a player succeeds in posing all his bones, he calls "Domino!" and wins the hand, scoring as many points as there are pips on the bones still held by his opponent. If neither player can match, that player wins who has the fewest pips left in his hand and he scores as many points as are left in the two hands combined (sometimes only the excess held by his opponent), but when a player has called "Go!" his adversary must match if he can, in which case the other player may be able to match in turn. A game may be 50 or 100 points.

BY COURTESY OF THE SMITHSONIAN INSTITUTION
KOREAN DOMINO PIECES

The set consists of 32 pieces made of wood bone or ivory. There are no blanks.

All Fives (or Muggins)—Each player takes five bones. If the leader poses either double five, six-four, five blank, or three-two, he scores the number of pips that are on the bone. If in the course of play a player can play such a bone as makes the sum of the end pips 5, 10, 15 or 20, he scores that number, e.g., if to two four he can play double four (*à cheval*) he scores 10, if to six one he plays six four he scores 5. He must pose if he can match, if he cannot he draws until he can. Scores are called and taken

immediately. At the point of the domino, the winner scores in points the multiple of five which is nearest to the number of pips in his adversary's hand, e.g., he scores 25 if his adversary has 27 pips, 30 if he has 28. If neither hand can match, the lowest number of pips wins, and the score is taken as before, without addition or subtraction, according to the adversary's pips.

All Threes is played in the same manner as Muggins, save that three or some multiple of three is aimed at.

Threes and Fives is similar, but only one point is scored for each five or three made at the two ends, though they can be scored in combination. Thus A plays six five, B six-one, B scores 2 points for five one (two threes). A plays one five, B double-five, B now scores 8 more, 5 for five threes and 3 for three fives.

Sniff, very popular in the U.S. lends itself to skilful play better than most dominoes games. It is essentially All Fives (described above). Two may play, drawing seven bones each, or three or four, drawing five bones each. The first double played is called *sniff*. The sniff may first be put down endwise (in which case only one of its ends then counts) or sidewise, at the holder's option, thereafter it is permissible to play to this bone both endwise and sidewise, so that there are usually four "open ends" with which to reckon. One need not play, although able to, if he wishes instead to draw from the stock, but the last two bones may never be drawn, and since the holding of additional bones may be an advantage it is customary to limit each player to two draws, after which he must play if able and pass if unable to play.

Domino Whist is played by four players. Partners are drawn for as at whist, the player drawing the highest domino leads. Each player takes seven bones. There are no tricks, trumps or honours. The bones are played as in ordinary dominoes, a hand being finished when one of the players plays his last bone, or when both ends are blocked. Pips are then counted, and the holder or holders of the highest number score to their debit the aggregate number of points. The side that is first debited with 100 points loses the game.

Matador—This is a favourite and is also one of the most scientific forms of the game. It is played on a different principle from the preceding variations, the object being not to match the end number, but to pose such a number as, added to the end, will make seven, e.g., to a five a two must be played, to a three a four, etc. Seven dominoes are drawn and the highest double begins. When a player cannot make a seven on either end he must draw from stock until he secures a bone that will enable him to make seven, two bones remaining in the stock. As Matador is played with dominoes no higher than six, a blank means blocking of that end. In this case no further play can take place at that end excepting by posing a matador, which may be played at any time. There are four matadors, the 6-1, 5-2, 4-3, and double blank. It is often better to draw one or more fresh bones than to play one's last matador. In posing a double counts as a single number only, but in scoring the full number of pips is counted. When the game has been definitely blocked the player whose pips aggregate the lower number scores the number of the combined hands (some times only the excess in his opponent's hand), the game being usually 100. Matador can be played by three persons, in which case the two having the lowest scores usually combine against the threatening winner, and also by four, either each for himself or two on a side. Four players only draw five bones each.

See F. W. Lewis, *Dominoes*, A. H. Morehead, *The Modern Hoyle* (1944).

DOMINUS, the Latin word for master or owner. As a title of sovereignty the term under the republic at Rome had all the associations of the Greek *ῥόπαρος*, refused during the early principate, it finally became an official title of the Roman emperors under Diocletian. *Dominus*, the French equivalent being *sieur*, was the Latin title of the feudal (superior and mesne) lords, and also an ecclesiastical and academic title. The ecclesiastical title was rendered in English "sir," which was a common prefix before the Reformation for parsons, as in "Sir Hugh Evans" in Shakespeare's *Merry Wives of Windsor*. The academic use was for a bachelor of arts and so is still used at Cambridge and other universities. The shortened form "dom" is used as a prefix of honour for

ecclesiastics of the Roman Church and especially for members of the Benedictine and other religious orders. The same form is also a title of honour in Portugal, as formerly in Brazil, used by members of the blood royal and others on whom it has been conferred by the sovereign. The Spanish form "don" is also a title, formerly applicable only to the nobility, and now one of courtesy and respect applied to any member of the better classes. The feminine form "doña" is similarly applied to a lady.

The English colloquial use of "don" for a fellow or tutor of a college at a university is derived either from an application of the Spanish title to one having authority or position, or from the academic use of *dominus*. The earliest use of the word in this sense appears, according to the *New English Dictionary*, in South's Sermons (1660). An English corruption "dan" was in early use as a title of respect, equivalent to "master." The literary application to poets is due to Spenser's use of "Dan Chaucer, well of English undefyled" (*Faery Queen*, IV, ii, 32).

DOMITIAN (TITUS FLAVIUS DOMITIANUS), Roman emperor A.D. 81–96, the second son of Vespasian, was born at Rome on Oct. 24, A.D. 51. When Vespasian was proclaimed emperor at Alexandria, Domitian escaped with difficulty from the temple of the capitol, which had been set on fire by the Vitellians, and remained in hiding till his father's party proved victorious. After the fall of Vitellius he was saluted as Caesar by the troops, obtained the city praetorship, and was entrusted with the administration of Italy until his father's return from the east. But although in his father's lifetime he was several times consul, and after his death was nominally the partner in the empire with his brother Titus, he took no part in public business, but lived in great retirement, devoting himself to a life of pleasure and of literary pursuits until he succeeded to the throne.

The death of Titus, if not hastened by foul means, was at least eagerly welcomed by his brother. Domitian's succession (on Sept. 13, 81) was unquestioned, and it would seem that he had intended so far as his weak volition and mean abilities would allow, to govern well. Like Augustus, he attempted a reformation of morals and religion. He erected many temples and public buildings (among them the Odeum, a kind of theatre for musical performances) and restored the temple of the capitol. He passed many sumptuary laws, and issued an edict forbidding the over cultivation of vines to the neglect of corn-growing. Finally, he took a personal share in the administration of justice at Rome, checked the activity of the informers (*delatores*) and exercised a jealous supervision over the governors of provinces. Even when Rome and Italy smarted beneath his proscriptions and extortions, the provinces were undisturbed.

Though he took the title of imperator more than 20 times, and enjoyed at least one triumph, Domitian's military achievements were insignificant. He defeated the Chatti, annexed the district of the Taunus, and established the *Limes* as a line of defence, but he suffered defeats at the hands of the Quadi, Sarmatae and Marcomanni, in Dacia he received a severe check and was obliged to purchase peace (90) from Decebalus by the payment of a large sum of money and by guaranteeing a yearly tribute—the first instance in Roman history. His jealousy was provoked by the successes of Agricola in Britain, who was recalled to Rome (85) in the midst of his conquests, condemned to retirement, and perhaps removed by poison. The revolt of Antonius Saturninus, the commander of the Roman forces in upper Germany (88 or 89), marks the turning point in his reign (on the date see H. Schiller, *Geschichte des römischen Kaiserzeit*, I, pt. 2, p. 524, note 2). It was speedily crushed, but from that moment Domitian's character changed. He got rid of all whom he disliked on the charge of having taken part in the conspiracy, and no man of eminence was safe against him. He was in constant fear of assassination and distrusted all around him. During the last three years of his life his behaviour was that of a madman. He sentenced to death his own cousin and nephew by marriage, Flavius Clemens, whose wife he banished for her supposed leaning towards Judaism (Christianity). He was stabbed in his bedroom by a freedman of Clemens named Stephanus on Sept. 18, 96.

DOMREMY-LA-PUCELLE, a village of eastern France, in the department of Vosges on the left bank of the Moselle, 7 mi N. of Neufchâteau by road Pop. (1936) 248. Domremy was the birthplace of Joan of Arc and the cottage in which she was born still stands. Above the door are the arms of France and of Joan of Arc and in inscription of 1481 reading *Vive laboure, vive le roi Louis*. There are several monuments to the heroine and a modern basilica has been erected in her honour on a neighbouring hill where she is said to have heard the voices in obedience to which she took up the sword. The story of the heroine is annually celebrated by a play in which the villagers take part.

DON, river south Aberdeenshire, Scotland rising in peat moss to the east of Glen Avon on the border of the English, at a height of nearly 2,000 ft. It follows a generally easterly course roughly parallel with that of the Dee, and a few miles north of it, falling into the North Sea close to Old Aberdeen, after a run of 82 mi. At the mouth the two rivers are only 2½ mi apart. Dee and Don are excellent salmon rivers.

DON, a river of European Russia (inc. *Tanais*), called *Tana* or *Duna* by the Tatars rising in Lake Ivan (50 ft above sea level) in the province of Tula where it has communication with the Volga by means of the Yezui canal, which links it with the Upa, a tributary of the Oka, which itself enters the Volga. The Don after curving east through Ryazan, flows generally south through Tambov, Orel, Voronezh and the North Caucasian area, describing in the last named a sweeping loop to the east, in the course of which it approaches within 48 mi. of the Volga in 49° N. In the province of Stalingrad it turns definitely southwest, and finally enters the northeast extremity of the Sea of Azov, forming a delta 130 sq mi in extent. Its total length is 1,325 mi, and its drainage area is calculated at 166,000 sq mi. The average fall of the river is about 54 in. to the mile.

In its upper course, which may be regarded as extending to the confluence of the Voronezh in 51° 40' the Don flows for the most part through a low lying, fertile country, though in Ryazan its banks are rocky and steep and in some places even precipitous. In the middle division, or from the mouth of the Voronezh to the point where it makes its nearest approach to the Volga, the stream cuts its way for the most part through Cretaceous rocks, which in many places rise on either side in steep and elevated banks, and at intervals encroach on the riverbed. A short distance below the town of Rostov it breaks up into several channels, of which the largest and most southern retains the name of the river. Before it receives the Voronezh the Don has a breadth of 500 to 700, or even in a few places 1,000 ft, while its depth varies from 4 to 20 ft, by the time it reaches its most eastern point the depth has increased to 8-30 ft, and the ordinary breadth to 700-1,000 ft, with an occasional maximum of 1,400 ft, in the lowest division the depth is frequently 70 ft and the breadth in many places 1,870 ft. Generally speaking the right bank is high and the left flat and low. Shallow reaches are not uncommon and there are at least seven considerable shoals in the south western part of the course, partly owing to this cause, and partly to the scarcity of ship-burden in the Voronezh province, the Don, although navigable as far up as Voronezh, does not attain any great importance as a means of communication till it reaches Kalach, where the railway (built in 1862) from the Volga has its western terminus. Of the tributaries of the river, the Voronezh the

Khopor, the Medveditsa and the Donets are navigable—the Donets having a course of 680 mi., and during high water affording access to the government of Kharkov. The Manvch, another large affluent on the left marks the ancient line of water connection between the Sea of Azov and the Caspian Sea.

The lower section of the Don is subject to two annual floods, of which the earlier known as the "cold water," is caused by the melting of the snow in the North Caucasian area and the later, or the "warm water," is due to the same process taking place in the region drained by the upper parts of the stream. About the beginning of June the river begins to subside with great rapidity, in August the water is very low and navigation almost ceases, but occasionally after the September rains the traffic with small craft is again practicable. After the middle of the 18th century there have been five floods of extraordinary magnitude—namely in 1748, 1786, 1805, 1820 and 1845. The river is usually closed by ice from November or December to March or April, and at rare intervals it freezes in October. At Ak-sai, in the delta, it remains open on the average for 350 days in the year, at the mouth of the Medveditsa for 230, and at Novocherkassk, on another arm of the delta, for 240. This river supports a considerable fishing population, who despatch salt fish and caviare all over Russia. Salmon and herrings are taken in large numbers. The areas of calcareous soil on its banks is favourable to vine cultivation and "Don Champagne" is in great demand.

DONATELLO (diminutive of Donato) (c. 1386-1466), Italian sculptor, was the son of Niccolò di Betto Bardi, a member of the Florentine Woolcombers' Guild, and was born in Florence probably in 1386. It is certain that Donatello received his first training in a goldsmith's workshop, and that he worked for a short time in Ghiberti's studio. He was too young to enter the competition for the baptistery gates in 1402, from which Ghiberti issued victorious against Brunelleschi, Jacopo della Quercia, Niccolò d'Arezzo and other rivals. But when Brunelleschi in his disappointment left Florence and went to Rome to study the remains of classic art he was accompanied by young Donatello. This Roman sojourn was decisive for the entire development of Italian art in the 15th century, for it was during this period that Brunelleschi undertook his measurements of the Pantheon dome and of other Roman buildings, which enabled him to construct the noble cupola of S. Maria del Fiore in Florence, while Donatello acquired his knowledge of classic forms and ornamentation. The two masters, each in his own sphere, were to become the leading spirits in the art movement of the 15th century. Brunelleschi's buildings and Donatello's monuments are the supreme expression of the spirit of the early Renaissance in architecture and sculpture and exercised a potent influence upon the painters of that age.

Donatello probably did not return to Florence before 1405, since the earliest works in that city that can be traced to his chisel are two small statues of "prophets" for the north door of the cathedral, for which he received payment in Nov. 1406 and 1408. In the latter year he was entrusted with the important commissions for the marble "David," now at the Bargello, and for the colossal seated figure of "St. John the Evangelist," which until 1388 occupied a niche of the old cathedral façade, and is now placed in a dark chapel of the Duomo. He was next employed at Or San Michele, where between 1340 and 1406 only four of the 14 niches had been filled. As the result of a reminder sent by the Signory to the guilds who had undertaken to furnish the statues, the services of Cuffagni, Nanni di Banco, Ghiberti and Donatello were enlisted, and Donatello completed between 1412 and 1415 the "St. Peter," the "St. George" (the original, now in the Bargello, has been replaced by a copy) and the "St. Mark." He probably also assisted Nanni di Banco in his group of four saints. To this early period belongs the wooden crucifix in S. Croce, the most striking instance of Donatello's realism in rendering the human form and his first attempt at carving the nude. It is said that this crucifix was executed in rivalry with Brunelleschi's noble work at S. Maria Novella, and that Donatello, at the sight of his friend's work, exclaimed, "It has been left to you to shape a real Christ, whilst I have made a peasant." In

this early group of statues, from the prophets for the cathedral door to the "St. George," can be followed the gradual advance from Gothic stiffness of attitude and draping to a forceful rendering of the human form and of movement, which is a distinct approach to the classic ideal. All these figures were carved in marble and are admirably conceived in relation to their architectural setting. In fact, so strong is this tendency that the "St. Mark," when inspected at the master's workshop, was disapproved by the heads of the Guild of Linen weavers, but aroused public enthusiasm when placed *in situ*.

Between the completion of the niches for Or San Michele and his second journey to Rome in 1433, Donatello was chiefly occupied with statuary work for the campanile and the cathedral, though from this period dates the bronze figure of the Baptist for the christening font of Orvieto cathedral, which was never delivered and is now among the treasures of the Berlin museum. This, and the "St. Louis of Toulouse," which originally occupied a niche at Or San Michele and is now badly placed at S. Croce, were the first works in bronze which owed their origin to the partnership of Donatello with Michelozzo, who undertook the casting of the models supplied by his senior. The marble statues for the campanile, which are either proved to be Donatello's by documentary evidence or can be recognized as his work from their style, are the "Abraham" wrought by the master in conjunction with Giovanni di Bartolo (di Rosso), the "St. John the Baptist," the so-called "Zuccone" (Jonah?), "Jeremiah," "Habakkuk" (?), the unknown "prophet" who is supposed to bear the features of the humanist Poggio Bracciolini, and possibly he may have had a share in the completion of the "Joshua" commenced by Cuiufanti in 1415. All these statues, and the "St. John" at the Bargello, mark a bold departure from the statuette balance of the "St. Mark" and "St. George" to an almost instantaneous impression of life. The fall of the draperies is no longer arranged in harmonious lines, but is treated in an accidental, massive, bold manner. At the same time the heads are no longer, as it were, impersonal, but almost cruelly realistic character portraits of actual people, just as the arms and legs and necks are faithfully copied from life with all their angulancies and deviations from the lines of beauty. During this period Donatello executed some work for the baptistal font at S. Giovanni in Siena, which Jacopo della Quercia and his assistants had begun in 1416. Though the Florentine's share in it is confined to a relief which may have been designed, or even begun, by Jacopo, and a few statuettes, it is of considerable importance in Donatello's life-work, as it includes his first attempt at relief sculpture—except the marble relief on the socle of the "St. George"—his first female figures—"Faith" and "Hope," and his first *putti*. The relief, "Herod's Feast," shows already that power of dramatic narration and the skill of expressing the depth of space by varying the treatment from plastic roundness to the finest *staccato*, which was to find its mature expression in the panels of the altar of S. Antonio in Padua and of the pulpit of S. Lorenzo in Florence. The casting of the pieces for the Siena font was probably done by Michelozzo, who is also credited with an important share in the next two monumental works, in the designing of which Donatello had to face a new problem—the tomb of John XXIII in the baptistery (begun about 1425), and that of Cardinal Brancacci at S. Angelo a Nilo in Naples (executed in Pisa, 1427). The noble recumbent figure of the defunct on the former, the relief on the sarcophagus, and the whole architectural design, are unquestionably due to Donatello, the figure of the pope is the most beautiful tomb figure of the 15th century, and served as the model on which Rossellino, Desiderio and other sculptors of the following period based their treatment of similar problems. Donatello's share in the Naples monument is probably confined to the characteristic low relief of the "Ascension." The baptistery tomb shows how completely Donatello had mastered the forms of Renaissance architecture, even before his second visit to Rome. An earlier proof of his knowledge of classic art is his niche for the "St. Louis" at Or S. Michele, now occupied by Verrocchio's "Christ and St. Thomas." Similar in treatment to the "Ascension" relief is the "Charge to St. Peter"

at South Kensington, which is almost impressionistic in its suggestion of distance and intervening atmosphere expressed by the extreme slightness of the relief.

When Cosimo was exiled from Florence in 1433, Michelozzo accompanied him to Venice, whilst Donatello went to Rome to drink once more at the source of classic art. The two works which still testify to his presence in this city, the "Tomb of Giovanni Crivelli" at S. Maria in Araceli, and the "Ciborum" at St. Peter's, bear the stamp of classic influence. Donatello's return to Florence in the following year almost coincides with Cosimo's. Almost immediately, in May 1434, he signed a contract for the marble pulpit on the façade of Prato cathedral, the last work executed in collaboration with Michelozzo, a veritable bacchanal dance of half nude *putti*, pagan in spirit, passionate in its wonderful rhythmic movement—the forerunner of the "singing tribune" for Florence cathedral, at which he worked intermittently from 1433 to 1440, and which is now restored to its original complete form at the museum of the Opera del Duomo. But Donatello's greatest achievement of his "classic period" is the bronze "David" at the Bargello, the first nude statue of the Renaissance, the first figure conceived in the round, independent of any architectural surroundings—graceful, well proportioned, superbly balanced, suggestive of Greek art in the simplification of form, and yet realistic, without any striving after ideal proportions. The same tendencies are to be noted in the bronze *putti* at the Bargello.

In 1443 Donatello was invited to Padua to undertake the decoration of the high altar of S. Antonio, but in the period preceding his departure he not only assisted Brunelleschi in the decoration of the sacristy of S. Lorenzo, towards which the bronze doors are his chief contribution, but found time to chisel, or model in wax or terra-cotta, for Cosimo and other private patrons, most of the portrait busts and small reliefs, which are now distributed over the museums of the world. His first work in Padua was the bronze crucifix for the high altar, a work immeasurably superior to the early wooden crucifix at S. Croce, both as regards nobility of expression and subtlety of form. In the very year when Donatello arrived in Padua the famous Condottiere Erasmo de' Narni, called Gattamelata, had died, and when it was decided to honour his memory with an equestrian statue, it was only natural that this master should be chosen to undertake a task from the difficulties of which all others may well have shrunk. This commission, and the reliefs and figures for the high altar, kept Donatello in Padua for ten years, though during that time he visited Venice (where he carved the wooden "St. John" at the Frari) and probably Mantua, Ferrara and Modena. In his workshop in Padua he gathered around him quite a small army of assistants, stone carvers, metal workers, painters, gliders and bronze casters. The Gattamelata was finished and set up in 1453—a work powerful and majestic in its very repose, there is no striving for dramatic effect, no exaggerated muscular action, but the whole thing is dominated by the strong, energetic head, which is modelled with the searching realism of the Zuccone and the Poggio heads. The high altar, for which Donatello executed 22 reliefs, seven statues and the crucifix, was completed in 1450, but had subsequently to undergo many changes, in the course of which the original disposition of the sculptures was entirely lost sight of, the present arrangement being due to Camillo Botto (1895). The chief features of the altar are the wonderfully animated and dramatic bronze reliefs, four in number, of the "Miracles of St. Anthony."

With the exception of another visit to Siena in 1457, of which the bronze "St. John" in the cathedral is a reminder, Donatello spent the remaining years of his life in Florence. Closely akin to the rugged "St. John" at Siena and therefore probably contemporaneous, is the repulsively ugly, emaciated "Magdalen" at the baptistery in Florence. The dramatic intensity of the "Judith" group in the Loggia de' Lanzi, which was originally placed in the court of the Medici Palace, marks it as belonging to the post-Paduan period of the master's life. His last work of importance was the bronze reliefs for the pulpit of S. Lorenzo, commissioned about 1460, and finished after Donatello's death by his pupil

Bertoldo The reliefs of the "Flagellation" and "Crucifixion" at the Victoria and Albert Museum are typical examples of the master's style at this closing period of his life. He died on Dec. 13, 1466.

Donatello, whose supreme mastery had been acknowledged by Michelangelo, Raphael and the other giants of the late Renaissance, almost sank into oblivion during the 18th and early 19th centuries, and only in comparatively recent times has he been restored to the eminent position which is his due in the history of art. The full power of his genius was only revealed to the world when, at the quinquenary celebration of his birth, the greater part of his life-work was brought together in Florence. The large hall at the Bargello has ever since been devoted to the display of his works, the numerous original bronzes and marbles and terracottas being supplemented by casts of works at other places.

DONATI, GIOVANNI BATTISTA (1826-1873), Italian astronomer, was born at Pisa on Dec. 16, 1826. In 1854-64 he discovered six comets, one of which, first seen on June 2, 1858, bears his name. On Aug. 5, 1864, he discovered the gaseous composition of comets by submitting to spectroscopic analysis the light of one then visible.

DONATIO MORTIS CAUSA (grant in case of death), in law, a gift of personal property made in contemplation of death and intended either expressly or impliedly to take complete effect only if the donor dies of the illness affecting him at the time of the gift. The conception as well as the name is borrowed from Roman law, and the definition given by Justinian (*Inst.* ii, 7, 1) applies equally to a *donatio mortis causa* in Roman and English law. A distinction, however, has arisen between the English and civil codes, by English law delivery either actual or (when from the nature of the thing actual delivery is impossible) constructive is essential, and this delivery must pass not only the possession but the dominion of the thing given, by the civil law, delivery of possession was not essential. A *donatio mortis causa* is half way between a gift *inter vivos* and a legacy, and has some of the characteristics of each form of disposition. It resembles a legacy in that (1) it is revocable during the donor's life, (2) it is subject to death duties, (3) it is liable to satisfy debts of the testator in default of other assets. On the other hand, it resembles a gift *inter vivos* in that it takes effect from delivery, therefore the consent of the executor is not necessary. Anything may be the subject of a *donatio mortis causa*, the absolute property in which can be made to pass by delivery after the donor's death either in law or equity, this will cover bankers' deposit notes, bills of exchange and notes and cheques of a third person, but not promissory notes and cheques of the donor in favour of the donee, for the donor's signature is merely an authority for his banker to pay, which is revoked by his death.

DONATION OF CONSTANTINE (*Donatio Constantini*), the supposed grant by the emperor Constantine, in gratitude for his conversion by Pope Silverius, to that pope and his successors for ever, not only of spiritual supremacy over the other great patriarchates and over all matters of faith and worship, but also of temporal dominion over Rome, Italy and "the provinces, places and civitates of the western regions."

The famous document, known as the *Constitutum Constantini*

and compounded of various elements (notably the apocryphal *Vita S. Silverii*), now universally admitted to be a gross forgery, was fabricated perhaps, at Rome, more probably in the Frankish empire, between the middle and the end of the 8th century, was included in the 9th century in the collection known as the *Falsæ Decretals*, and two centuries later was incorporated in the *Decretum* by a pupil of Gratian. The evidence for its Roman origin is internal, that for its origin in the Frankish dominions is based on the facts that the earliest manuscript containing it appears to have been written there and that the earliest certain quotation from it is by a Frankish author. It was regarded as genuine both by the friends and the enemies of the papal pretensions throughout the middle ages, though at the close of the 16th century, Leo of Vercelli, Otto III's chancellor, proclaimed its true character, as, in 1542, did the heretical followers of Arnold of Brescia. Although it was in existence before 800, the earliest certain appearance of it by a pope was made in 1054 by Leo IX, who was a German by birth and training. From this time forward it was increasingly employed by popes and canonists in support of the papal claims, and from the 12th century onward became a powerful weapon of the spiritual against the temporal powers. It is, however, as Cardinal Hergenrother points out, possible to exaggerate its importance in this regard. By the partisans of the empire the donation was looked upon as the *fontes et origo malorum*, and Constantine was regarded as having in his new born zeal, betrayed his imperial trust.

The genuineness of the *Constitutum* was first critically assailed by Laurentius Valla in 1510, whose *De falso credita et ementita Constantini donatione declamatio* opened a controversy that lasted until, at the close of the 18th century, the defense was silenced. In modern times the controversy as to the genuineness of the document has been succeeded by a debate scarcely less lively as to its date, its authorship and place of origin. The efforts of Roman Catholic scholars have been directed (after Caesar Baronius ascribed the forgery to the Greeks) to proving that the fraud was not committed at Rome while non-Roman Catholic scholars have called attention to the rarity of appeals to this document by the popes until the middle of the 15th century, when such appeals were made not to enlarge their own territorial possessions but rather to dispose of lands newly acquired (A. J. Carlyle, *Medieval Political Theory in the West*, I, 290 (1903-28). F. Zinkens in *Eng. Hist. Rev.* 1894, IX, 625-632). The view held by E. Gibbon, Johann von Dollinger (*Papstfabeln des Mittelalters*, Eng. tr. 1871) and others, that the *Constitutum* is referred to in the letter of Adrian I to Charlemagne (778), is now largely rejected, and the same must be said of Johann Friedrich's attempt to find such reference in the letter addressed in 785 by the same pope to Constantine VI, emperor of the east, and his mother Irene. Still less safe is it to ascribe the authorship of the forgery to any particular pope on the ground of its style, for papal letters were drawn up in the papal chancery, and the style employed there was apt to persist through several pontificates, nor is the style alone sufficient proof that it was drafted in Italy.

On one point, however, agreement seems now to have been reached, a result due to the labours of Paul Scheffer Boichorst (*Mitteilungen des Instituts für osterr. Geschichtsforschung*, x, 1880, xi, 1890), namely, that the style of the *Constitutum* is generally that of the papal chancery in the latter half of the 8th century. Thus being granted there is room for plentiful speculation as to where and why it was concocted. We may still hold the opinion of Dollinger that it was intended to impress the barbarian Pippin and justify in his eyes the Frank intervention in favour of the pope in Italy, or we may share the view of L. Loening that the forgery was a pious fraud on the part of a cleric of the Curia, committed under Adrian I, with the idea of giving a legal basis to territorial dominion which that pope had succeeded in establishing in Italy. The donations of Pippin and Charlemagne established him as sovereign *de facto*, the donation of Constantine was to proclaim him as sovereign *de jure*. It is significant in this connection that it was under Adrian (c. 774) that the papal chancery ceased to date by the regnal years of the eastern emperor and substituted that of the pontificate. Thomas Hodgkin (Italy and her Invaders, vii, 151, 1899), impressed by the scant use made of this document for several centuries after its origin, regarded it as a pious romance which, when rediscovered after a long lapse of time was accorded an authenticity not claimed by its author or his contemporaries. Dollinger's view is supported and carried a step further by G. H. Bohmer (art. "Konstantinische Schenkung," in J. Herzog-A. Hauck, *Realencyclopädie*), who by an ingenious argument endeavours to prove that the *Constitutum* was forged in 751, probably by the notary Christophorus, and was carried with him by Pope Stephen II to the court of Pippin, in 754, with an eye to the acquisition of the Exarchate. In support of this argument it is to be noted that the forged document first appears at the abbey of St. Denis where Stephen spent the winter of 754. E. Mayer (Die Schenkungen Konstantins und Pippins," *Deutsche Zeitschrift für Kirchenrecht*, 1904), on the other hand, denies that the *Constitutum* can have been forged before the news of the iconoclastic decrees of the council of Constantinople of 754 had reached Rome. He lays stress on the relation of the supposed confession of faith of Constantine, embodied in the forgery, to that

issued by Constantine V, pointing out the efforts made by the Byzantines between 756 and the synod of Gentilly in 767 to detach Pippin from the cause of Rome and the holy images. The forgery thus had a double object as a weapon against Byzantine heresy and as a defense of the papal patrimony. As the result of an exhaustive analysis of the text and of the political and religious events of the time, Mayer comes to the conclusion that the document was forged about 774, i.e., at the time when Charlemagne was beginning to reverse the policy by which in 774 he had confirmed the possession of the duchies of Spoleto and Benevento to the pope. The defense of the new Western Empire from Byzantine attacks was probably the original purpose of this forgery, but it should not be forgotten that its importance and use in disputes between the papacy and the secular power did not begin until the 11th century. None of the problems regarding the sources, place and date of the forgery, or its purpose have yet been definitely solved.

In addition to works already mentioned, see Joseph von Hergenrother, *Catholic Church and Christian State* (Freiburg im Breisgau, 1872, Eng. trans. 2 vols., 1876), W. Maîtres, *Die römische Frage unter Papst u. Karol. d. Großen* (Stuttgart, 1881), with text, L. Weiland, "Die Konst. Schenkung," in *Zeitschrift f. Kirchengeh.*, xii (1887-1888), maintaining that the *Constitutum* was forged at Rome between 813 and 875, in connection with the papal claim to crown the emperors, with text, Friedrich, *Die Konst. Schenkung* (Nordlingen, 1889), with text, W. Meyers, *Die falsche Generalkonvention Konstantins des Grossen* (Munich, 1880), G. Krüger, "Die Frage der Entstehungszeit der Konst. Schenkung," in *Theologische Literaturzeitung*, xiv (1889), Laurentius Valla's treatise was issued in a new edition, with French translation and historical introduction, by A. Bonneau, *La Donation de Constantin* (Lussex 1879). J. Langen, "Entstehung und Tendenz der Konstantinischen Schenkungsurkunde," in *Historische Zeitschrift f. Kirchenrecht*, 137 sqq., 185 sqq. (1889), Loening, "Die Entstehung der Konstantinischen Schenkungsurkunde," in *Historische Zeitschrift*, 193 sqq. (1890), G. L. Burr in *Cambridge Medieval History*, II, 586-587 (1925) (L. B. H.).

DONATISTS, a powerful sect which arose in the Christian church of northern Africa at the beginning of the 4th century. In its doctrine it sprang from the same roots, and in its history it had in many things the same character, as the earlier Novatians. The predisposing causes of the Donatist schism were the belief, early introduced into the African church, that the validity of all sacerdotal acts depended upon the personal character of the agent, and the question, arising out of that belief, as to the eligibility for sacerdotal office of the *traditores*, or those who had delivered up their copies of the Scriptures under the compulsion of the Diocletian persecution, the exciting cause was the election of a successor to Mensurius, bishop of Carthage (d. 311). Mensurius had held moderate views as to the treatment of the *traditores*, and accordingly a strong fanatical party, supported by Secundus, bishop of Tigisis and primate of Numidia, had formed itself in Carthage in opposition to him. There were thus two parties, each anxious to secure the succession to the vacant see. The friends of the late bishop fixed their choice on Caecilian, the archdeacon, and secured his election and his consecration by Felix, bishop of Aptunga, before the other party were ready for action. It had been customary for the Numidian bishops to be present at the election and consecration of the bishop of Carthage, who as metropolitan of proconsular Africa occupied a position of primacy towards all the African provinces. Caecilian's party, however, had not waited for them, knowing them to be in sympathy with their opponents. Soon after Caecilian's consecration Secundus himself with 70 of the Numidian bishops arrived at Carthage. A synod of Africa was formed, before which Caecilian was summoned, his consecration was declared invalid, on the ground that Felix had been a traitor, and finally, having refused to obey the summons to appear, he was excommunicated, and the "reader" Majorinus consecrated in his stead.

To investigate the dispute Constantine issued a commission to five Gallic bishops, under the presidency of Melchades, bishop of Rome. Ten bishops appeared on each side, the leading representative of the Donatists being Donatus of Casae Nigrae. The decision was entirely in favour of Caecilian, and Donatus was found guilty of various ecclesiastical offences. An appeal was taken and allowed, but the decision of the synod of Arles in 314 not only confirmed the position of Caecilian, but greatly strengthened it by passing a canon that ordination was not invalid because performed by a traitor, if otherwise regular. Felix had previously been declared innocent after an examination of records and witnesses at Carthage. A further appeal to the emperor in

person was heard at Milan in 316, when all points were finally decided in favour of Caecilian, probably on the advice of Hosius, bishop of Cordova. Henceforward the power of the state was directed to the suppression of the defeated party. Persistent Donatists were no longer merely heretics, they were rebels and incurred the confiscation of their church property and the forfeiture of civil rights.

The attempt to destroy the sect by force had the result of intensifying its fanaticism. Majorinus, the Donatist bishop of Carthage, died in 315, and was succeeded by Donatus, surnamed Magnus, a man of great force of character after whom the movement was named, and under whose influence it gained fresh strength from the opposition it encountered. In 321 Constantine seeing probably that he had been wrong in abandoning his usual policy of toleration, sought to retrace his steps by granting the Donatists liberty to act according to their consciences, and declaring that the points in dispute between them and the orthodox should be left to the judgment of God. This wise policy, to which he consistently adhered to the close of his reign, was not followed by his son and successor Constantius, who, after repeated attempts to win over the sect by bribes, resorted again to persecution, many of their bishops falling victims and Donatus and others being banished. The power which they had been the first to invoke having thus declined so emphatically and persistently against them, the Donatists revived the old world alien Christianity of the days of persecution, and repeated Tertullian's question, "What has the emperor to do with the church?" (*Quid est imperatori cum ecclesia?*)

With the accession of Julian (361) an entire change took place, their churches were restored to the Donatists and their bishops reinstated, with the natural result of greatly increasing both the numbers and the enthusiasm of the party. A return to the earlier policy of repression was made under Valentinian I and Gratian, by whom the churches were again closed, and all assemblies forbidden. It was not, however, until the commencement of the 5th century that the sect began to decline, owing largely to the rise among them of a group of moderate and scholarly men like the grammarians Tychonius, who vainly strove to overcome the more fanatical section. Against the house thus divided against itself both state and church directed not unsuccessful assaults. In 405 an edict was issued by the emperor Honorius commanding the Donatists, under the severest penalties, to return to the Catholic church. On the other hand, Augustine, bishop of Hippo, after several years' negotiation, arranged a great conference between the Donatists and the orthodox, which was held under the authority of the emperor at Carthage in 411. There were present 286 Catholics and 270 Donatist bishops. Before entering on the proceedings the Catholics pledged themselves, if defeated, to give up their sees, while in the other event they promised to recognize the Donatists as bishops on their simply declaring their adherence to the Catholic church. The latter proposal, though it was received with scorn at the time, had perhaps ultimately as much influence as the logic of Augustine in breaking the strength of the schism. The discussion, which lasted for three days, turned exclusively upon the two questions that had given rise to the schism—first, the question of fact, whether Felix of Aptunga who consecrated Caecilian had been a traitor, and secondly, the question of doctrine, whether a church by tolerance of unworthy members within its pale lost the essential attributes of purity and catholicity. The Donatist position, like that of the Novatians and, earlier, of the Montanists (*q.v.*) was that the church is a society of holy persons, and that the mark of the true church is to guard the essential predicate of holiness by excluding all who have committed mortal sin, the Catholic standpoint was that such holiness is not destroyed by the presence of unworthy members in the church but rests upon the divine foundation of the church and upon the gift of the Holy Spirit and the communication of grace through the priesthood. In the words of Optatus of Mileve, *sacramenta de sacramentis colliguntur, non de superbia personarum pondera*. And the much wider diffusion of the orthodox church was also taken as practical confirmation that it alone possessed what was regarded as the equally essential predicate of catholicity.

The decision of Marcellinus, the imperial commissioner, was in favour of the Catholic party on both questions, and it was at once confirmed on an appeal to the emperor. The severest penal measures were enforced against the schismatics, in 414 they were denied all civil rights, in 415 the holding of assemblies was forbidden on pain of death. But they lived on, suffering with their orthodox brethren in the Vandal invasions of the 5th century, and like them finally disappearing before the Saracen onslaught two centuries later.

BIBLIOGRAPHY.—For contemporary sources see Optatus Milevitanus *De Schismate Donatistarum adversus Parmenianum*, written c. 368 (Migne, *Patrologia Latina*, vol. xi), and several of the works of Augustine. Among modern authorities reference should be made to O. Bardenheuer, *Geschichte der altchristlichen Literatur*, III, 488–98, IV, 467–73, 512 f.; J. Chapman, *Donatus the Great and Donatus of Caeser in Revue Benedictine* 26 (1909) 13–23; P. Monceaux, *Historie littéraire de l'Afrique chrétienne*, IV and VI (1913 and 1923); H. von Soden, *Urkunden zur Entstehungsgeschichte des Donatismus* (1913).

DONATUS, AELIUS, Roman grammarian and teacher of rhetoric, flourished in the middle of the 4th century A.D. He was the tutor of St Jerome. Of his numerous works, the following are extant: the *Arts grammatica*, most of his commentary on Terence (a compilation from other commentaries), but probably not in its original form, and a few fragments of his notes on Virgil, preserved and severely criticized by Servius, together with the preface and introduction, and life of Virgil. The *Arts*, though having little claim to originality, and based on the authorities used by Charisius and Diomedes, became so popular as a school book that in the middle ages the writer's name became a common metonymy (in the form *donatus*) for any rudimentary treatise. It is extant in the form of an *Arts Minor*, which only treats of the parts of speech, and an *Arts Major*, which deals with grammar in general at greater length.

Aelius Donatus is to be distinguished from Tiberius Claudius Donatus, the author of a commentary (*Interpretationes*) on the Aeneid (of far less value than that of Servius), who lived about 50 years later.

The best text of the *Arts* and the commentaries upon it by Servius and others is in H. Keil, *Grammatica Latina*, iv, of the commentary on Terence there is an edition by P. Wessner (1902, Teubner series) with bibliography and full account of mss. See generally E. A. Grafenhan, *Geschichte der klassischen Philologie im Altertum* i (1896); P. Rosenstock, *De Donato, Terentii explicatore* (1886); H. P. Karsten, *De Comm. Don. ad Terentii fabulas origine et compositione* (Leyden, 1907). For the commentary of Tiberius Donatus see O. Ribbeck, *Prolegomena to Virgil*, Grafenhan (as above), and V. Burkus, *De Tiberii Claudii Donati in Aeneidem commentario* (1886). The text will be found in G. Fabricius's edition of Virgil (1501), ed. by H. George, i (1905 foll.). See also R. Sabbadini, *Storia e Critica di Testi Latini* (Catania, 1914), dealing with the mss of the commentaries of Aelius and Tiberius.

DONAUFORT, a town of Germany in the Land of Bavaria on the left bank of the Danube, at the confluence of the Wornitz, 25 mi N of Augsburg by rail and at the junction of lines to Ulm and Ingolstadt. Pop. (1939) 6,041. It grew up during the 11th and 12th centuries under the protection of the castle of Mangoldstein, and became for a time in the 13th a seat of the duke of Upper Bavaria. The town received the freedom of the Empire in 1308, and resisted the encroachments of Bavaria till 1607, when the duke of Bavaria was authorized to punish the Protestant inhabitants for their interference with the abbot of the Heilig-Kreuz. In the Thirty Years' War it was stormed by Gustavus Adolphus (1632), and captured by King Ferdinand (1634). Important battles were fought in the neighbourhood in 1704 and in 1805. The imperial freedom restored to the town by Joseph I in 1705 was again lost by reincorporation with Bavaria in 1714. The Kloster Kirche (monastery) a Gothic edifice, the church of the former Benedictine abbey, Heilig Kreuz, the Gothic town hall and the so-called Tanzhaus, which now includes both a theatre and a school are notable. The industries include machinery, brewing and saw-milling, the place is a river port, and trade is in agricultural produce.

DON BENITO, a town of western Spain, in the province of Badajoz, near the left bank of the river Guadiana, on the Madrid-Badajoz-Lisbon railway. Pop. (1940) 20,613 (mun. 20,931). Don Benito, centre of a fertile district, dates from the 15th cen-

tury, when it was founded by refugees from Don Llorente, driven out of their own town by floods from the Guadiana. Besides manufactures of oil, soap, flour, linen, lace and cloth, it has an active trade in wheat, cattle, wine and fruit, especially melons.

DONCASTER, market town, county borough, Doncaster parliamentary division, West Riding, Yorkshire, England, 156 mi N of London. Pop. (est. 1938) 71,600. Area 12.2 sq mi. It lies astride the ridge dividing the watershed of the rivers Don and Trent. It is the centre of a large coal mining area and an important station on the L.N.E. railway, whose principal locomotive and carriage works are here. It is also served by the L.M.S. railway, stands on the Great North road, and the river Don affords water communication with the Humber and Goole. The parish church of St George (architect Sir G. G. Scott) occupies the site of an older structure, destroyed by fire in 1853. It is a fine cruciform structure of Decorated character, with a central tower 170 ft high, and contains a fine organ. St James's church was erected by the same architect and Lord Grimthorpe. Other important buildings are the guildhall, mansion house, public library, school of art, technical college, coin exchange and market hall. The grammar school was founded in 1553 and has been greatly enlarged. There is a large high school for girls and a school of art, while some of the elementary schools are the finest in the country.

The Doncaster racecourse lies 1 mi S.E. of the town and is owned and managed by the corporation. The old course is 1 mi 7 fur 70 yd long, the Sandall mile was added in 1892 and the straight mile in 1912. Race meetings are normally held in September, October and May. In September the St Leger race, which originated in 1776, is run. The grandstand was erected in 1777 but there are several other stands. Systems of electric tramways, trolley vehicles and motor omnibuses connect the borough with the coal mining towns in the neighbourhood, there being about two dozen coal mines within a 10 mile radius. Agricultural trade is extensive, though coal working is the principal industry, and there are iron, brass, wagon, wire and agricultural machine works, toffee and chocolate works, wall paper works and a woolen mill. Adjoining the borough are the Saxon and Norman ruins of Conisbrough castle and the remains of the Norman Tickhill castle. The town contains free libraries, a museum and art gallery, six public parks and a municipal swimming bath.

History.—There was a Roman station here, and numerous remains of the Roman period have been found. In the reign of Edward the Confessor, Doncaster belonged to Earl Tostig, but before 1086 it had been granted to Robert, earl of Mortain, whose successor William was attainted for treason in the time of Henry I. The overlordship then fell to the crown, and the families of Fossard, Mauley and Salvin successively held the manor as underlords. Doncaster was evidently a borough held of the crown for a fee farm rent before 1194, when Richard I granted and confirmed to the burgesses their soke and town to hold by the ancient rent and by 25 marks yearly. The town was incorporated in 1467 by Edward IV. In 1623 Ralph Salvin tried to regain the manor of Doncaster from the mayor and burgesses who, fearing that the case would go against them, agreed to pay about £3,000, in return for which he gave up his claim. Charles II in 1664 gave the town a new charter, but since this was not enrolled, the burgesses obtained another charter from James II in 1684 by which the town was governed until the Municipal Corporation act. It was created a county borough in 1927. In 1200 a fair at Doncaster on the vigil and day of St James the Apostle was confirmed, and by the charter of 1194 the burgesses received licence to hold a fair on the vigil, feast and morrow of the Annunciation. These fairs were confirmed by Henry VII in 1505. The fairs and markets are still held under these charters.

DONDERS, FRANZ CORNELIUS (1818–1889), Dutch ophthalmologist, was born on May 27, 1818, in Tilburg, and studied at Utrecht where, after being an army surgeon, he became professor of physiology in 1847. From 1852 onwards he specialized in ophthalmology to which belong his studies of the *musculi voluntarii* (1847), the relation between convergence of visual axes and accommodation (1848), regeneration of the cornea

(1848), hypermetropia (1858), ametropia (1866), astigmatism (1862) His *The Anomalies of Refraction and Accommodation* was published in England in 1864. Donders died in Utrecht on March 24, 1889.

See E. Clarke, *A Brief Review of the Work of Donders* (1914).

DONEGAL, a county in the extreme north-west of Eire, bounded north and west by the Atlantic ocean, east by Lough Foyle and the counties Londonderry and Tyrone, and south by Donegal bay and the counties Fermanagh and Leitrim. The area is 1,865 sq mi. Pop. (1936) 142,310.

Geology—The rocks of the county are chiefly igneous or archæan and, structurally, it is a continuation of the Scottish Highlands, the same north-east-south-west structural lines dominating both, as a result, probably, of post Silurian ("Caledonian") earth movements. The archæan area usually forms the highest land, with quartzite standing out in white summits at Errigal (2,466 ft.) in the western or Derryvagh mountains, to the south of which is lower land towards Gweebarra bay, mostly formed by igneous rock which stretches north eastwards along a valley with long lakes, and separates the Derryveagh from the Glendown mountains, the latter again archæan. An important syncline of carboniferous sandstone and limestone forms the north-east shores of Donegal bay, and another one, or another part of the same one, forms the shores of Lough Foyle in Co. Londonderry and is continued south. Beyond the Donegal bay syncline, to the north-east, is a high igneous mass (Bluestack, 2,295 ft.). Much of the drainage is carried to the Foyle by the Derg and Finn rivers. Donegal includes the high Inishowen peninsula between Lough Swilly and Lough Foyle, formed mainly of archæan rocks (Slieve Snacht, 2,019 ft.), with some carboniferous along Lough Foyle. Lough Swilly is a marked feature, its upper part is related to the synclinal lines of Donegal bay and runs south-west north-east, its lower part turns out of this direction, and is a feature related to the unequal denudation of igneous and archæan rocks and the general coastal sinking which has contributed so much to the complexity of Donegal's coast line.

History—The greater part of Donegal was anciently called Tyrconnell (*q.v.*) or the country of Connal, and it was sometimes called O'Donnell's country, after the head chieftains of the district. This district was formed into the county of Donegal in the reign of Queen Elizabeth, in 1585, by the lord deputy, Sir John Perrot. At the head of Lough Swilly, on the summit of a hill 802 ft. high are some remains of a fortress or palace of the northern Irish kings. These are known as the Griann of Aileach and evidently date from a period prior to the 12th century. On Tory island there are one of the best specimens of a round tower and other remains. Numerous ruins of castles along the coast prove that much attention was formerly paid to the defence of the country from invasion. The principal are Kilbarrow castle, near Ballyshannon, Donegal castle and Burt castle. Traces of religious houses, some only in traditionary or documentary records, are numerous, the ruins of that of Donegal, founded in 1474, may still be seen. At Raphoe, 5 m. N.W. of Lifford, is the cathedral of a former diocese united to that of Derry in 1835.

Industries—The soil of the greater portion of the county, i.e., the granite, quartz and mica slate districts, is thin and cold, while that on the carboniferous limestone is warm and fertile. In most parts of the West the patches of glacial drift form the only agricultural land. Owing to the boggy nature of the soil, agriculture has not made much progress, although in certain districts (Gweedore, for instance) much land has been brought under cultivation through the enterprise of the proprietors. Wheat and barley are quite an inconsiderable crop, and in this, as well as in other respects, Donegal is much behind the rest of Ulster. It beats, however, a more favourable comparison as regards its live stock, as cattle, sheep and poultry are extensively kept.

The linen manufacture affords employment to a number of inhabitants, especially at Raphoe, while the manufacture of excellent homespun, woollen stockings and worked muslin is carried on fairly extensively. The trade in these manufactures and in the domestic produce of the county finds its principal outlets through the port of Londonderry and the inland town of Strabane Co.

Tyrone. The deep-sea fisheries are important and are centred at Killybegs, Gweedore and Rathmullen. The salmon fishery is also prosecuted to a considerable extent, the principal seats of the trade being at Ballyshannon and Letterkenny. Bog iron ore is mined as a gas-purifier, and the schist has been worked for slate at Croby Head. The fine-grained sandstone of Mt. Charles, near Donegal, is a well-known building stone, and the granites of the north-west have attracted much attention.

Most of the railway lines are owned jointly by the G.N. railway (Ireland) and the I.M.S. railway, and are controlled by the Co. Donegal joint committee. The chief branch leaves the Great Northern line from Londonderry to Omagh at Strabane. From Stranorlar one line follows the upper Finn valley and serves Glenties, whilst another line utilizes a gap to the south-west and communicates with Donegal. From here local lines serve the fishing villages and resorts around Donegal bay. Letterkenny is also connected with Strabane by rail. The county town is Lifford, practically a suburb of Strabane in Co. Tyrone. Other important towns are Letterkenny (2,049), Ballyshannon (2,223) and Bunratty (2,795). The Revision of Constituencies Act (1935) assigned to East Donegal four members and to West Donegal three members in Dail Eireann.

DONEGAL, a small seaport and market town of Co. Donegal, Eire, at the head of Donegal bay and the mouth of the river Eask. Pop. (1936) 1,315. There are ruins of a Jacobean castle (1610) on the site of a fortress of the O'Donnells of Tyrconnell, and of a Franciscan monastery (founded in 1474), at which were compiled the famous *Annals of the Four Masters*, a record of Irish history, completed in 1636. Donegal received a charter from James I. The name is said to allude to a settlement of the Northmen. Trade is hindered by shoals, which render difficult the approach to the harbour.

DONELSON, FORT, an entrenched camp at Dover, Tenn., U.S.A., erected by the Confederates in the Civil War to guard the lower Cumberland river, and taken by the Federals on Feb. 16, 1862. It consisted of two continuous lines of entrenchments on the land side, and water batteries commanding the river. After the capture (Feb. 6) of Fort Henry on the lower Tennessee the Union army under Brig. Gen. U. S. Grant moved to invest Donelson, two divisions marching overland while the third went by water, and the gunboat flotilla (Commodore A. H. Foote) descended the Tennessee and ascended the Cumberland to meet him. Albert Sidney Johnston, the Confederate commander in Kentucky, dividing his army, had retired himself to Nashville and had thrown a large garrison under Gen. Floyd into Donelson, and Grant was at first outnumbered, though continually reinforced, the latter had at no time more than three men to the Confederates' two. The troops of both sides were untrained but eager.

On Feb. 12 and 13, 1862, the Union divisions, skirmishing heavily during the second day, took up their positions investing the fort, and on the 14th Foote's gunboats attacked the water batteries. The latter received a severe repulse, Foote himself being amongst the wounded, and soon afterwards the Confederates determined to cut their way through Grant's lines. On the 15th Gen. Pillow attacked the Federal division of McClelland and drove it off the Nashville road, having done this, however, he halted, and even retired. Grant ordered Gen. C. F. Smith's division to assault a part of the lines which had been denuded of its defenders in order to reinforce Pillow. Smith personally led his young volunteers in the charge and carried all before him. The Confederates returning from the sortie were quite unable to shake his hold on the captured works, and, Grant having reinforced McClelland with Lew Wallace's division, these two generals reoccupied the lost position on the Nashville road. On the 16th, the two senior Confederate generals, Floyd and Pillow, having escaped by steamer, the infantry left in the fort under Gen. S. B. Buckner surrendered unconditionally. The Confederate cavalry under Col. Forrest made its escape by road. The prisoners numbered about 15,000 out of a total of 18,000.

See "Fort Donelson," *Military Historian and Economist*, vol. 1, p. 33-62 (Cambridge, Mass., 1916), and "Campaign Against Fort Henry and Donelson," *Coast Artillery Journal*, vol. lxxvi, p. 389-404 (Hampton, Va., 1927).

DONGA, a Bantu word for a narrow watercourse or eroded gully. Adopted by Europeans in S. Africa from the Kaffirs, it was applied to similar ravines, or watercourses elsewhere. It is almost equivalent to the Arabic *khur*, which also means the dry bed of a stream and to the Indian *nallah* (properly a watercourse).

DONGAN, THOMAS *see* LIMERIC, THOMAS DONGAN

DONGOLA, a district in the Northern province of the Anglo-Egyptian Sudan, lies wholly in the region formerly known as Nubia and extends along both banks of the Nile from about 18° N to 20° N. The rainfall is very slight, and the area of fertility is mainly confined to the lands watered by the Nile, and to the Wadi el Kab (Gab), west of and parallel to the Nile. Farther west is the extensive plateau of Jebel Abiad, and beyond, some 250 mi. due west of Debba is Bir Natrun, or Bir Sultran, a valley whence natron is obtained. In this desert region is found the arid, the rarest of Sudan antelopes. The principal market towns are Argo, Dongola and Kareima but the administrative headquarters are at Merowe (or Merawi) on the left bank of the Nile a few miles below the 4th cataract. Other towns of local importance are Khanda, Debba and Korti whence start caravan routes to Darfur, Kordofan and Omdurman. Old Merawi, on the right bank of the Nile, and Sanam Abu Dom, on the left bank, indicate the site of the Ethiopian city of Napata. From Kareima, on the right or northern bank of the Nile, 6 mi. above New Merawi, a railway (opened in March 1906) runs to join the main Sudan government line at Abu Hamed. From Kareima downstream the Nile is navigable to Kerma, just above the 3rd cataract.

The Dangiya are Nubians in type and language, but have a large admixture of Arab, Turk and other blood. They are great agriculturists and keen traders and were notorious slave dealers. Upstream from Korti the inhabitants are Shaigia (sons of Shaik) and the Nubian tongue is replaced by Arabic. Of the semi-nomadic tribes the chief are the Hawawir, Kabbabish and Gar rash.

History—Dongola was once part of the empire of Ethiopia (q.v.), Napata being one of its capital cities. From about the beginning of the Christian era the chief tribes were the Blemmyes and the Nobatae. The latter became converted to Christianity about the middle of the 6th century. A chieftain of the Nobatae, named Silko, before the close of that century, conquered the Blemmyes, founded a new state, made Christianity the official religion of the country, and fixed his capital at (Old) Dongola. This state, generally known as the Christian kingdom of Dongola, lasted for eight or nine hundred years. Christianity, after the wars of Silko, spread rapidly, and when the Arab conquerors of Egypt sought to subdue Nubia they met with stout resistance. Dongola, however, was captured by the Muslims in 652, and the country laid under tribute (*bakt*)—400 men having to be sent yearly to Egypt. This tribute was paid when it could be enforced, sometimes the Nubians gained the upper hand, as in 737 when their king Cyriacus, marched into Egypt to redress the grievances of the Copts. By the close of the 10th century the Nubians seem to have regained almost complete independence. They did not, however, possess any part of the Red Sea coast, which was held by the Egyptians, who, during the 9th and 10th centuries, worked the emerald and gold mines between the Nile and the Red Sea. The kingdom, according to the Armenian historian Abu Salih, was in a very flourishing condition in the 12th century. It then extended from Aswan southward to the 4th cataract, and contained several large cities. Gold and copper mines were worked. The liturgy used was in Greek. In 1173 Shams ed Daula, a brother of Saladin, attacked the Nubians and captured the city of Ibrim (Prims). The Egyptians retired, and for about 100 years the country was at peace. In 1275 the Mameluke sultan Bibars aided a rebel prince to oust his uncle from the throne of Nubia, the sultans Kalaun and Nasir also sent expeditions to Dongola which was several times captured. Though willing to pay tribute to the Muslims, the Nubians clung tenaciously to Christianity, and, despite Arab raids, the country appears during the 12th and 13th centuries to have been fairly prosperous. It is not certain how far south the authority of the Dongola kingdom (sometimes known as Mukura) extended.

Another Christian state, Aloa (Alwa), with its capital Soba on the Blue Nile, was its near neighbour on the south.

Cut off from free intercourse with the Copts in Egypt, the Nubian Christians at length began to embrace Jewish and Mohammedan doctrines. The decay of the state was hastened by dissensions between Mukarra and Aloa, but the Nubians were strong enough to invade upper Egypt during the reign of Nawayya Krestos (1342-72), because the governor of Cairo had imprisoned the patriarch of Alexandria. The date usually assigned for the overthrow of the Christian kingdom is 1351. Only the northern part of the country (35 far as the 3rd cataract) came under the rule of Egypt. Nevertheless, according to Leo Africanus, at the close of the 15th century Christianity and native states still survived in Nubia, and in the 16th century the Nubians sent messengers to Abyssinia to Father Alvarez, begging him to appoint priests to administer the sacraments to them—a request he was unable to grant. Thereafter the Nubian Church is without records. The region between Dongola and Shendi appeared to have been depopulated. In the north the Turks introduced in the 16th century numbers of Bosnians, whose descendants ruled the district, paying a nominal allegiance to the Porte. At Ibrim Mahass, and elsewhere along the banks and on the islands of the Nile, they built castles, now in ruins. South of Hannek the kings of Sennar became overlords of the country. As the power of the Sennari declined, the Shaigia (or Shaikiyah) attained pre-eminence in the Dongola district.

About 1812 Mamelukes fleeing from Mohammed Ali, the pasha of Egypt, made themselves masters of part of the country, destroying the old capital and building a new one lower down the Nile. In 1820 both Mamelukes and Shaigia were conquered by the Egyptians, and the Dongola province annexed to Egypt.

After the failure of the British relief expedition of 1884-85 and the Mahdist capture of Khartum it was decided to withdraw to the region of the 2nd cataract, and the Dongola province was evacuated. The British vanguard left Dongola town in June 1885 and the Mahdists occupied it at the end of August. They held the province for 11 years, during which its northern villages were depopulated and their riverside lands laid waste. It was reoccupied by Kitchener's forces in 1896, Dongola being recaptured on Sept. 23. It remained a province of the Anglo-Egyptian Sudan until 1936 when it was incorporated as a district in the Northern province. Its principal product is dates obtained from approximately 1,000,000 date trees.

(L. M. B. X.)

DONGOLA, a town of the Anglo-Egyptian Sudan, which gives its name to a district. It is situated on the west bank of the Nile, about 45 mi. above the third cataract, in 19° 10' N, 30° 29' E. It is 1,082 mi. S of Cairo by river and 638 mi. N of Khartum by the same route. It is a small, mud built market town, the headquarters of the Rural District council. Lignite is found on the east bank of the Nile opposite the town. Founded c. 1812 by Mamelukes who fled to Nubia from the persecutions of Mohammed Ali, the town is called Dongola Ordi (Dongola Camp) to distinguish it from Dongola Agusa (Old Dongola), which it supplanted. The Mahdi Mohammed Ahmed was a native of Dongola. In 1884-1885 the town was the base of the British troops in their advance on Khartum.

Dongola Agusa, 75 mi. upstream from New Dongola, now a heap of ruins, was the capital of the Nubian state usually called the Christian kingdom of Dongola. An Arab historian of the 11th century describes it as a large city with many churches, fine houses and wide streets. It is said to have been finally destroyed by the Mamelukes.

DONIZETTI, GAETANO (1797-1848), Italian musical composer, was born at Bergamo on Nov. 29, 1797. He studied at Naples under Simon Mayr, the operatic composer, and then under Mattei at Bologna. After his return to Bergamo, his father

insisted upon his giving lessons in order to earn his living. Donzetti revolted and enlisted in the army. His regiment was quartered at Venice, and here the young composer's first opera, *Enrico conte di Borgogna*, saw the light in 1818.

The success of this work, and of a second opera brought out in the following year, established Donzetti's reputation. He obtained his discharge from the army, and henceforth his operas followed each other in rapid and uninterrupted succession at the rate of three or four a year. Although he had to contend successively with two such dangerous rivals as Rossini and Bellini, he succeeded in taking firm hold of the public, and the brilliant reception accorded to his *Azucena* at Milan, where Pasta and Rubini appeared in it, earned his name beyond the limits of his own country. In 1835 Donzetti went for the first time to Paris, where, however, his *Marmora Fubero* failed to hold its own against Bellini's *Puritani*, then recently produced at the Théâtre Italien. The disappointed composer went to Naples, where the enormous success of his *Lucia di Lammermoor* (1835) consoling him for his failure in Paris. Returning to Paris he produced at the Opéra Comique what proved eventually his most popular opera, *La Fille du régiment*, but it was not till after the work had made the round of the theatres of Germany and Italy that it found favour with the French. A revival in Paris of his *Lucrezia Borgia*, produced at Milan in 1833, was interrupted by Victor Hugo's claim for infringement of copyright, and the libretto was altered. *La Favorita*, generally considered Donzetti's masterpiece, was produced in 1840. His next important work, *Linda di Chamounix*, was written for Vienna, where it was received most favourably in 1842, and the same success attended the production of *Don Pasquale* in Paris in 1843. Soon after this event the first signs of a fatal disease, caused to a great extent by overwork, began to show themselves. The utter failure of *Don Sebastian*, a large opera produced soon after *Don Pasquale*, is said to have hastened the catastrophe. A paralytic stroke in 1844 deprived Donzetti of his reason, and for four years he lingered on in a state of mental and physical prostration. A visit to his country was proposed as a last resource, but he reached his native place only to die there on April 1, 1848.

The sum total of his operas amounts to sixty-four. The large number of his works accounts for many of their chief defects. His rapidity of working made all revision impossible. It is said that he once wrote the instrumentation of a whole opera within thirty hours. And yet it may be doubted whether more elaboration would have essentially improved his work, for the dramatic last act of the *Favorita*, infinitely superior to the preceding ones, is also said to have been the product of a single night.

Without boasting the sweetness of Bellini or the sparkle of Rossini, Donzetti won the popular ear by his flow of melody and by his rare skill in writing for the voice, to which qualities may be added his power of humorous delineation, as evinced in *Don Pasquale* and *L'Elisir d'amore*, which works will probably last as long as anything he ever wrote.

See F. Cicconetti, *Vita di G. Donzetti* (1864); *Lettres inédites de Gaetano Donzetti* (ed. Essner-Eschenhoff, 1897); Ch. Malherbe, *Le centenaire de Donzetti* (1897); and A. Cametti, *Donzetti* (1907).

DONJON, the French term for the keep (*q v*), the prison, an anglicized spelling of the same word.

DON JUAN, a legendary character, whose story has found currency in various European countries. He was introduced into formal literature in the Spanish *El Burlador de Sevilla y convidado de piedra*, a play which was first printed at Barcelona in 1630, and is usually attributed to Tirso de Molina, but the story of a profligate inviting a dead man to supper, and finding his invitation accepted, was current before 1630, and is not peculiar to Spain. The available evidence goes to show that Don Juan is a universal type, the subject of local myths in many countries, that he received his name in Spain, and that the Spanish version of his legend has absorbed certain elements from the French story of Robert the Devil. The character of Don Juan as the incarnation of perverse sensuality and arrogant blasphemy, has been considered as the creation of the author of *El Burlador*. The drama

was apparently more popular in Italy than in Spain, and was frequently given in pantomime by Italian actors, a company of whom took the story into France in 1657. It was dramatized by Dommond in 1659 and by De Villiers in 1661, their attempts suggested *Le Festin de Pierre* (1665) to Molière, who substituted prose for verse, reduced the supernatural element, and interposed new comic effects. The story was introduced into England by Sir Aston Cokain in his unreadable *Tragedy of Ovid* (1669), and was the theme of *The Libertine* (1676) by Shadwell. *El Burlador* was recast, but not improved, by Antonio de Zamora early in the 18th century, and a hundred years later the character was endowed with a new name in Espronceda's *Estudiante de Salamanca*. But the most curious resurrection of the type in Spain is the protagonist in Zorrilla's *Don Juan Tenorio*, which is usually played in all large cities during the first week in November, and his name to be regarded as an essentially national work. It is in fact little more than an adaptation of the elder Dumas' *Don Juan de Marano*, which, in its turn, derives chiefly from Mérimée's novel, *Les Ames du Purgatoire*. Byron's *Don Juan* resembles Ullúa's murderer in nothing but his name.

The sustained popularity of the Don Juan legend is undoubtedly due in great measure to Mozart's incomparable setting of Da Ponte's mediocre libretto. In this pale version of *El Burlador de Sevilla* the French romantic school made acquaintance with Don Juan, and hence, no doubt, the works of Mérimée and Dumas already mentioned, Balzac's *Elisir d'une longue vie*, and Alfred de Musset's *Un Mame de Don Juan* and *Namouna*. The legend has been treated subsequently by Flaubert and Barbey d'Aurevilly in France, by Landau and Heyse in Germany, by Sachse Masoch in Austria and in a highly modernized form by G. B. Shaw (*Man and Superman*). It has always fascinated composers. Mozart's *Don Giovanni* has annihilated the earlier operas of Le Tellier, Righini, Tritto, Gardi and Gazzaniga, but Gluck's ballet music still survives, and Henry Purcell's setting—the oldest of all—has saved some of Shadwell's insipid lyrics from oblivion.

Farnelli, *Quattro capolavori del Don Juan y la literatura donjuanesca del porvenir in the Homage to Méridès y Pelayo* (Madrid, 1899), vol. 1, pp. 205-22.

DONKEY

DONKEY-ENGINE. A steam engine of small or moderate power which works a crane or hoist, chiefly on board ship, to handle cargo and luggage. The steam is supplied by a donkey-boiler instead of being taken from the main boilers. A donkey pump is of very compact design, and suitable for being bolted to a ship's side, a column or wall, or a boiler. It is used for feeding boilers, tanks, vats, etc., and works by the direct action of a steam driven piston on a plunger in the pump cylinder. A fly-wheel helps to maintain a steady action of the pump. The smallest pumps, of the type shown (see p. 530), deliver about 50 gal. per hour, and the largest 4,000.

DONKIN, SIR ROBERT SHAW (1773-1841), British soldier, son of Rufus Donkin (d. 1821), joined the army at the age of 14. He was divisional commander in Hastings' operations against the Maráthas (1817-18), receiving the K.C.B. as his reward. From 1820 to 1821 he administered the Cape of Good Hope with success, and named the rising seaport of Algoa bay Port Elizabeth in memory of his wife. In 1831 he became lieutenant-general and G.C.B.

See Jordan, *National Portraits*, vol. 11; *Genikman's Magazine*, vol. 1, 273.

DONNAY, CHARLES MAURICE (1859-1945), French dramatist, was born of middle class parents in Paris in 1859. He made his serious debut as a dramatist on the little stage of the Chat Noir with *Phryne* (1891), a series of Greek scenes *Lysistrata*, a four-act comedy, was produced at the Grand Théâtre in 1892 with Mme Réjane in the title part. Later plays include *Folle Entreprise* (1894), *Pension de famille* (1894), *Amants* (1895), produced at the Renaissance theatre with Mme Jeanne Granier as Claudine Rozery, *La Donlovenne* (1897), *L'Afranchie* (1898), *Georgette Lemoine* (1898), *Le Torrent* (1899), at the Comédie Française, *Éducation de prince* (1900), and *Oseux*

de passées (1904), in collaboration with L. Descaves, *La Bascule* (1901) *L'Autre danger*, at the *Comédie Française* (1902), *Le Retour de Jérusalem* (1903), *L'escalade* (1904), and *Paraitre* (1906). With *Amants* he won a great success, and the play was hailed by Jules Lemaître as the *Bernice* of contemporary French drama. The whole series of plays reflects the various questions agitating society at the time, and the witty dialogue is written

DIAGRAM OF A DONKEY PUMP. THE PUMP RAM IS WORKED DIRECT BY THE PISTON ROD OF THE STEAM CYLINDER AND THE FLYWHEEL PROVIDES A STEADY ACTION (SEE P. 529)

with an apparent carelessness that approximates closely to the language of every day. Donny died in Paris, March 31 1945.

DONNE, JOHN (1573-1631), English poet and divine of the reigns of James I, and Charles I, was born in 1573 in the parish St Nicholas Olave, in the city of London. His father was a wealthy merchant, who next year became warden of the Company of Ironmongers, but died early in 1576. Donne's parents were Catholics, and his mother, Elizabeth Heywood, was directly descended from the sister of the great Sir Thomas More, she was the daughter of John Heywood the epigrammatist. As a child, Donne's precocity was such that it was said of him that "this age hath brought forth another Pico della Mirandola." He entered Hart Hall, Oxford, Oct 1584, and left it in 1587, proceeding, according to Walton, to Cambridge, where he remained three years. At Oxford began his friendship with Henry Wotton, and at Cambridge, probably, with Christopher Brooke. Donne was "removed to London" about 1590 and in 1592 he entered Lincoln's Inn with the intention of studying the law.

When he came of age, he found himself in possession of a considerable fortune, and about the same time rejected the Catholic doctrine in favour of the Anglican communion. He began to produce *Satires*, which were not printed, but eagerly passed from hand to hand, the first three are known to belong to 1593, the fourth to 1594, while the other three are probably some years later. In 1596 Donne engaged himself for foreign service under the earl of Essex, and "waited upon his lordship"

on board the "Repulse," in the magnificent victory of the 11th of June. We possess several poems written by Donne during this expedition, and during the Islands Voyage of 1597, in which he accompanied Essex to the Azores. According to Walton, Donne spent some time in Italy and Spain, and intended to proceed to Palestine, "but at his being in the farthest parts of Italy, the disappointment of company, or of a wife convict of the uncertainty of returns of money into those remote parts, damped him that happiness." There is some reason to suppose that he was on the Continent at intervals between 1595 and the winter of 1597. His lyrical poetry was mainly the result of these years, if we are to believe Ben Jonson, who told Drummond of Hawthornden that Donne "wrote all his best pieces ere he was 25 years old." At his return to England he became private secretary to Sir Thomas Egerton, the lord keeper (afterwards Lord Chancellor Ellesmere) in whose family he remained four years. In 1600 he found himself in love with his master's niece, Anne Mole, whom he married secretly in Dec 1601. As soon as this act was discovered, Donne was dismissed, and then thrown into the Fleet prison (Feb 1602), from which he was soon released. His circumstances, however, were now very much straitened. His own fortune had all been spent and "troubles did still multiply upon him." Mrs Donne's cousin, Sir Francis Wootley, offered the young couple an asylum at his country house of Pyrford, where they resided until the end of 1604.

During the latter part of his residence in Sir Thomas Egerton's house, Donne had composed the longest of his existing poems, *Of the Progress of the Soul*, not published until 1633. In the spring of 1605 we find the Donnes living at Camberwell, and a little later in a small house at Mitcham. He had by this time "acquired such a perfection" in civil and common law that he was able to take up professional work, and he now acted as a helper to Thomas Morton in his controversies with the Catholics. Donne is believed to have had a considerable share in writing the pamphlets against the papists which Morton issued between 1604 and 1607. In the latter year, Morton offered the poet certain preferment in the Church, if he would only consent to take holy orders. Donne, however, although he was at this time become deeply serious on religious matters, did not think himself fitted for the clerical life. It is probable that many, perhaps most, of his religious poems and most notably the *Holy Sonnets*, belong to the period from about 1607 to 1612, which was one of mental conflict for Donne. These exercises were not of a nature to add to his income, which was extremely small. His uncomfortable little house he speaks of as his "hospital" and his "prison", his wife's health was broken and he was bowed down by the number of his children, who often lacked even clothes and food. In the autumn of 1608, his father-in-law, Sir George More, became reconciled with them, and agreed to make them a generous allowance. Donne soon after formed part of the brilliant assemblage which Lucy, countess of Bedford, gathered around her at Twickenham, we possess several of the verse epistles he addressed to this lady. In 1609 Donne was engaged in composing his great controversial prose treatise, *Pseudo-Martyr*, printed in 1610, this was an attempt to convince Roman Catholics in England that they might, without any inconsistency, take the oath of allegiance to James I. In 1611 Donne wrote a curious and bitter prose squib against the Jesuits, entitled *Conclave Ignati*. To the period between 1603 and 1609, belongs the apology for the principle of suicide, which was not published until 1644, long after Donne's death. This work, *Bathanatos*, is an attempt to show that "the scandalous disease of headlong dying," to which Donne himself in his unhappy moods had "often such a sickly inclination," was not necessarily and essentially sinful.

In 1610 Donne formed the acquaintance of Sir Robert Drury of Hawsted, who offered him and his wife an apartment in his large house in Drury lane. Drury lost his only daughter in 1611. Donne published anonymously an extravagant elegy on her in two volumes, *Anniversaries*, separately entitled *The First Anniversary, An Anatomy of the World*, to which he added in 1612 *The Second Anniversary, of the Progress of the Soul*, he threatened to celebrate the "blessed Maid," Elizabeth

Drury, in a fresh elegy on each anniversary of her death, but he happily refrained from the third occasion onwards. At the close of 1611 Sir Robert Drury determined to visit Paris (but not, as Walton supposed, on an embassy of any kind), and he took Donne with him. When he left London, his wife was expecting an eighth child. It seems almost certain that his fear to have him absent led him to compose one of his loveliest poems

Sweetest Love, I do not go
For weariness of thee

He is said to have had a vision, while he was at Amiens, of his wife, with her hair over her shoulders, bearing a dead child in her arms, on the very night that Mrs. Donne, in London (or more probably in the Isle of Wight), was delivered of a still-born infant. He suffered, accordingly, a great anxiety, which was not removed until he reached Paris, where he received reassuring accounts of his wife's health. The Drurys and Donne left Paris for Spa in May 1612, and travelled in the Low Countries and Germany until September, when they returned to London. In 1613 Donne contributed to the *Lachrymae lachrymarum* of Sylvester an obscure and frigid elegy on the death of the prince of Wales, and wrote his famous Marriage Song for St. Valentine's Day to celebrate the nuptials of the elector palatine with the princess Elizabeth. About this time Donne became intimate with Robert Ker, then Viscount Rochester and afterwards the infamous earl of Somerset, from whom he had hopes of preferment at court. Donne was now in weak health, and in a highly neurotic condition. It is probable that at this time he went through a spiritual crisis which, after many misgivings on his part, ended in a determination to enter the ministry—a course which some of his friends had been urging him to adopt for no little time. At the close of 1614 the king sent for Donne to Theobalds, and "descended to a persuasion, almost to a solicitation of him, to enter into sacred orders," but Donne asked for a few days to consider. Finally, early in 1615, King, bishop of London, "proceeded with all convenient speed to ordain him, first deacon, then priest." He was, perhaps a curate first at Paddington, and presently was appointed royal chaplain.

His earliest sermon before the king at Whitehall carried his audience "to heaven, in holy raptures." In April, not without much bad grace, the University of Cambridge consented to make the new divine a D.D. In the spring of 1616, Donne was presented to the living of Keynton, in Hunts, and a little later he became rector of Sevenoaks, the latter preferment he held until his death. In October he was appointed reader in divinity to the benchers of Lincoln's Inn. His anxieties about money now ceased, but in Aug. 1617 his wife died, leaving seven young children in his charge. Perhaps in consequence of his bereavement, Donne seems to have been inspired with a peculiar fervour of devotion. His fame as a preacher, so well and nobly described by Isaac Walton in his *Life*, spread. Of the very numerous sermons preached by Donne at Lincoln's Inn, 14 have survived. His health suffered from the austerity of his life, and it was probably in connection with this fact that he allowed himself to be persuaded in May 1619 to accompany Lord Doncaster as his chaplain on an embassy to Germany. Having visited Heidelberg, Frankfurt and other German cities, the embassy returned to England at the beginning of 1620.

In Nov. 1621, James I., knowing that London was "a dash" which Donne "loved well," "carved" for him the deanery of St. Paul's. He resigned Keynton, and his preacher'ship in Lincoln's Inn (Feb. 1622). In Oct. 1623 he suffered from a dangerous attack of illness, and during a long convalescence wrote his *Devotions*, a volume published in 1624. He was now appointed to the vicarage of St. Dunstan's in the West. In April 1625 Donne preached before the new king, Charles I., a sermon which was immediately printed, and he now published his *Four Sermons upon Special Occasions*, the earliest collection of his discourses. When the plague broke out he retired with his children to the house of Sir John Danvers in Chelsea, and for a time he disappeared so completely that a rumour arose that he was dead. Sir John had married Donne's old friend, Mrs. Magdalen Herbert for whom Donne wrote two of his most ingenious poems, "The

Primrose" and "The Autumnal." The popularity of Donne as a preacher rose to its zenith when he returned to his pulpit, and it continued there until his death. Walton, who seems to have known him first in 1624, now became an intimate and adoring friend. In 1630 Donne's health, always feeble, broke down completely, so that, although in August of that year he was to have been made a bishop, the entire collapse of his health made it worse than useless to promote him. The greater part of that winter he spent at Abury Hatch, in Epping Forest, with his widowed daughter Constance Allyn, and was too ill to preach before the king at Christmas. It is believed that his disease was a malarial form of recurrent quinsy acting upon an extremely neurotic system. He came back to London, and was able to preach at Whitehall on Feb. 12, 1631. This, his latest sermon, was published, soon after his demise, as *Death's Duel*. He now stood for his statue to the sculptor, Nicholas Stone, standing before a fire in his study at the deanery, with his winding-sheet wrapped and tied round him, his eyes shut, and his feet resting on a funeral urn. This lugubrious work of art was set up in white marble after his death in St. Paul's cathedral, where it may still be seen. Donne died on March 31, 1631, after he had lain "15 days earnestly expecting his hourly change." His aged mother, who had lived in the deanery, survived him, dying in 1632.

Donne's poems were first collected in 1633, and afterwards in 1635, 1639, 1640, 1650, 1654 and 1669. Of his prose works, *Pseudomartyr* appeared in 1610, *Ignatius*, both in Latin and in English, in 1611, the *Devotions*, in 1624, the *Juvenilia* in 1633, the *LXXX Sermons* in 1640, *Biathanatos* in 1644, *Fifty Sermons* in 1649, *Essays in Divinity* 1651, his *Letters to Several Persons of Honour*, 1651, *Paradoxes, Problems and Essays* (a reprint of *Ignatius* and the *Juvenilia* with some new, and some spurious, matter), 1652, and *Six and Twenty Sermons*, 1661. Isaac Walton's *Life of Donne*, an admirably written but not entirely correct biography, preceded the *Sermons* of 1640. The principal editor of his posthumous writings was his son, John Donne the younger (1604-62), a man of eccentric and scandalous character, but of considerable talent.

The influence of Donne upon the literature of England was singularly wide and deep, although almost wholly malign. His originality and the fervour of his imaginative passion made him extremely attractive to the younger generation of poets, who saw that he had broken through the old tradition, and were ready to follow him implicitly into new fields. In the 18th century his reputation almost disappeared, to return, with many vicissitudes in the course of the 19th. The first impression of an unbiased reader who dips into the poems of Donne is unfavourable. He is repulsed by the intolerably harsh and crabbed versification, by the recondite choice of theme and expression, and by the oddity of the thought. In time, however, he perceives that behind the fantastic garb of language there is an earnest and vigorous mind, an imagination that harbours fire within its cloudy folds, and an insight into the mysteries of spiritual life which is often startling. Donne excels in brief flashes of wit and beauty, and in sudden daring phrases that have the full perfume of poetry in them. Some of his lyrics and one or two of his elegies excepted, the *Satires* are his most important contribution to literature. They are probably the earliest poems of their kind in the language, and they are full of force and picturesqueness. Their obscure and knotty language only serves to give peculiar brilliancy to the not uncommon passages of noble perspicacity.

BIBLIOGRAPHY.—Isaac Walton's *Life*, first published in 1640, and entirely recast in 1658, has been constantly reprinted. Donne's prose works have not been collected. In 1899 Edmund Gosse published in two volumes *The Life and Letters of John Donne*, for the first time revised and collected. The standard edition of *Donne's Poems* is that published in two volumes, by Professor Herbert J. C. Grierson (Oxford 1930), *A Study of Donne's Prose Works* by Evelyn M. Simpson (Oxford 1924) deals with the rest of his work and prints new letters. A full *Bibliography* by G. L. Keynes was published at the Cambridge Press in 1925.

DONNER, RAPHAEL GEORG (1603-1742), Austrian sculptor, born on May 24, 1693, at Esslingen in Lower Austria, went to Heiligenkreuz intending to take holy orders, but he was there encouraged to follow his artistic bent by the sculptor Gail-

iano, and, after working in his studio, entered the Vienna academy. His fine work brought him to the notice of the court and he found employment in Salzburg for some years, afterwards returning to Vienna, where he died on Feb. 15, 1741. His masterpiece is the fountain on the Neumarkt in Vienna, which he executed in the years 1738 and 1739. The figures originally cast in lead, a technique favoured by the artist, were replaced by exact copies in bronze in 1873. Other works are the fountain with Perseus and Andromeda in the courtyard of the Vienna Rathaus and a statue of Charles VI in the Belvedere, Vienna. Donner's refined plastic form and clear outline contrasted with the art of his contemporaries and predecessors, who tended towards exaggerating the restlessness of Bernini's baroque style, and influenced his followers to adopt a more classic conception of form.

DONNYBROOK, part of Dublin, Eire. The former village of the name was famous for a fair held under licence from King John in 1204, but discontinued in 1855.

DONO, PAOLO DI (see UCCELLO, PAOLO)

DONORA, a borough of Washington county, Pa., U.S.A., on the Monongahela river and the Pennsylvania railroad, 20 mi S by E of Pittsburgh. The population in 1950 was 11,831, in 1940 it was 13,780 and in 1930, 13,995 by the federal census. It is an important manufacturing centre of the Pittsburgh district, producing steel, nails, wire, zinc and chemicals.

DONOSO CORTES, JUAN, marquis de Valdegamas (1809–1853), Spanish author and diplomatist. After entering politics as an advanced liberal, he made a complete volte face after 1843, and in his *Ensayo sobre el catolicismo, el liberalismo y el socialismo, considerados en sus principios fundamentales* (1851), denounced reason as the enemy of truth and liberalism as leading to social ruin. With all its rhetorical excesses, the *Ensayo* remains one of the finest specimens of impassioned prose published in Spain during the 19th century.

DOOM, originally a law or enactment, the legal decision of a judge, and particularly an adverse sentence on a criminal (O.E. *dōm*, a word common to Teut. languages for that which is set up or ordered). The word is thus applicable to the adverse decrees of Fate, and particularly to the day of judgment. The verb "deem," to deliver a judgment, is seen in "deemster," the name of the two judges of the Isle of Man (*q.v.*).

DOON DE MAYENCE, a hero of romance, who gives his name to the third cycle of the Charlemagne romances, those dealing with the feudal revolts. There is no real unity in the *geste* of Doon de Mayence. The rebellious barons are connected by the *trouvères* with Doon by imaginary genealogical ties, and all are represented as in opposition to Charlemagne, though their adventures, in so far as they possess a historical basis, must generally be referred to earlier or later periods. The general insolence of their attitude to the sovereign suggests that Charlemagne is here only a name for his weaker successors. The tradition of a traitorous family of Mayence, which was developed in Italy into a series of stories of criminals, was, however, anterior to the Carolingian cycle, for an interpolator in the chronicle of Frédégarus states (*iv. 87*) that the army of Sigebert was betrayed from within its own ranks by men of Mayence in a battle fought with Rudolf on the banks of the Unstrut in Thuringia. The chief heroes of the poems which make up the *geste* of Doon de Mayence are Ogier the Dane (*q.v.*), the four sons of Aymon (*see* *RENAUD DE MONTAUBAN*), and Huon of Bordeaux (*q.v.*). It is probable that Doon was one of the last personages to be clearly defined, and that the *chanson de geste* relating his exploits was drawn up partly with the view of supplying a suitable ancestor for the other heroes. The latter half of the poem, the story of Doon's war in Saxony, is perhaps based on historical events, but the earlier half is obviously pure fiction and dates from the 13th century.

See *First list of la France*, vols. 1221 and 1222 (1851 and 1873), for analyses of these poems by Paulin Paris, also J. Barrois, *Le roman de Doon de Mayence* (1839), W. Nückel, *Die Dichtung des Helden der alten Doon* (Graz, 1924), 1890. The prose romance *La Fleur des batailles Doon de Mayence*, was printed by Antoine Verdard (1901), by Alain Lotin and Louis Jannot (*l. 1910*), by N. Benoit (*no date*), by I. W. Bague (*1924*), etc. The chief poems of the cycle are available in the series of *Anciens Poésies de la France* (1859, etc.)

DOOR, a single piece, or assemblage of pieces, of wood, metal, stone or other material, supported movably in an opening, so as to allow or prevent passage through that opening. In door openings of primitive huts sheets of hide or textiles were hung as doors. These were either hung as flaps or else arranged to roll up. In the tomb of Ti, in Egypt, of the 5th dynasty, there are elaborate wall painting representations of doors of richly decorated matting which were rolled up to the top, like an awning to admit entrance, and in certain Italian churches to the present day similar flaps of leather are used as secondary doors. Doors of more rigid materials came into use early and consisted, apparently, of single heavy wooden boards, with pivots at the top and bottom of one side, fitted into sockets in the sill and head. This seems to have been the common practice in Egypt, when the doorway was wide, two such doors were used, pivoted on opposite sides.

In countries where wood was scarce, stone doors were used. This is notably the case in Syria, where many stone doors dating from the 4th to the 6th century have been found. Similar doors of stone or marble were frequent in tombs. There is a famous marble door from a tomb in Pompeii, probably of the Augustan era. These stone doors were always pinned, very likely to lessen the weight without reducing the strength.

In countries with damp climates, where single pieces of wood would warp, wooden doors are built up of several pieces, either by forming them of a series of vertical planks, tied together by tenons, dowels or horizontal braces known as battens, or else by forming a framework of uprights called stiles, and horizontal members called rails, with thinner panels placed between them and held in by grooves or additional mouldings. In Syria, Palestine and Mesopotamia wooden doors were frequently sheathed in sheets of metal richly repoussé. In the British Museum there are numerous examples and battle scenes and also the bronze pivots from the gates at Balawat (895–825 B.C.). These gates were of two leaves, each about 8 ft. 4 in. wide and 27 ft. high, and the bands which decorated them are from high Solomon's temple is described (I Kings vi) as having doors of carved wood covered with gold leaf.

Classic doors were usually of wood, panelled. Representations in Pompeian wall paintings and contemporary reliefs show that they greatly resembled the doors of the present day, and a plaster cast of an original charred door confirms this. These ancient doors seem to have been frequently in two, three or four leaves, and hinges connecting the leaves of such a door have been found. The doors for monumental buildings were largely of bronze (*see* *BRONZE*) and the beautifully designed example in the Pantheon (A.D. 110–125) is famous. Several similar Roman examples remain, especially those of the basilica of SS Cosmas and Damian, in Rome, taken from an earlier building dating from the best Roman imperial period, and those of the Lateran basilica. The most important Byzantine examples extant are those of S. Sophia, Constantinople. They are heavily panelled with deep mouldings and further enriched by rows of rosettes and decorative bolt heads. The influence of Roman precedent is obvious in the design. Many Romanesque bronze doors exist in south Italy. In these the panels are small, shallow and usually square. The richness is obtained through low relief that is sometimes scarcely more than engraving. The finest examples are those at Amalfi (1060), two at Troia (1110 and 1124), that at Ravenna (1170) and the doors of Trani cathedral (late 12th century).

Like in the 12th century the pivoting of the doors at top and bottom gave way, generally, to the use of hinges, this change offered great opportunities for door decoration which was represented in most of the important Gothic cathedrals. Here the doors are usually simple plank doors of wood, the decoration consisting of the elaborate wrought iron hinge plates (*see* *IRON 17 ART*) hammered into intricate foliated scrolls, occasionally, as in the famous doors of Notre Dame at Paris (early 13th century), additional cross braces of similar foliated wrought iron are introduced among the three hinges. In the late Gothic period this usage died out. Decoration was obtained in the wood of the door itself by forming the panels with tracery, occasionally very

intricately, and sometimes adding miniature buttresses and carved figures. In the smaller doors the use of the linen fold (simulating folded cloth) decoration is common. With the coming of the early Renaissance a similar kind of decoration was carried out with even greater richness, and wooden doors, in which panels crowded with figures, buttresses, simulated architectural forms and decorated mouldings give an impression of extraordinary richness are characteristic. e.g., the doors of S. Maclou at Rouen, by Jean Goujon, 1540. The later Renaissance returned to more classic and simple forms. Typical are the bronze doors of the Baptistery at Florence designed by Ghiberti (1403-52). Although in the north doors he followed the Gothic scheme of Andrea Pisano's south door, in the east, despite the complexity and beauty of the figure decoration, the scheme is rigidly rectangular. The use of rectangular or square panels remained constant throughout the Italian Renaissance, but in France, from the time of Henry IV on, doors became more and more fantastic, culminating in those of the time of Louis XIV and Louis XV, with their curved heaped panels and double or triple mouldings.

In Muslim doors the enormous skill in elaborate wood framing possessed by Mohammedan carpenters finds congenial expression and the most intricate panelled types, with star shaped and polygonal panels, are common. Frequently additional decoration is given by complicated pierced and cut out metal mountings, some of which are used to ornament the corners of the temple doors of China and Japan. These doors are usually of two panels, the lower solid, the upper filled with elaborate grill work in wood, either based on hexagonal patterns and triangles or an intricate network of straight lines of varying angles and lengths, over which paper is pasted in lieu of glass. In Japanese houses doors are usually sliding and may have the same pattern as the walls.

Modern wooden doors continue the traditional panel type. In construction, however, solid doors are more and more giving place to those in which a core of small pieces of soft wood is covered by sheets of veneers, enabling the occasional abandonment of panel and the making of flush doors which are commonly used in hospitals. Another characteristic modern development has been the tremendous increase in the number and variety of metal doors in connection with fire proof construction. These are of two types: metal covered or kalamein, in which a core of wood is covered with metal sheets, carefully soldered and locked together, and hollow metal, in which a frame of structural metal sections is encased with metal plates. In both of these types, for structural reasons, the panel design is usually perpetuated, but flush pattern hollow metal doors are becoming more and more common. The use of top and bottom pivots instead of hinges is frequent in exterior doors, particularly where there are several doors in a row, in order to avoid vertical bars or mullions between them. Elaborate mechanical development of all types of locks, hinges, pivots, door checks and door closers is noteworthy. (See DOORWAY.)

(T F H)

DOORWAY, in architecture, the entrance of a building, room or enclosure, especially the framing of such an opening. In primitive construction with brick or rubble, opening frames were usually of wood, and consisted of uprights or jambs on each side, and lintels or heads at the top. Such doorways occurred in the archaic work in Greece, and evidences of wooden frames exist in Mycenaean from about the 13th century B.C. and in the Heraeum at Olympia, where the early, crude arrangement was preserved all through. In wooden framed buildings the lintel is usually framed between the uprights which continue up beyond it. Examples of this arrangement are represented in certain Egyptian mastaba tombs of the second, third and fourth dynasties. Where building is all in cut stone, no separate door frame is necessary, but decorative lines are, nevertheless, frequently carried around the opening, as a legacy from other and earlier types of building.

In Egyptian work, although the doorway jambs are not indicated, and the banding of the cut stone wall is frequently carried, unbroken, straight to the opening, the head was expressed by means of a projecting cornice. This cornice was of the usual *cavetto* or concave type, and often carried a decoration in the centre, formed of the winged globe symbolizing the sun. In some

of the doorways in the stone screen walls of later Egyptian temples it was necessary for the door opening to be carried up higher than the height of the screen, to allow banners and the sacred boats to be carried through in processions. In order to accomplish this and still preserve the doorway form, the head was not complete and was formed merely by stones with small projections inward from the jambs, ornamented, however, like the complete lintels, as in the famous Ptolemaic temple at Edfu (237 to 57 B.C.).

In archaic Etruria as well as in Greece doorways were frequently smaller at the top than at the bottom, in order to lessen the length of the lintel, and apparently in both countries, at nearly the same time, the idea occurred of decorating the jambs and lintel by means of a continuous moulding, running up the sides and across the top. As the lintel was frequently longer than the combined width of opening and jamb stones, and the moulding was cut round the outside, projections in the architrave or moulding were formed at the level of the lintel. These are called keys or *croisettes*. Examples of this occur in the Beule gateway of the Acropolis at Athens, in many Etruscan tombs from the 7th to the 5th century B.C., and in the temple of Hercules at Corn (72 B.C.). In the Etruscan examples the lintel keys are sometimes further decorated by down-curving pendants. In the developed classic treatment the moulding around the jamb and heads is treated as an architrave, usually with two or three bands and a raised moulding on the outside. Frequently a frieze and cornice are added, sometimes with consoles (*q.v.*), which are always set on the outside of the architrave moulding, as in the doorway of the Erechtheum (*q.v.*) at Athens, completed 408 B.C., and in the colossal doorway of the temple of Jupiter at Baalbek (c. A.D. 120) which is 20 ft. wide and 45 ft. high. The doorway of the Pantheon at Rome (A.D. 110-125), of the same width, still possesses the original Roman bronze door frame, door and transom screen.

In both the Romanesque and Gothic periods church doorways were among the most characteristic features of the styles. They were formed by means of an elaborate series of recesses in the thickness of the wall, usually in steps or orders, which ran not only up the sides, but also in an arch over the top, leaving a lunette (*q.v.*) or *tympanum* (a section of vertical wall) between the under side of the arch and the horizontal head of the door opening. These steps or orders were ornamented with mouldings, carvings and sculpture, occasionally columns were placed at the side. In Gothic work statues often take the place of columns, and bands of angels, under little canopies (*q.v.*), encircle the arch between the mouldings. The *tympanum* and door lintel are also richly sculptured, and there is often a central pier dividing the door opening in two, frequently carrying a statue, especially in the Gothic. A moulding projecting from the wall surface and called a drip or hood mould frequently surrounds the entire arch.

In the Renaissance period doorway design returned to generally classic lines. In the early Renaissance, however, classic motives of great complexity were used for doorway decoration in a manner far different from the usual Roman or Greek precedent. Colonnets, gables (half figures used as supports), pediments and arches with decorated lunettes are common, especially fantastic are the examples found in the transitional Renaissance of Germany, France and England. With increasing knowledge of classic detail more sober treatments prevailed. The use of columns and pilasters with pediments remained general. During the baroque period these basically classic motives received the typical fantastic and imaginary treatment. Noteworthy among these later Renaissance doorways are those of England and America in the late 18th and early 19th centuries, in which side-lights at each side of the door and a fanlight above, often with rich decorative leading, are all enclosed in a single doorway frame.

In Muslim countries doorways achieve enormous importance, the door itself being often merely an incident in a rich composition running the entire height of the wall. This usually takes the form of an arched niche or recess, sometimes crowned with a stalactite vault, sometimes simply a high pointed arch, as in the magnificent tile lined mosque doorways of Persia.

Chinese and Japanese doorways are commonly simple, their type of timber framing allowing little decorative treatment. Occa-

arched doorways with ornamented lunettes are found in gites, temples or palaces—especially in northern China.

through the art nouveau movement of the '90s give rise to y fantastic doorway schemes the general modernist trend is a return to simplicity. Exceptions are, however, frequent certain modernist doorways, particularly of commercial build, rich with carved ornament. (See ARCHITECTURAL ART, ARCHITECTURE, BYZANTINE AND ROMANESQUE ARCHITECTURE, CONSOLE, DOOR.)

DOPE, any thick liquid or semiliquid, paste preparation or ure used as a sauce, lubricant, etc. The term was used in a lubricant in the United States in 1876 in the *Viremia City-torial Entreprie* (Nev.) "Nothing was known of the teries of 'dope'—a preparation of pitch which being applied ne bottom of the shoes enables the wearer to glide over snow ened by the warmth of the sun."

ope is also the "shortest material"—mud, sawdust, vegetable ribent, etc.—which is used to hold and absorb a liquid in cer manufacturing processes, e.g., making high explosives. Abent dope such as greasy cotton waste is packed round the s of railway cars to reduce friction.

eronautics, dope is any of various varnishlike products h are applied to fabric surfaces of aeroplanes to make them t, strong, waterproof, etc. It is also the material applied to fabric of a balloon to reduce gas leakage.

U.S. slang the term refers to a drug, especially a harmful hich is taken by a narcotics addict. In racing slang it is a drug given to a race horse to stimulate it temporarily so means advance and confidential information or forecast id on such information or data. It is a slang expression for pid person. Used as a verb, it means "to stupefy with a drug;" also to work out or infer a solution, project, plan, etc.

the United States the term is used in the jargon of photy y for a preparation which consists chiefly of cellulose deriva s in solution and is used to make the transparent back of a tive film, dope is also a liquid varnish used in retouching tives. Fuel dope is a material added to gasoline to improve performance of the engine.

he word is apparently derived from the Dutch *doop* which ns sauce, drippings, etc.

OPPER, CORNELIS (1870–1939), Dutch composer and ductor, was born at Stads kanaal, near Groningen, on Feb. 7, 3. He studied at the Leipzig conservatory, 1887–92. After ducting operas in Holland and the United States, he became stant conductor to Willem Mengelberg at the *Concertgebouw*, sterdam, in 1908.

pper composed seven symphonies, including *Rembrandt* (2), *De Amsterdamse* (no. 6) and *Zuiderzee-Symphonie* (7). His composition for orchestra *Cianconia Gothica* (1920) me well known outside his own country. He also wrote sev operas and choral works. He died in Amsterdam on Sept. 18, 9.

OPPLER, ALBERT FRANZ (1821–1883), Austrian pposer and flutist, was born at Lemberg on Oct. 16, 1821. His er, who later was an oboist in Warsaw and Vienna, gave him first instruction in music. After making his début in Vienna, went on several concert tours with his younger brother Karl pler (1825–1900), who under his father and brother became accomplished flutist at a very young age. Albert Oppler be e first flutist at the Pest theatre, Hungary, where in 1847 his opera *Benjowsky* was performed. He went to Vienna in 1858 e became first flutist in the orchestra of the Vienna opera. He also assistant conductor of the ballet and later became the ductor. In 1865 he was named professor of flute at the Vienna servatory. His works include the operas *Ilika*, *Afenasia*, *nda*, *Salvator Rosa*, *Die beiden Husaren*, *Judit*, a comic et, *Margot* (Berlin, 1891), and many overtures and compo ns for the flute. He died at Baden, near Vienna, on July 27, 3.

arl Doppler was conductor at the National theatre, Pest, and he Hofoper in Vienna, 1862–65, and *Hofkapellmeister* in Stutt- , 1865–98. He wrote the opera *Erzabeth* with his brother and

Frnz Erkel and also wrote several Hungarian operas, ballets and flute pieces. He died at Stuttgart on March 10, 1900.

DOPPLER, CHRISTIAN JOHANN (1803–1853), Austrin physicist, was born at Salzbürg, on Nov. 20, 1803. He was educated at Salzbürg and Vienna, and became, in 1850, director of the Physic d Institute and professor of experimental physics at Vienna. He died at Venice on March 17, 1853. Doppler's earliest writings were on mathematics, but his name is associated with his work in physics. In 1842 he published 1 paper "Über des firsche Licht der Doppelsterne," which continued what is now known as Doppler's principle (see LIGHT: Waves and Interference). He drew the analogy between the sound coming from a moving source and the light coming from a moving star, i.e. the pitch of sound from a moving source varies, so Doppler thought the colour of the light from a star would be altered.

The principle was verified experimentally for sound by C. H. D. Buys Ballot in 1845, but the correct explanation in the optical case was given by Annual Tisserand in 1848.

Doppler's principle is applied to the motion of stars in the line of sight and is used for the discovery of double stars (see STAR).

DOPPLER EFFECT, the change in the observed frequency of a vibration owing to relative motion between the observer and the source of the vibration. In sound (q.v.) this effect is an everyday experience, e.g., when a ringing bell is passed at any speed above about 10 m.p.h. the pitch of the note suddenly sounds lower.

The Doppler effect for light waves is evident in spectroscopy (q.v., see also LIGHT: Waves and Interference).

DOPPLERITE, a naturally occurring organic substance found in amorphous, elastic or jellylike masses, of brownish-black colour, in peat beds in Styria and in Switzerland. It is tasteless, insoluble in alcohol and ether, and is described by Dana as an acid substance, or mixture of different acids, related to humic acid.

DORAN, JOHN (1807–1878), English author, was born in London of Irish parentage on March 11, 1807. He became a tutor with several distinguished families, and while travelling on the continent contributed journalistic sketches to *The Literary Chronicle*, a paper which was afterward incorporated with *The Athenaeum*. His play *Justice or the Venetian Jew* was produced at the Surrey theatre in 1824, and in 1830 he began to write translations from French, German, Latin and Italian authors for *The Bath Journal*. After some years of travel on the continent, he became in 1841 literary editor of *The Church and State Gazette*, and in 1852 under the title of *Fidula dolorosa* produced a memoir of Maria Thérèse Charlotte, duchesse d'Angoulême. Two years later he became a regular contributor to *The Athenaeum*. He succeeded Hepworth Dixon as editor of *The Athenaeum* for a short time in 1869, until he became editor of *Notes and Queries* in 1870. His most elaborate work, *Their Majesties' Servants*, a history of the English stage from Thomas Betterton to Edmund Kean, was published in 1860, and was supplemented by *In and About Drury Lane*, which was written for *Temple Bar* and was not published in book form until 1885. Among his other works may be mentioned *Table Traits and Habits of Men* (1854), *The Queens of the House of Hanover* (1855), *Knights and their Days* (1856), *Monarchs retired from Business* (1856), *The History of Court Fools* (1858), an edition of the *Bentley Ballads* (1858), *The Last Journals of Horace Walpole* (1859), *The Princess of Wales* (1860), and *Memoirs of Queen Adelaide* (1861). These were followed by *A Lady of the Last Century* (1873), an account of Elizabeth Montagu and the blue stockings, *London in the Jacobite Times* (1877), and *Memoirs of our Great Towns, with Anecdotic Clearings concerning their Worthies and their Oddities* (1878), a humorous work. Doran was married to Emma Gilbert, the daughter of a captain in the royal navy, at Reading, Berks, on July 3, 1834. He died in London on Jan. 25, 1878, and was survived by two children, Alban Doran, an only son, and Florence, an only daughter, who was married to Andreas Holtz of Twyford Abbey, near Ealing, Middlesex.

See *The Times*, Jan. 28, 1878, *Illustrated London News*, Feb. 9, 1878, and *Annual Register* (1878).

DORAT, CLAUDE JOSEPH (1734-1780), French man of letters, was born in Paris. He obtained a great vogue by his *Repons*, d'Abolard à Heloise, and followed up this first success with a number of heroic epistles, *Les Victimes de l'Amour*, ou *lettres de quelques amants célèbres* (1776). Besides light verse he wrote comedies, fables and novels. He was maladroït enough to draw down on himself the hatred both of the philosophic party and of their arch enemy, Charles Palissot, and thus cut himself off from the possibility of academic honours. *Le Tartufler littéraire* (1777) attacked La Harpe and Palissot, and at the same time D'Alembert and Mlle de Lespinasse. Dorat died in Paris on April 29, 1780.

See his *Oeuvres complètes* (20 vols., 1764-80), G. Desnoiretères, *Le Chevalier Dorat et ses poètes légers au XVIII^e siècle* (1887). For the bibliographical value of his works, see Henry Cohen, *Guide de l'amateur de livres à figures et à vignettes du XVIII^e siècle* (editions of Ch. Mehl, 1876, and R. Postals, 1887).

DORCHESTER, DUDLEY CARLETON, Viscount (1573-1632), English diplomatist, son of Antony Carleton of Baldwin Brightwell, Oxfordshire, was born on March 10, 1573, and educated at Westminster school and Christ Church, Oxford, where he graduated M.A. in 1600. As secretary to the earl of Northampton his name was associated with the Gunpowder Plot, but he succeeded in clearing himself. In 1610 he was knighted and was sent as ambassador to Venice, where he concluded the Treaty of Acti. In 1616 he was appointed ambassador to Holland. In his house at The Hague the unfortunate Elector Frederick and the princess Elizabeth took refuge in 1621. Carleton returned to England in 1625 with the duke of Buckingham, and was made vice-chamberlain of the household and a privy councillor. After an abortive mission to France he returned in 1626 and sought in the House of Commons (he had been a member since 1604) to defend his patron, the duke of Buckingham (created Baron Carleton of Imbercourt, and, after another mission to The Hague, Viscount Dorchester (1628)). He supported the conferences between Buckingham and Contarini for a peace with France on the eve of the duke's intended departure for La Rochelle, which was prevented by Buckingham's assassination. In December 1628 he was made principal secretary of State, and died on Feb. 15, 1632.

His voluminous correspondence, remarkable for its clear, easy and effective style and for the writer's grasp of the main points of policy, covers practically the whole history of foreign affairs during the period 1610-1628, and furnishes valuable material for the study of the Thirty Years' War. His letters are in two volumes: *The Hague, Jan. 1616 to Dec. 1620*, written and edited by Philip Yorke, afterwards second earl of Hardwicke, with a biographical and historical preface in 1757; his correspondence from The Hague, in 1627 by Sir Thomas Phillips in 1841; other letters are printed in the *Cabala* and in F. Birch's *Court and Times of James I. and Charles I.* but by far the greater portion remains in manuscript, the State papers.

DORCHESTER, GUY CARLETON, 1st Baron (1724-1808), British general and administrator, was born at Strabane, Co. Tyrone, Ireland on Sept. 3, 1724. He served in 1759 in America as quartermaster-general, under his friend Wolfe. He was wounded at the capture of Quebec and promoted to the rank of brigadier-general. From 1766 to 1778 he was governor-general of Canada. His justice and kindness greatly endeared him to the recently conquered French Canadians, and did much to hold them neutral during the War of American Independence. He ordered the first codification of the civil law of the province, and was largely responsible for the passing of the Quebec Act. On the American invasion of Canada in 1775 he was compelled to abandon Montreal and narrowly escaped capture, but defended Quebec (see) with skill and success. In October of the same year he destroyed the American flotilla on Lake Champlain. In 1777 he was superadded in his command of the military forces by Maj. Gen. John Burgoyne, and asked to be recalled. He returned, however, to America in May 1782 as commander-in-chief, remaining till November 1783. In 1786 he was again sent to Canada as governor-general and commander of the forces, with the title of Baron Dorchester. Many important reforms marked his rule, he kept the country loyal to the British crown amid the ferment caused by the French Revolution. In 1791 the province was divided into Upper and Lower Canada by the Constitutional Act. Of this

division Carleton disapproved, as he did also of a provision tending to create in the new colony an hereditary aristocracy. In 1796 he insisted on retiring. He died in England on Nov. 10, 1808. On the death in 1897 of the 4th baron (a grandson) the title became extinct, but was revived in 1899 for his cousin and co-heiress Henrietta Anne as Baroness Dorchester.

See J. C. Dent, *Canadian Portrait Gallery* (Toronto 1880), A. G. Bradley, *Life of Guy Carleton Lord Dorchester* (1907). Most of his letters and state papers are calendared in Brymner's *Reports on Canadian Archives* (Ottawa, 1885, seq.).

DORCHESTER, a market town and municipal borough and the county town of Dorsetshire, England, in the Western parliamentary division, 13½ mi. S.W. from London by the S.R. and also served by the Weymouth section of the G.W. Ry. Pop. (est. 1938) 10,230. Area 2.6 sq. mi. It stands on an eminence on the right bank of the river Frome, within a wide open tract of beautiful views, 6 mi. N. of the English channel at Weymouth bay. St. Peter's church is a Perpendicular building with a fine tower. All Saints and Holy Trinity churches were rebuilt in the last century, but St. George's, Fordington, retains Norman and Transitional details. Of public buildings the principal are the town hall, market house and corn exchange, shire hall, the interesting county museum, the county hospital and the former county, now government, prison. The grammar school, in modern buildings, was founded in 1569. A statue to Thomas Hardy, the poet and novelist, was unveiled in 1931. There is also a statue to William Barnes, the Dorsetshire poet (1801-1886). Hardy was born near Dorchester, which is the "Casterbridge" of the Wessex novels. A room containing part of his study and other memorabilia was opened in the museum in 1939. The town is noted also for its ale. It is a place of considerable agricultural trade, and large sheep and lamb fairs are held annually.

Durnovaria, at the intersection of a number of Roman roads, was a Romano-British country town of considerable size, probably successor to a British tribal centre of the Durotriges. The walls can be traced in part, and many mosaics, remains of houses, etc., have been found. The notable remains of a Roman amphitheatre are seen at Maumbury Rings, near the town. Maiden castle, on a hill 2 mi. S.W., is a vast earthwork encircled by gigantic embankments and ramparts, the whole occupying 120 ac. Excavations in 1934 indicated that the hill was the site of an important town in Iron Age times. Another smaller encampment is at Poundbury close by, and barrows and numerous other remains have been found in the vicinity. Little mention of Dorchester (*Dorcestre*, *Dorcestre*) occurs in Saxon annals, but a charter from Aethelstan to Millon abbey in 939 is dated at *villa regalis quae dicitur Dorcestria*, and at this period it possessed a mint. According to the Domesday survey it was a royal borough and had contained 172 houses, of which 100 had been totally destroyed since the conquest. Mention is made of a castle at Dorchester in records of the 12th and 13th centuries, and the Franciscan priory, founded some time before 1331, is thought to have been constructed out of its ruins. The latter was suppressed among the lesser monasteries in 1536. Edward II granted the borough to the bailiffs and burgesses at a fee farm rent of £20 for five years.

The first charter of incorporation, granted by James I. in 1610, established a governing council, which Charles I. in 1629 enlarged, while also incorporating the freemen of the borough with power to make laws for the regulation of the markets and trade. Dorchester returned two members to parliament from 1295 until the Representation of the People Act (1868) reduced the number to one, in 1885 the representation was merged in the county. Edward III granted to the burgesses the perquisites from three fairs, and three weekly markets. Elizabeth granted an additional three days' fair at Candelmas. Markets are now held on Wednesdays and Saturdays and fairs in February, May, July, August, October and November. The cloth industry which flourished during the 16th century never recovered from the depression following the Civil War. The malting and brewing industries came into prominence in the 17th century when there was also a considerable serge manufacture, which has since declined.

DORCHESTER, a large village in the Henley parliamentary division of Oxfordshire, England, 9 mi. S.S.E. of Oxford by road,

on the west bank of the river Thame, 1 mi. from its junction with the Thames. Pop. of civil parish (1931) 774. At Dike hill close to the present village there was a Roman station, and facing across the Thames, the double isolated mound known as Witterham Clumps (historically *Smodun*), is the site of ancient earthworks. In Dorchester itself the chief point of interest is the abbey church of St Peter and St Paul. This consists of a nave of great length, primarily of the transitional Norman period, a choir with arcades of the finest Decorated work, north choir aisle of the close of the 13th century, south choir aisle (c. 1300) and south nave aisle (c. 1320). The tower (western) is an erection of the late 17th century. The eastern bay of the choir is considered to have been added as a Lady chapel, and the north window is a magnificent example of a "Jesse window," in which the tracery represents the genealogical tree of Jesse, the complete execution of the design being carried on in the glass. The ancient sedilia and piscina are very fine. The Decorated windows on the south side of the church form a beautiful series, and there are early monuments and brasses of great interest.

Dorchester (*Dorcama, Dornacestre, Dorchestre*) was conquered by the West Saxons about 560. It occupied a commanding position at the junction of the Thames and the Thame, and in 635 was made the seat of a bishopric which at its foundation was the largest in England, comprising the whole of Wessex and Mercia, Birinus, apostle of the West Saxons, becoming its first bishop. The witenagemot of Wessex was held at Dorchester three times in the 9th century, and in 958 Aethelstan held a council here. In the 11th century the town is described as small but remarkable for the majesty of its churches, and c. 1086 the bishop's stool was removed to Lincoln by Remigius, the 23rd bishop. According to Domesday, Dorchester was held by the bishop of Lincoln. In 1140 Alexander bishop of Lincoln founded the abbey of Black Canons at Dorchester, of which the only remains are the abbey church. The town declined in importance after the removal of the cathedral, but in 1939 it was made a see suffragan to Oxford.

DORCHESTER, a residential and manufacturing district of Boston, Massachusetts, U.S.A., a separate town until 1870, between the Neponset river on the south and South Boston and Boston proper on the north. A ridge, with an average height of about 100 ft. above the sea, extends through the district from north to south and commands delightful views of Boston bay to the east and of the Blue hills to the south.

The Robert Pierce house, built in 1640, stands on its original site on Oakton avenue, and is one of Dorchester's landmarks. The Barnard Capen house, built about the same time, was moved to Milton. The James Blake house (1648) maintained by the Dorchester Historical society, has a library and a museum.

Not far away is the old Dorchester burying ground, which dates from 1634, it has many curious epitaphs, and contains the graves of Barnard Capen, who died in 1638 (probably the oldest marked grave in the United States), of William Stoughton (1631-1701), chief justice of the court which tried the Salem "witches" in 1692, and founder of the original Stoughton hall, Harvard, and of Rich and Mather.

Dorchester was founded by about 140 colonists from Dorsetshire, England, with whom the movement for planting the colony in Massachusetts Bay was begun under the leadership of Rev John White. They organized as a church while at Plymouth, England, in March 1630, then embarked in the ship "Mary and John," arrived in Boston bay two weeks before Governor Winthrop with the rest of the fleet, and in June selected Savin Hill as the site for their settlement. At the time the place was known as Mattapanock, but they named it Dorchester. In Oct. 1633, a town Government was organized, and the example was followed by the neighbouring settlements, this seems to have been the beginning of the town meeting form of government in America. Up to this time Dorchester was the largest town in the colony, but dissatisfaction arose with the location (Boston had a better one chiefly on account of the deeper water in its harbour), and in 1635-37 many of the original settlers removed to the valley of the Con-

necticut where they founded Windsor. New settlers, however, arrived at Dorchester and in 1639 that town established a school supported by a public tax, this was the first free school in America supported by direct taxation or assessment on the inhabitants of a town. It was the fortification of Dorchester Heights, under orders from Gen. Washington, on the night of March 4-5, 1776, that forced the British to evacuate Boston.

See W. D. Orcutt, *Good Old Dorchester* (Cambridge, 1893), and The Dorchester Book (Boston, 1899).

DORDOGNE, an inland department of south-western France, formed in 1790 from nearly the whole of Périgord, a part of Agenais, and small portions of Limousin and of Angoumois. Area 3,561 sq. mi. Pop. (1946) 387,643. It is bounded N. by Haute-Vienne, W. by Charente, Charente Maritime and Gironde, S. by Lot-et-Garonne, and E. by Lot and Corrèze. Situated on the western slopes of the Massif Central, Dordogne consists in the north-east and centre of sterile plateaus sloping towards the west, where they end in a region of pine forests known as the Double. The greatest altitudes are found in the highlands of the north, where many points exceed 1,300 ft. in height. Many beautiful river valleys, of the Dordogne, the Isle, with the Dronne and the Vézère, and the Vézère converge towards the southwest of the department. The climate is mild, but rather humid, especially in the north-east. Agriculture prospers in the south and south-west of the department, especially in the valleys of the Dordogne and the Isle, but the rest of its surface is covered to a great extent by woods and heath. Pasture and forage amply suffice for the raising of large flocks and herds. The vine, cultivated mainly in the neighbourhood of Bergerac, and tobacco are important sources of profit. Wheat and maize are the chief cereals and potatoes are largely grown. The truffles of Périgord are famous for their abundance and quality. The plum and cider-apple yield good crops. In the forests the prevailing trees are the oak and chestnut. The chestnuts are much used as food by the people and for fattening hogs, reared in large numbers. The walnut is extensively grown for its oil. The department has mines of lignite, and produces freestone, lime, cement, mill-stone, peat, potter's clay and fireclay. The leather industry and the preparation of preserved foods are important, and there are brick and tile works, earthenware manufactures and iron works. Exports consist of truffles, wine, chestnuts and other fruit, live stock, poultry and minerals of various kinds. Dordogne is served by the Orleans railway, the Dordogne, the Isle and the Vézère furnish nearly 200 mi. of navigable waterway. It is divided into the four arrondissements of Penguex, Bergerac, Nontron and Sarlat, with 47 cantons and 587 communes, and belongs to the ecclesiastical province of Bordeaux, to the académie (educational division) of Bordeaux and to the region of the XII army corps, which has its headquarters at Limoges. Its court of appeal is at Bordeaux.

Penguex, the capital, and the other principal towns are treated in separate articles. Bourdellès has two finely preserved châteaux, one of the 14th century, with an imposing keep, the other in 16th century Renaissance. Both buildings are contained within the same fortified enceinte. The château of Biron (11th century and later) has a beautiful chapel of late Gothic and early Renaissance workmanship. The château of Jumilhac-le-Grand is of the 15th century. Dordogne possesses several mediaeval *bastides*, the most perfect of which is Monpazier. At Cadouin there are the remains of a Cistercian abbey. Its church is a fine Romanesque building, while the cloister is excellent Flamboyant. St Jean-de-Côle has an interesting Romanesque church and a château of the 15th, 16th and 18th centuries. In the rocks of the valley of the lower Vézère there are prehistoric caves of great importance for the study of Palaeolithic man. Troglodytic dwellings are to be found in many other places in Dordogne.

DORDOGNE, a river of central and south-western France, rising at a height of 5,640 ft. on the Puy-de-Saucy, a section of the volcanic core of the Plateau Central in the department of Puy-de-Dôme, and flowing to the Gironde, with which it unites at Bec d'Ambès to form the Gironde estuary. It has a length of 295 m. and the area of its basin is 9,214 sq. miles. The Dordogne is a good example of a consequent stream of the

western section of the Plateau Central. In its course it cuts across a large number of geological formations, as do its two great right bank tributaries, the Vézère and the Isle. The Dordogne descends rapidly from its source and enters deep gorges as it flows through the Archaean plateau-country, rich in granites, until it reaches Beaulieu (département of Corrèze) where it enters a wide fertile valley and is joined by the Cère. Entering the département of Lot, it abandons a south westerly course for a westerly course. It now flows through limestone country, often in gorges with the Causses above on both sides. It traverses the département of Dordogne, where it receives the Vézère. The lower course of the latter is through a calcareous country, and its many caves have made it classic ground for the study of Palaeolithic man. Below the town of Bergerac the Dordogne enters the département of Gironde, and is joined by the Isle at Labourne. The river is some 3,300 yd wide at its union with the Garonne, 45 m from the sea. In its lower course it flows over Tertiary material. There are important bridges at Cubzac-les-Ponts. There is much river traffic after the confluence with the Vézère over the last 112 m of its course. The estuary of the Gironde is one of the most conspicuous features of the western coast of France, and the highest tides ascend the Dordogne as far as Pessac, a distance of approximately 100 m from the ocean.

DORDRECHT (abbreviated *Dordt* or *Dort*, old name THURDRECHT), in the province of South Holland, Holland, and a junction station 12½ mi SE of Rotterdam. It is connected with Papendrecht and Zwijndrecht on the opposite shore. Pop (1940) 62,007. Dordrecht was founded by Count Dirk III of Holland in 1018, becoming a town about 1200. One of the first towns in the Netherlands to embrace the reformed religion and to throw off the yoke of Spain, it was in 1572 the meeting place of the deputies who asserted the independence of the United Provinces. In 1618 and 1619 it was the seat of the synod of Dort (*q.v.*). It fell to German troops in 1940.

Dordrecht presents a picturesque appearance with its busy quays and numerous canals and windmills, its quaint streets and curiously gabled houses. The Groote Kerk, of Our Lady, with a massive tower, dates from the 14th century and contains some finely carved stalls (1540) by Jan Treenen Aertsz, and a remarkable pulpit (1759). In the town museum is an interesting collection of paintings, including pictures by some of the old masters, some of whom were natives of Dordrecht. Close to the museum is one of the old city gates, rebuilt in 1618, and now containing a collection of antiquities belonging to the Oud Dordrecht Society. The harbour of Dordrecht still has a large trade, but much has been diverted to Rotterdam. Large quantities of wood are imported from Germany, Scandinavia and America. There are numerous saw mills, shipbuilding yards, sugar refineries, etc.

DORÉ, PAUL GUSTAVE, (1832–1883), French artist, the son of a civil engineer, was born at Strasbourg on Jan. 6, 1832, and died in Paris on Jan. 23, 1883. In 1848 he came to Paris and secured a three years' engagement on the *Journal pour rire*. His facility as a draughtsman was extraordinary, and among the books he illustrated in rapid succession were Balzac's *Contes érolutiques* (1855), Dante's *Inferno* (1861), *Don Quixote* (1863), *The Bible* (1865), *Paradise Lost* (1866), *The Fables of La Fontaine* (1867), and the works of Rabelais (1873). He painted also many large and ambitious compositions of a religious or historical character, and had some success as a sculptor. Doré's illustrations had a great popular success over a long period of years, especially in England and America. See W. B. Jerrold, *Life of Gustave Doré* (1891).

DORIA, ANDREA (1466–1560), Genoese *condottiere* and admiral, was born at Oneglia of an ancient Genoese family. Being left an orphan at an early age, he became a soldier of fortune, and served first in the papal guard and then under various Italian princes. But it was as a naval captain that he became famous. For several years he scoured the Mediterranean in command of the Genoese fleet, waging war on the Turks and the Barbary pirates. In the meanwhile Genoa had been recaptured by the French, and in 1522 by the Imperialists. But Doria now veered round to the

French or popular faction and entered the service of King Francis I, who made him captain general, in 1524 he relieved Marseilles, which was besieged by the Imperialists, and helped to place his native city once more under French domination. But Francis was mean about payment, and he resented the king's behaviour in connection with Savona, which he delayed to hand back to the Genoese as he had promised, consequently on the expiry of Doria's contract we find him in the service of the emperor Charles V (1528). He ordered his nephew Filippino, who was then blockading Naples in concert with a French army, to withdraw, and sailed for Genoa, where he expelled the French once more and re-established the republic under imperial protection. He reformed the constitution in an aristocratic sense, and put an end to the factions which divided the city. He refused the lordship of Genoa and even the dogeship, but exercised predominant influence in the councils of the republic until his death. He was given two palaces, many privileges, and the title of *Liberator et Pater Patriae*. As imperial admiral he commanded several expeditions against the Turks, capturing Corona and Patras, and co-operating with the emperor himself in the capture of Tunis (1535). Charles found him an invaluable ally in the wars with Francis, and through him extended his domination over the whole of Italy. Doria's defeat by the Turks at Preveza in 1538 was said to be not involuntary, and designed to spite the Venetians, whom he detested. He accompanied Charles on the ill-fated Algerian expedition of 1541, of which he disapproved, and by his ability just saved the whole force from complete disaster. For the next five years there was hardly an important event in Europe in which he had not some share. After the peace of Crepy between Francis and Charles in 1544 he hoped to end his days in quiet. But he had many enemies, and in 1547 the Fiesco conspiracy to upset the power of his house took place. His nephew Giannettino was murdered, but the conspirators were defeated, and Andrea showed great vindictiveness in punishing them. He was implicated in the murder of Pier Luigi Farnese, duke of Parma (see FARNESE), who had helped Fiesco. Other conspiracies followed, of which the most important was that of Giulio Cibo (1548), but all failed. Doria successfully opposed the emperor Charles's repeated attempts to have a citadel built in Genoa and garrisoned by Spaniards, neither blandishments nor threats could win him over to the scheme. Nor did age lessen his energy, for in 1550, when eighty-four years old, he again put to sea to punish the raids of his old enemies the Barbary pirates, but with no great success. War between France and the Empire having broken out once more, the French seized Corsica, then administered by the Genoese Bank of St. George, Doria was again summoned, and he spent two years (1553–1555) in the island fighting the French with varying fortune. He returned to Genoa for good in 1555, and gave over the command of the galleys to his great-nephew Giovanni Andrea Doria. Andrea Doria died on Nov. 25, 1560, leaving his estates to Giovanni Andrea. The family of Doria Pamphili-Landi (*q.v.*) is descended from him and bears his title of prince of Melit. Doria was a man of indomitable energy and a great admiral. If he appears unscrupulous and even treacherous he did but conform to the standards of 16th century Italy.

See E. Petit, *André Doria* (Paris, 1887) which is an accurate and documented biography, indicating all the chief works on the subject, but the author is perhaps unduly harsh in his judgment of the admiral; F. D. Guerrazzi, *Vita di Andrea Doria* (3rd ed., Milan, 1874). Among the earlier works L. Cappelioni's *Vita di Andrea Doria* (Italian edition, Genoa, 1863) and V. Signorini's *Vita di Andrea Doria* (1576) may be mentioned; see also "Documenti ispano genovesi del l'Archivio di Simancas" in the *Atti della Società ligure di storia patria*, vol. VIII, the *Archivio storico italiano* (serie II, tome IV, part I, 1866) contains a bibliography, but a great deal has been published since that date.

DORIANS. In classical times a fourfold division ran through the Greek world, linguistic and partially social. The Dorians represent one section of this division, the remaining three being Aeolians, Ionians and Arcado-Cyprians or Achaeans. They were settled in the Peloponnese where they were the dominant race, in the Sporades and in Crete, in south-western Asia Minor, and in a string of colonies along the eastern and southern coasts of Sicily. Between Mount Parnassus and Oeta was a small district

called Doris, whose inhabitants in historic times spoke an Aeolic dialect. They were distinguished from other Greeks by their dialect, by a calendar of festivals, and by certain social and political institutions. The worship of Apollo and of Heracles was looked upon by the Greeks as being in some sense more particularly Dorian, though not confined to Dorian peoples.

The Doric dialect, of which there were several varieties, was allied with a group known as North-west Greek, spoken in Phocis, Locris and Elis, as opposed to Aeolic, Ionic, Attic and Arcado-Cyprian, which may be said to have formed loosely an eastern group. Some of its characteristics are the retention of τ where Attic shows σ in verbal endings such as *ἔδωται*, in *-καίτοι* as the termination in the *hundreds* in place of *-κοσίοι* etc., the formation of the nominative plural of the article in *τοί, ται, ὅκα, τόκα, τόκα for ὅτε, τότε, πότε* etc., the termination of the first person plural active in *-μεν* instead of *μεν, ε, γ, φεποιες*, the formation of the future in *-σσω*, the lengthening of ϵ and $ο$ to η and ω in place of ϵ and $ο$, the reduction of intervocalic σ to h and in some cases its complete disappearance. The Cretan dialects showed peculiarities of their own. The Doric dialects continued in use until displaced by the *κοινή* based upon Attic, which became the common language of Greece in Hellenistic times. The modern Zakonian dialect spoken in the neighbourhood of Sparta exhibits characteristics which entitle it to be regarded as the descendant of an ancient Doric dialect, possibly Laconian. Within the Doric group Laconian inclined in certain respects to agreement with Aeolic where Corinthian and Argolic show rather more similarity to Ionic.

It is clear that the Dorians were a conquering stratum of the population in the Peloponnese. Beside the fact that a non-Doric dialect survived in Arcadia closely akin to the dialects of Cyprus, the social structure of the Doric cities provides evidence that the Dorians had conquered and were holding in subjection a former population. Sparta was the armed camp of a close aristocracy which alone possessed political rights. The majority of the population, known as Helots, were serfs, hostile to their masters and breaking into rebellion whenever opportunity presented itself. Between the Helots and the Spartan families was a class known as *perioeci* (*g v*) who were not slaves but did not enjoy Spartan rights. In the 8th and 7th cent. B.C. Sparta's expansion and

Homer's time were a small Thessalian tribe, and the extension of their name illustrates the possibility of a similar process in the case of that of the Dorians. The inheritance of Dorus was in central Greece between that of Aeolus in Thessaly and of Xuthus in the Peloponnese. Under Aegimius, a descendant of Dorus, the Dorians acquired the country between Mounts Parnassus and Oeta, thenceforward known as Doris. An alliance took place between Aegimius and the Heraclidae, Hyllus son of Heracles being adopted by Aegimius. There followed the expeditions to the Peloponnese to assist the Heraclidae to recover their inheritance there. The route of the invasion was through Aetolia and Elis, the Corinthian Gulf being crossed at Naupactus. After several attempts the conquest of the Peloponnese was achieved. Thucydides dates the invasion 80 years subsequent to the Trojan War, and it was generally regarded as having taken place in the second half of the 12th or early in the 11th century. Megara and Corinth were conquered rather later. From the alliance between Aegimius and the Heraclidae dated the threefold Dorian division into Hyllies, Dymanes and Pamphyli.

A second tradition, current in the 4th century, brought the Argive Dorians to the eastern Peloponnese by sea. Their starting-point is not stated. It is assumed to be the Malac gulf, which is the nearest sea-coast to Doris in central Greece. The Cretan Dorians were regarded as an offshoot of this expedition from which they were considered to have separated in Histiaeotis.

The facts of the Dorian overlordship in the Peloponnese show the invasion and conquest to have been historical, and light may be thrown upon the whereabouts of the former homes of the invaders by the names of the three Dorian tribes. Hyllies is the name of a large and widespread Illyrian tribe settled upon the Dalmatian coast of the Adriatic and centring around the promontory known anciently as Hyllis, now as Sabbioncello. Indeed the name Illyrii may be identical with that of the Hyllies except for an additional suffix. Again the tribal name Dymanes has a termination frequent in Epirus and exemplified in such names as Atintanes, Athamanes, Akarnanes, etc. Both these names point decisively to the north-west and confirm the tradition of an invasion across the Corinthian gulf from Aetolia to Elis, of an Illyrian or Epirote tribe. What of the Pamphyli? The second tradition, that the Dorian conquerors of Argolis reached the east coast of the Peloponnese by sea, has already been mentioned. Is it possible that it is wrongly assumed that the starting point of this expedition was the Malac gulf, and that such an invasion took place, but from Crete and the south-eastern Aegean? Is it too bold to connect the name Pamphyli with the familiar Anatolian Pamphylia? In Homeric times Dorians are recorded only in Crete. The constitution of Lycurgus at Sparta was traditionally derived from Crete. We know that the Achaeans were in pre-Homeric times in the eastern Aegean and later in the Peloponnese and the Greek mainland. Thus a Dorian migration from east to west across the Aegean would have merely followed in the wake of previous Achaean migrations, while Dorian attacks upon the Peloponnese from Crete would have been no more than repetitions of previous Minoan history. Thus an invasion of the Achaean Peloponnese by northern hordes was coincident with attacks from Crete and the Aegean. It may well have been designedly coincident, one set of invaders calling in the other as allies, and such an amalgamation may well explain the double kingship at Sparta. If the name Dorian first applied to a small tribe in Crete and later became extended to the new masters of the Peloponnese as a whole, this fact is no stranger than the increase of scope of the name Hellenes, which underwent an even wider development. The Parmassian Doris was never in historical times the home of Dorians. It represents perhaps no more than a coincidence of name, which is not surprising and far from unparalleled, especially if it connects with the root of *δρῦς, δένον, tree*, etc. It is possible that the northern invaders occupied it for a time before their irruption into the Peloponnese.

A widely held view would bring all Greek-speaking peoples by land to Greece from the north in three successive waves, Ionian, Achaean and Dorian, the first two being the promoters of Mycenaean civilization. This presupposes an original "Helladic" popula-

ant a decision. The other Doric cities of the Peloponnese, notably Argos and Corinth, though their constitutions differed widely from that of Sparta, presented similar strata of population, between whom a social and political compromise had been reached. Sparta was not typical but peculiar. The so-called constitution of Lycurgus, however, under which she was governed, was closely reflected in Dorian Crete. The double kingship suggests prehistoric amalgamation. Owing to Sparta's dominant position in the Dorian world in historical times the rest of Greece was inclined to regard what was peculiarly Spartan as typically Dorian. The rivalry of race between Dorian and Ionian underlay the struggles of the Greek world until at least the 4th century, being prominent in the Peloponnesian War at the close of the 5th century.

When and from what direction did the Dorian invasion of the Peloponnese take place? Homer knew of Dorians only in Crete. The mainland of Greece was inhabited in Homeric times by a people called Achaeans, which was the general name for Greeks afterwards replaced by the name Hellenes. In the Hesiodic genealogies Dorus appears as a son of Hellen beside Aeolus and Xuthus the father of Ion and Arctus. It is evident that at that time (7th or 6th century) these four divisions were regarded as comprising together the whole Greek world. The Hellenes or

tion of Greece, whose language is unknown and whose origin is unexplained. All Greek settlements in the Aegean, Asia Minor and Cyprus were on this view colonized from the mainland of Greece.

Doris was also in historical times the collective name of the Dorian cities in south-western Asia Minor, corresponding with Ionia and Aeolia. Whether or not Dorians had dwelt in this region since Homeric times, that is to say, since a date previous to their occupation of the Peloponnese, these cities had received an influx of population from the Peloponnese and looked to it in historical times as the home of their mother cities.

Nilsson, *Minos Mycenaean Religion*, Introduction (1927). For the dialects see C. D. Buck, *Introduction to the Study of the Greek Dialects* (1910). (B F C A)

DORIA-PAMPHILI-LANDI, a princely Roman family of Genoese extraction. The founder of the house was Ansaldo d'Orta, consul of Genoa in the 12th century, but the authentic pedigree is traced no further back than to Paolo d'Orta (1335). The most famous member of the family was Andrea Doria (q.v.). The marquises of Civiez and the county of Cavallanone were conferred on the family in 1576, the duchy of Tursi in 1594, the principality of Avella in 1607, the duchy of Avigliano in 1613. In 1760 the title of *Reichsfürst* or prince of the Holy Roman Empire was added and attached to the lordship of Torriglia and the marquessate of Borgo San Stefano, together with the qualification of *Hochgeboren*. That same year the Dorias inherited the fiefs and titles of the house of Pamphili-Landi of Gubbio, patricians of Rome and princes of San Martino, Valmontano, Val di Toro, Bardì and Cupriano. The Doria-Pamphili palace in Rome, a splendid edifice, was built in the 17th century, and contains a valuable collection of paintings. The Villa Doria Pamphili with its gardens is one of the loveliest round Rome. During the siege of 1849 it was Garibaldi's headquarters.

DORIC ORDER, in architecture, the simplest and earliest perfected of the Greek orders, adopted and developed in a modified form by the Romans, characterized by a simple, moulded capital, and the existence in the frieze of upright, grooved forms, known as triglyphs separated by squares, known as metopes (see *Order*).

DORION, SIR ANTOINE AIMÉ (1816-1891), Canadian lawyer and statesman, was born at Sainte Anne de la Perade on Jan. 17, 1816 of an old Liberal family. He studied law under Cherrier, was called to the bar in 1842, and rose rapidly in his profession. At the time that Dorion commenced the study of law, Canada was entering upon a new phase of her political life. The rebellion of 1837 had resulted in the suspension of the constitution of 1791 and the union of provinces, effected under the Imperial Act of 1840, was framed to compel the obedience of the refractory population. The elections of 1854 had brought new blood into the ranks of the Liberal party, young men eager to carry out measures of reform, and Dorion was chosen as leader under the coalition brought about by McNEIL between the Tories of Upper Canada and the Liberals of the lower province old ideas were removed, and after the abolition of seigniorial tenure and clergy reserves, it appeared that the political atmosphere was clear. In 1856 the question of representation by population was again prominent. Upper Canada had increased, and it contributed a larger share to the revenue, and demanded proportionate representation. Macdonald, who became prime minister in 1856 and had formed a new government with Cartier in 1857, maintained that no amendment to the constitution was necessary, that existing conditions were satisfactory. Brown, on the opposite side of the House, declared that representation by population was imperative, with or without constitutional changes, and Dorion appears to have suggested the true remedy, when he gave notice of a motion in 1856—

That a committee be appointed to inquire into the means that should be adopted to form a new political and legislative organization of the heretofore provinces of Upper and Lower Canada, either by

the establishment of their former territorial divisions or by a division of each province, so as to form a federation, having a federal government and a local legislature for each one of the new provinces, and to deliberate as to the course which should be adopted to regulate the affairs of united Canada, in a manner which would be equitable to the different sections of the province.

Dorion was in advance of the time. He understood the true principle of federative union as applicable to Canada. But he did not pursue this idea. On Aug. 2, 1858 he formed an administration with Brown, but was forced to resign after being in office three days. When the question of confederation was discussed a few years later he opposed the scheme, believing there was nothing to justify the union at the time. In 1873 he became minister of justice in the Mackenzie government, and secured the passage of the Electoral Law of 1874 and the Controverted Elections Act. Dorion sat as a member of the assembly for the province of Canada for the city of Montreal from 1854 to 1861, for the county of Hochelaga from 1862 to 1867, as member of the House of Commons for the county of Hochelaga from 1867 to July 1872, and for the county of Napierville from Sept. 1872 to June 1874, when he was appointed chief justice of the province. In 1878 he was created a knight bachelor. He died at Montreal on May 31, 1891.

See Fennings Taylor, *Dorion, a Sketch* (Montreal, 1865), "Sir Antoine Aimé Dorion," by Sir Wilfrid Laurier, in *The Week* (1887).

DORIS, a small district in central Greece, between Mts. Oeta and Parnassus, containing the headwaters of the Cephissus. This little valley, which nowhere exceeds 4 m. in breadth and has but four small townships, owed its importance partly to its command over the road from Heraclaea to Amphissa, but chiefly to its prestige as the alleged mother country of the Dorian conquerors of Peloponnesus (see *DORIANS*). Its history is mainly made up of petty wars with Oetaeans and Phocians. In 457, the Spartans, admitting their claim to be the Dorian metropolis, sent an army to their aid, and again during the second Sacred War (356-346). Except for mention of its cantonal league in 196, Doris passed early out of history.

See Strabo, pp. 417, 427, Herodotus 1.56, viii. 31, Thucydides 1.107, iii. 92, Diodorus xii. 29, 33, W. M. Leake, *Travels in Northern Greece*, chap. xi (1835).

DORISLAUS, ISAAC (1595-1649), Anglo-Dutch lawyer and diplomatist, was born at Alkmaar, Holland, the son of a minister of the Dutch Reformed Church. He was educated at Leyden, removed to England about 1627, and was appointed to a lectureship in history at Cambridge, where his attempt to justify the Dutch revolt against Spain led to his early resignation. In 1629 he was admitted a commoner of the College of Advocates. In 1632 he made his peace at court, and on two occasions acted as judge advocate, in the bishops' war of 1640 and in 1642 in the army commanded by Essex. In 1648 he became one of the judges of the admiralty court, and was sent on a diplomatic errand to the States General of Holland. He assisted in preparing the charge of high treason against Charles I., and, while negotiating an alliance between the Commonwealth and the Dutch republic, was murdered at The Hague by royalist refugees on May 10, 1649.

DORKING, a market town and urban district in the Regent parliamentary division of Surrey, England, with three (including Box Hill, four) railway stations on the Southern railway, about 26 m. S.W. of London. Pop. of urban district (1938) 17,110. Area 15 sq. m. It lies at the edge of the North Downs in the sheltered valley of the river Mole, near the base of Box Hill, and is noted for the beauty of its countryside. It is the centre of an extensive residential district. The parish church of St. Martin's is a handsome edifice rebuilt in 1873. Lime of exceptionally good quality is burned in the neighbourhood and is derived from the Lower Chalk formation. Dorking gives its name to a well-known breed of fowl distinguished by its having five toes. Several fine mansions are in the vicinity of the town, notably that of Deepdene, containing part of a gallery of sculpture collected by Thomas Hope, the author of *Anastasis*. The Roman road of Stone street, which crossed from the Sussex coast to the Thames, passed near the present churchyard of St. Martin. The district has literary associations, including the names of George Meredith, who lived and is buried here, Fanny Burney, Malthus and others.

DORLÉANS, LOUIS (1542-1629), French poet and political pamphleteer, was born in Paris. He studied under Jean Daurat, and after taking his degree in law began to practise at the bar with but slight success. After the league had arrested the royalist members of parliament, he was appointed (1589) advocate general. His *Avertissement des catholiques anglais aux Français catholiques* went through several editions, and was translated into English. Dorléans was proscribed when Henry IV entered Paris. He took refuge in Antwerp, but was arrested nine years later, and returned to Paris, where he was soon imprisoned for sedition. The king, however, released him after three months in the Conciergerie.

DORMAN, THOMAS (d. 1577?), Catholic theologian, was born at Berkhamstead, Hertfordshire. His uncle Thomas Dorman of Agmondesham (Amersham), Buckinghamshire, supported him while he studied at the Berkhamstead free school, where he was a student of Richard Reeve, a well known protestant teacher.

In 1547 Thomas Harding, a Catholic scholar, sent Dorman to Winchester school. He later attended New College, Oxford, and was elected a probationer fellow. He became a fellow of All Souls' college in 1554 and was awarded the degree of bachelor of civil law in 1558.

Opposing the religious changes made after the accession of Queen Elizabeth in 1558, Dorman left England. In Antwerp he was urged by Harding, who was in exile, to continue his studies. Dorman became a student of theology in Louvain, and in 1565 he was graduated as bachelor of divinity from the University of Douai, in northern France, founded by Philip II of Spain in 1562. The university later awarded him the doctorate.

Dorman assisted in the establishment of the English college, founded at Douai in 1568 by William Allen. In 1572 or 1577, Dorman died in the city of Tournai.

His theological works include *A Proufe of Certeyne Articles in Religion demed by Mr Jewel* (Antwerp, 1564), *A Disproufe of Mr Alex. Nowell's Reproufe* (Antwerp, 1565), *A Request to Mr Jewel that He keep His Promise made by Solemn Protestation in His Late Sermon at Paul's Cross, 15 June, 1567* (London, 1567, Louvain, 1567).

DORMER, in architecture, a projection from a sloping roof, containing a window. Dormers may occur either on the face of the wall or high up on the roof, their roofs may be gabled, hipped, flat or with one slope. Wherever steep, high roofs are common, dormers are common, in order to light the space within. Simple dormers, frequently in several rows, characterize the steep roofs of Teutonic countries, but in the late Gothic and early Renaissance periods, certain dormers, whose fronts were on the wall line of the building, were built in masonry and richly decorated. Similar elaborate dormers, usually with gabled roofs, are characteristic of the French châteaux from the time of Louis XII to that of Louis XIV, and of Tudor work in England and Scotland, examples of dormers, ornamented with pinnacles, tracery and buttresses, occur in the Palais de Justice at Rouen (end of the 15th

century). Heidelberg castle (1556), and the châteaux of Blois and Chambord (time of Francis I) show characteristic Renaissance enrichment. The term "dormer" arose from the windows being those of sleeping rooms. The phrase "dormer beam" is the equivalent of the modern sleeper.

DORMITORY, the name given in monasteries to the monks' sleeping apartment. It sometimes formed one long room, but was more generally subdivided into as many cells or partitions as there were monks. The dormitories were sometimes of great length, that of the monastery of San Michele in Bosco near Bologna, now suppressed, is said to have been over 400 feet. In some of the larger Elizabethan mansions the space in the roof constitutes a long gallery, which in those days was occasionally utilized as a dormitory. The name dormitory is also applied to the large bedrooms with a number of beds, in schools and similar modern institutions, and also to any institutional building whose purpose is to furnish sleeping quarters for pupils or others, irrespective of whether or not they are divided into individual rooms.

DORMONT, a residential borough of Allegheny county, Pa., U.S., on the southern edge of Pittsburgh. The population was 13,405 in 1950 and 12,974 in 1940 by federal census.

Incorporated in 1909, Dormont adopted the council manager form of government in 1922 under an ordinance passed by the city council. The name was derived from the French *mont d'or*, or golden mount.

DORMOUSE, a small rodent, *Muscardinus avellanarius*, is the sole representative of its genus, but belongs to the family Gliridae (often, Muscardinidae), this contains a number of old world species. All the dormice are small rodents, of arboreal habits, and for the most part of squirrel like appearance, some of their most distinctive features being internal. In the more typical members of the group, forming the subfamily Glirinae, there are four pairs of cheek teeth, which are rooted and have transverse enamel folds. As the characters of the genera are given in the article RODENTIA it will suffice to state that the typical genus *Glis* is represented by the European edible dormouse, *G. glis*, a gray species with black markings and about 8 in. long, known in Germany as the *Siebenschläfer*, the genus ranges from continental Europe to Japan. The common dormouse *Muscardinus avellanarius*, ranging from England to Russia and Asia, is of the size of a mouse. The fur is tawny above and paler beneath, with a white patch on the throat. The third genus is represented by the continental *lerot*, or garden dormouse, *Eliomys quercinus*, which is a large chestnut coloured species, with black cheeks.

There are several local forms or races. A large number of African species belong to the genera *Clavulus* and *Graphurus*. In their arboreal life and the habit of sitting up on their hind legs with their food grasped in the forepaws, dormice are like squirrels, from which they differ in being completely nocturnal. They live either among bushes or in trees, and make a neat nest for the reception of their young, which are born blind. The species inhabiting cold climates construct a winter nest in which they hibernate, waking up at times to feed on an accumulated store of nuts and other food. Before retiring they become very fat, and at such times the edible dormouse is a favourite article of diet on the continent. The young are generally four in number, and are produced twice a year. They are born blind, but in a marvellously short period are able to cater for themselves, and their hibernation begins later in the season than with the adults. A second subfamily is represented by the Indian *Platacanthomys* and the Chinese *Typhlomys*, in which there are only three pairs of cheek teeth, the teeth have oblique cross ridges, the palate is fenestrated and the bullae are small. (J. E. H.)

DORNBIRN is a township in the Austrian province of Vorarlberg, at the foot of the Bregenzerwald. The name is a collective appellation for four straggling villages—Dornbirn, Hatlerdorf, Oberdorf and Haselstauden—chiefly important as small centres manufacturing textiles and iron goods with motive power from the Dornbirner Ach, a tributary of the Rhine. Pop. (1948) 22,516. Germany annexed the township in 1938.

LEFT: SILVER TYPE OF DORMER. RIGHT: LATE FLEMISH TYPE FROM PALAIS DE JUSTICE, ROUEN.

DORNBURG, a town of Germany, in the *Land* of Thuringia, situated 400 ft. above the Saale, 7 mi NE of Jena. Population 918. Dornburg is chiefly famous for its three grand ducal castles. The Altes Schloss is built on the site of an imperial stronghold (Kaiserpfalz) once a bulwark against the Slavs, often a residence of the emperors Otto II and Otto III, and the place where the emperor Henry II held a diet in 1005. Goethe was often a guest at the Neues Schloss, built (1728-48) in Italian style. The third castle is the so-called Stohmannsches Rittergut, purchased in 1824 and fitted as a modern palace.

DORNER, ISAAC AUGUST (1809-1884), German Lutheran divine, was born at Neuhausen, Württemberg on June 20 1809. After studying at Tübingen, he travelled in England and Holland, and in 1837 became professor extraordinarius of theology at Tübingen. His *Entwicklungsgeschichte der Lehre von der Person Christi* (1835-39) an indirect reply to Strauss' *Life of Jesus*, led to his being invited in 1839 to Kiel as professor ordinarius. There he wrote, among other works, *Das Prinzip unserer Kirche nach dem innern Verhältniss seiner zwei Seiten betrachtet* (1841). In 1843 he removed to Königsberg, in 1847 to Bonn, in 1853 to Göttingen and in 1862 to Berlin. In 1867 appeared his valuable *Geschichte der protestantischen Theologie* (Eng. trans., 1871). His ultimate position as one of the "mediating" theologians is best seen in his *Christliche Glaubenslehre* (1879-81). The companion work *System der christlichen Sittenlehre* was published in 1886. He founded and for many years edited the *Jahrbuch für deutsche Theologie*. He died at Wiesbaden on July 8, 1884.

See Herzog Hauck, *Realencyclopädie*, Pfeleiderer, *The Development of Theology in Germany since Kant* (1890), F. Lichtenberger, *History of German Theology in the Nineteenth Century* (1889), Carl Schwarz, *Zur Geschichte der neuesten Theologie* (1869).

DORNOCH

Dornoch, a town of Scotland, in the county of Moray, was neglected till 1837, when it was restored, and has since been used as the parish church. It is the burying-place of the Sutherland family and contains the remains of sixteen earls. The ancient castle was also the bishop's palace, its west tower remains, the rest was destroyed in 1570. Dornoch became a royal burgh in 1628. It was the scene of the last execution for witchcraft in Scotland (1722). At Embo, 2 m NNE, a sculptured stone commemorates the battle with the Danes in the 13th century, in which Richard de Moravia was killed. He was buried in the cathedral, where his effigy was found in the chancel. Skibo castle, about 4 m W of Dornoch, once a residence of the bishops of Caithness, was acquired in 1808 by Andrew Carnegie.

DOROHOI or DOROGOI, the capital of the department of Dorochoi, Rumania, on the right bank of the river Jijia, which broadens into a lake on the north. Dorochoi is a market for the timber and furs produce of the north Moldavian highlands, merchants from the neighbouring States flock to its great fair, held on June 12. There is a church built by Stephen the Great (1458-1504). Population 15,375.

DOROTHEUS, a professor of jurisprudence in the law school of Berytus in Syria, and one of the three commissioners appointed by the emperor Justinian to draw up a book of Institutes to serve as an introduction to the *Digest* already completed. His colleagues were Tribonian and Theophilus, and their work was accomplished in 529. Dorotheus later wrote a commentary on the *Digest*, which is called the *Hexa*, and was published by him in 542. Fragments of this commentary have been preserved in the *Scholion* appended to the *Basilica*, from which it seems probable that the commentary of Dorotheus contained the substance of a course of lectures on the *Digest* delivered by him in the law school of Berytus.

D'ORSAY, ALFRED GUILLAUME GABRIEL,

COUNT (1801-1852), a famous dandy and wit, was born in Paris on Sept. 4, 1801, and was the son of General D'Orsay, from whom he inherited an exceptionally handsome person. In his youth he entered the French army and served as a *garde du corps* of Louis XVIII. In 1822, while stationed at Valence on the Rhone, he met the earl and countess Blessington (q.v.) whose house he had visited when in London a little earlier. At the invitation of the earl he accompanied the party on their tour through Italy. In the spring of 1823 he met Lord Byron at Genoa, and the published correspondence of the poet at this period contains numerous references to the count's gifts and accomplishments, and to his peculiar relationship to the Blessington family. A diary which D'Orsay had kept during a visit to London in 1821-22 was much praised by Byron for the knowledge of men and manners and the keen faculty of observation it displayed. On Dec. 1, 1827, Count D'Orsay married Lady Harriet Gardiner, a girl of 15, the daughter of Lord Blessington by his previous wife. The union, if it rendered his connection with the Blessington family less ostensibly equivocal than before, was in other respects an unhappy one, and a separation took place almost immediately. After the death of Lord Blessington, which occurred in 1829, Lady Blessington returned to England, accompanied by Count D'Orsay, and her home, first at Seamore Place, then at Gore House, soon became a resort of the fashionable literary and artistic society of London. Count D'Orsay had been from his youth a zealous Bonapartist, and one of the most frequent guests at Gore House was Prince Louis Napoleon. In 1849 he went bankrupt, and the establishment at Gore House being broken up, he went to Paris with Lady Blessington, who died a few weeks after their arrival. His relations with Napoleon were less cordial after the *coup d'état* of 1851 of which he disapproved. His appointment to the post of director of fine arts was announced only a few days before his death which occurred on Aug. 4, 1852.

Count D'Orsay was the supreme dandy, and the list of his accomplishments is surprising. In addition to wit, charm, and taste in dress and furniture, he was a good shot, a good horseman, a good fencer and even a good boxer. He had considerable skill in painting and sculpture as well. It is more surprising, perhaps, to find him in the light of benefactor to distressed compatriots in England, and as the original founder of the *Société de Bienfaisance*.

Much information as to the life and character of Count D'Orsay is to be found in Richard Madden's *Literary Life and Correspondence of the Countess of Blessington* (1855).

DORSET, EARLS, MARQUESSSES AND DUKES OF,

English titles one or more of which had been borne by the families of Beaufort, Grey and Sackville. About 1070 Osmond, or Osmer, an alleged son of Henry, count of Séz, by a sister of William the Conqueror, is said to have been created earl of Dorset, but the authority is a very late one and Osmond describes himself simply as bishop (of Salisbury). William de Mohun of Dunster, a partisan of the empress Matilda, appears as earl of Dorset or Somerset, these two shires being in early times united under a single sheriff. In 1397 John Beaufort, earl of Somerset (d. 1410), the eldest son of John of Gaunt, duke of Lancaster, and Catherine de Aragon, was created duke of Dorset.

John Beaufort, earl of Dorset, was created marquis of Dorset (see below). He was succeeded in this title by his son Thomas (1477-1530), and then by his grandson Henry (1510-54), who was created duke of Suffolk in 1551. When in Feb. 1554 Suffolk was beheaded for sharing in the rising earl of Huntingdon, which he had received in 1471, was created marquis of Dorset (see below). He was succeeded in this title by his son Thomas (1477-1530), and then by his grandson Henry (1510-54), who was created duke of Suffolk in 1551. When in Feb. 1554 Suffolk was beheaded for sharing in the rising

of Sir Thomas Wyatt, the marquessate of Dorset again became extinct, but in 1604 Thomas Sackville (see the account of the family under SACKVILLE, 1ST EARL) was created earl of Dorset (see below) and his descendant, the 7th earl, was created duke in 1720. In 1843 the titles became extinct.

THOMAS GREY, 1ST MARQUESS OF DORSET (1451-1501), was the elder son of Sir John Grey, 7th Lord Ferrers of Groby (1432-61), by his wife, Elizabeth Woodville, afterwards queen of Edward IV. He fought for Edward at Tewkesbury, in 1475 he was created marquess of Dorset. After the death of Edward IV Dorset and his brother, Richard Grey, supported their half brother, the young Edward V, thus incurring the enmity of Richard duke of Gloucester, afterwards Richard III. Richard Grey was arrested and beheaded at Pontefract in June 1483, while the marquess saved his life by flight. Dorset was one of the leaders of the duke of Buckingham's insurrection, and when this failed he joined Henry earl of Richmond in Brittany, but he was left in Paris when the future king crossed to England in 1485. After Henry's victory at Bosworth the marquess returned to England and his attainer was reversed, but he was suspected and imprisoned when Lambert Simnel revolted, he had however, been pardoned, had marched into France and had helped to quell the Cornish rising, when he died on Sept. 20, 1501.

Dorset's sixth son, Lord Leonard Grey (c. 1490-1541), went to Ireland as marshal of the English army in 1535, and in 1536 was appointed lord deputy in succession to Sir William Skeffington. He was accused, probably with truth, of favouring the family of the Geraldines, to whom he was related, and quarrelled fiercely with the rival family of the Butlers. Returning to England in 1540 he was condemned to death for treason. He was beheaded on July 28, 1541 (See R. Bagwell, *Ireland under the Tudors*, vol. 1, 1885).

THOMAS GREY, 2ND MARQUESS OF DORSET (1477-1530), the eldest son of the 1st marquess, fled to Brittany with his father in 1484. He spent some years in prison under Henry VII, but was highly favoured by Henry VIII, who gave him command in France in 1512, and in 1523 made him warden of the Scottish eastern and middle marches. He was famous for his skill in the tournament. He died on Oct. 10, 1530.

His eldest son, Henry Grey, 3rd marquess of Dorset, was in 1551 created duke of Suffolk (q.v.). A younger son, Lord Thomas Grey, was beheaded in 1554 for sharing in the rebellion of Sir Thomas Wyatt, another son, Lord John Grey, was also sentenced to death for his share in this rising, but his life was spared by the efforts of his wife, Mary, daughter of Sir Anthony Browne. Under Elizabeth, Lord John, a strong Protestant, was restored to the royal favour. He died on Nov. 19, 1569. In 1603 his son Henry (d. 1614) was created Baron Grey of Groby, and in 1628 his great-grandson Henry was made earl of Stamford (For the 1st earl of Dorset, see SACKVILLE, THOMAS).

EDWARD SACKVILLE, 4TH EARL OF DORSET (1591-1652), son of the 2nd earl, succeeded his brother Richard, the 3rd earl (1590-1624), in 1624. He had attained much notoriety by killing Edward Bruce, 2nd Lord Kinloss, in a duel, and in 1620 he fought for James I's son-in-law, Frederick V, elector palatine of the Rhine, at White Hill, near Prague. In the House of Commons, where he represented Sussex, Sackville defended Bacon and advocated an aggressive policy for the recovery of the Rhenish Palatinate, twice he was ambassador to France, and he was interested in Virginia, and the Bermuda islands. Under Charles I he was a privy councillor and lord chamberlain to Henrietta Maria. At the outbreak of the Civil War, he joined the king at York, but he endeavoured to secure peace. At Oxford he was lord chamberlain to the king and lord president of his council, but Charles did not altogether approve of his pacific attitude. He died on July 17, 1652. His wife Mary (d. 1645), daughter of Sir George Curzon, was governess to the sons of Charles I, the future Charles II and James II.

CHARLES SACKVILLE, 6TH EARL OF DORSET (1638-1706), English poet and courtier, son of Richard Sackville, 5th earl (1622-77), was born on Jan. 24, 1638, and succeeded to his father's estates and title in 1677. In Charles II's first parliament

he sat for East Grinstead, Sussex. He won a reputation as courtier and wit at Whitehall, where he bore his share in the excesses for which Sir Charles Sedley and the earl of Rochester were notorious. In 1662 he and his brother Edward, with three others were indicted for the robbery and murder of a tanner named Hoppy. The defence was that they were in pursuit of thieves, and mistook Hoppy for a highwayman. In 1665 he volunteered to serve under the duke of York in the Dutch war. His famous song, "To all you Ladies now at Land," was written, according to Prior, on the night before the victory over "foggy Opdm" off Harwich (June 3, 1665). Dr. Johnson, with the remark that "seldom any splendid story is wholly true," says that the earl of Orery had told him it was only retouched on that occasion. In 1667 Pepys laments that he had lured Nell Gwyn away from the theatre, and that with Sedley the two kept "merry house" at Epsom. Next year the king was paying court to Nell, and her "Charles the First," as she called him, was sent on a "sleeveless errand" into France to be out of the way. His gaiety and wit did not especially recommend him to James II. He retired from court at the beginning of the new reign. Dorset concurred in the invitation to William of Orange, who made him privy councillor, lord chamberlain (1689), and knight of the Garter (1692). During William's absences in 1695-98 he was one of the lord justices of the realm.

He was a generous patron of men of letters. Dryden's "Essay on Satire" and the dedication of the "Essay on Dramatic Poesy" are addressed to him. Walpole (*Catalogue of Noble Authors*, iv) says that he had as much wit as his first master, at his contemporaries, Buckingham and Rochester, without the royal want of feeling, the duke's want of principle or the earl's want of thought, and Congreve reported of him when he was dying that he "slabbered" more wit than other people had in their best health.

The fourth act of *Pompey the Great*, a tragedy translated out of French by certain persons of honour, is by Dorset. The satires for which Pope classed him with the masters in that kind seem to have been short lampoons, with the exception of *A Faithful Catalogue of our Most Eminent Ninnies* (reprinted in *Bibliotheca Curiosa*, ed. Goldsmid, 1885). *The Works of the Earls of Rochester, Roscommon and Dorset, the Dukes of Devonshire, Buckinghamshire, etc.*, with *Memoirs of their Lives* (1731) is catalogued (No. 20,841) by H. G. Bohn in 1841. His *Poems* are included in Anderson's and other collections of the British poets.

LIONEL CRANFIELD SACKVILLE, 1ST DUKE OF DORSET (1688-1765), the only son of the 6th earl, was born on Jan. 18, 1688. He succeeded as 7th earl of Dorset in 1706, and was created duke of Dorset in 1720. He was twice lord steward of the household, twice lord-lieutenant of Ireland, and lord president of the council from 1745-51. His second viceroyalty of Ireland (1750-55) was stormy and ended in dismissal. The duke died on Oct. 10, 1765. He left three sons: Charles, the 2nd duke, John Philip (d. 1765), and George, who took the additional name of German in 1770, and in 1782 was created Viscount Sackville (q.v.).

CHARLES SACKVILLE, 2ND DUKE OF DORSET (1711-1769), an associate of Frederick, prince of Wales, was a member of parliament for many years and a lord of the Treasury under Henry Pelham, he died on Jan. 5, 1769. His nephew, John Frederick (1745-1799), 3rd duke, was ambassador in Paris from 1783 to 1789, and lord steward of the household from 1789 to 1799, he died on July 10, 1799, and was succeeded by his only son, George John Frederick (1793-1815). When the 4th duke died unmarried in Feb. 1815, the titles passed to his kinsman, Charles Sackville German (1767-1843), son and heir of the 1st Viscount Sackville, who thus became 5th duke of Dorset. When he died on July 29, 1843, the titles became extinct.

DORSET, a south western county of England, bounded north-east by Wiltshire, east by Hampshire, south by the English Channel, west by Devon and north-west by Somerset. The area is 973 square miles.

In the centre of the county the chalk hills of the western downs sweep south-west from Cranborne Chase through Blandford, Milton Abbas and Frampton to Dorchester. Here the chalk outcrop narrows and turns south-eastward by Portland and Bournemouth to West Lulworth, whence it is continued eastward as the Purbeck hills. Within this rim of chalk is a fringe of Reading

beds and London clay which may be traced from Cranborne through Wimborne Minster, near Bere Regis and Puddletown, then southeastward through West Knighton, Winfrith and Lulworth, and along the northern side of the Purbeck hills to Studland. Bounded by this arc and occupying the eastern portion of the county is a low lying region of sands, gravel and clay, probably an extension of the Hampshire basin. Denudation has revealed the Wealden beds in the vale between Lulworth and Swanage, and also near East Chaldon. The town of Shaftesbury stands upon a hill of Greensand, while the Upper Greensand also forms the high ground above Lyme Regis, Golden Clee and Pilsden and Lewesden Pans. It is thought that a stream following the syncline of the Frome valley, the Solent and the Spithead was at one time the chief feature of the drainage. Subsidence, however, has resulted in the tributaries of this stream now finding their way independently to the sea. The Stour rises in Wiltshire and flows with a general southeasterly course, to join the Hampshire Avon near its mouth. It receives the Cole and Liddin, which drain the Vale of Brinkmore, in its upper course, and breaches the western downs in its middle course between Sturminster Newton and Blandford.

The small river Puddle or Trent and the Frome flow across the eastern plain and almost unite their mouths in Poole harbour.

In the northwest the Yeol flows northward to join the Parrett and so sends its waters to the Bristol channel. The Char, the Brit and the Bridr, drain the southwest. Lulworth Cove is an excellent example of differential marine erosion. Chesil Bank has been formed from debris accumulated there by up channel currents.

Archaeology and History.—Several beakers indicate early settlement. One handled beaker found 3 mi. from Dorchester, on the Ridgeway hill, may imply influences from eastern England (*See* *Excavations in Dorset*, vol. ix, pt. 1, p. 19). Numerous interments of cremated bones (including many cinerary urns but few incense cups), disc-barrows resembling those of Wiltshire, unchambered barrows and stone circles, testify to the importance of Dorset in the Bronze age. The sheltered waters of Weymouth, with access to the well drained chalk uplands of the interior, favoured maritime trade. At Wareham was found a palisade of a type largely confined to southern England and northern France, which has been considered as an indication of early intercourse with neighbouring parts of the continent (*See* Crawford, in *L'Anthropologie*, tome xiv, 1913, pp. 641-649). The numerous earthworks, of which the best known is Maiden Castle, may have been constructed to guard the principal routes from the coast. The finding of La Tène brooches at Woodcuts, Iwerne, Blandford and Maiden Castle (Dorchester) suggests contacts with north-western France during the Early Iron age (*See* Fox, *Arch. Camb.*, vol. lxxvii, pt. 1, pp. 67-112).

The kingdom of Wessex originated with the settlement of Cedric and his followers in Hampshire in 495. In 705 the West Saxon see was transferred to Sherborne, and many religious houses were founded later. In 787 the Danes landed at Portland, and in 833 they arrived at Charmouth and fought with Egbert. The shire is first mentioned by name in the Saxon Chronicle in 845. During the following 2½ centuries Dorset was constantly ravaged by the Danes.

Several of the West Saxon kings resided in Dorset, and Aethelwold and Aethelbert were buried at Sherborne, and Aethelred at Wimborne. In the reign of Canute Wiltshire was the last town Dorset formed part of Harold's kingdom, and its resistance to the Conqueror was punished by the devastation of Dorchester, Wareham, Shaftesbury and Blandford.

No Englishman retained important estates after the conquest, and at the time of the survey the bulk of the land, except 46 manors held by the king, was in the hands of religious houses, the abbots of Cleeve, Milton and Shaftesbury being the most wealthy. There were 272 mills, and nearly 80 men were employed in working salt along the coast. Minis existed at Shaftesbury, Wareham, Dorchester and Blandford, the three former having been founded by Aethelstan. King John frequently hunted in the county. In

the time of Egbert, Wessex was divided into definite *pagi*, each under an ealdorman, which no doubt represented the later shires. The *Inquisitio Gildarum*, drawn up two years before the Domesday survey, mentions the 39 pre-conquest hundreds of Dorset. The 33 hundreds and 21 liberties of the present day retain some original names, but boundaries have changed. Until the reign of Elizabeth, Dorset and Somerset were united under one sheriff. After the transference of the West Saxon see from Sherborne to Sarum, in 1075, Dorset remained part of that diocese until 1542, when it was included in the newly formed diocese of Bristol. The vast power and wealth monopolized by the Church in Dorsetshire tended to check the rise of any great county families.

The three chief churches are the abbey church of Sherborne (*qv*), Wimborne Minster (*qv*) and Milton Abbey church, a Decorated and Perpendicular structure erected on the site of a Norman church.

Dorset took no active part in the struggles of the Norman and Plantagenet period. In 1627 the county refused to send men to La Rochelle. On the outbreak of the Civil War the general feeling was in favour of the king, and in 1643 Lyme Regis and Poole were the only garrisons in the county left to the parliament. By 1644, however, parliament had gained the whole county except Sherborne and the Isle of Portland. The remains of Corfe castle (*qv*) and of Sherborne castle may still be seen. The general aversion of Dorset people to warlike pursuits is demonstrated at this period by the rise of the "clubmen," so called from their appearance without pikes or firearms at county musters, whose object was peace at all costs. In the 14th century Dorset produced much wheat and wool and had a prosperous clothing trade, which declined after the ravages of the plague in 1626. The hundred of Pimperne produced saltpetre in the 17th century, and the serge manufacture was introduced about this time. Portland freestone was first brought into use in the reign of James I, and after the Great Fire it was extensively used by Sir Christopher Wren. In the 18th century Blandford, Sherborne and Lyme Regis were famous for their lace. The county returned two members to parliament in 1290, in 1572 the county and nine boroughs returned a total of 20 members. Under the Reform Act of 1832 the county returned three members, and Corfe castle was disfranchised. Lyme Regis was disfranchised in 1868 and the remaining boroughs in 1885. Under the Representation of the People act, 1918, the county returns four members.

Agriculture and Industries.—The climate is mild, and in some sheltered spots semi-tropical plants flourish. Much fine timber appears in the richer soils, in some of the sheltered valleys of the chalk district, and more especially upon the Greensand, though many woods have been cleared. In 1939 there were only 97,525 ac. of arable land, but 318,108 ac. (76.5% of the total acreage under crops and grass) of permanent grass, including 69,173 ac. of rough grazing ground, the chalk downs being celebrated for sheep walks. The chief crops were oats (16,282 ac.), wheat (15,561 ac.) and turnips and swedes (11,204 ac.). Barley and mangolds followed, with 8,430 ac. and 3,017 ac. respectively. Devons, Shorthorns and Herefords are the most common breeds of cattle, and dairy farming is extensively carried on. The National Trust owned 9 ac. in the county in 1942.

The quarries of the Isles of Portland and Purbeck are important. The first supplies a much used white freestone. Purbeck marble was used for many of the most famous Gothic churches in England. A valuable product of Purbeck is a white pipelay, exported to the potteries of Staffordshire from Purbeck. Some shipbuilding is carried on at Poole, and ship repair is made at several towns. Other small manufactures are those of flax and hemp in the neighbourhood of Blandford and Bournemouth, or bricks, tiles and pottery in the Poole district, and of nets (herring, as the industry is called) in some of the villages. There are silk mills at Sherborne and elsewhere. The chief ports are Poole, Weymouth, Swanage, Blandford and Lyme Regis. The harbour of Bournemouth at Portland, under the admiralty, is an important fortified naval station.

The main line of the Southern railway serves Gillingham and Sherborne, in the north of the county. Branches of this system serve Wimborne, Poole, Swanage, Dorchester, Weymouth and

Portland The last two towns, with Bridport, are served by the Great Western railway, the Somerset and Dorset line follows the Stour valley by Blandford and Wimborne, and Lyme Regis is the terminus of a light railway from Axminster on the Southern ry

The population of the administrative county was, in 1938, 252,240. An increase in the county population of 3% between Sept. 1939 and Feb. 1941 was caused by wartime movements. The county contains eight municipal boroughs, and four urban districts. It and Poole each have a court of quarter sessions and there are nine petty sessional divisions. The dialect of the county, distinguishable from those of Wiltshire and Somersetshire, yet bearing many common marks of Saxon origin, is admirably illustrated in some of the poems of William Barnes (q.v.). Many towns, villages and localities are readily to be recognized from their descriptions in the "Wessex" novels of Thomas Hardy (q.v.).

BIBLIOGRAPHY—A curious ancient *Survey of Dorsetshire* was written by the Rev. M. Coker, about the middle of the 17th century, and published from his ms. (1732). See also J. Hutchins, *History and Antiquities of the County of Dorset* (1774), and ed. by R. Gough and E. B. Nichols, 1790–1815, 3rd ed. by W. Shop and J. W. Hudson, 1861–73; C. Warne, *Ancient Dorset* (1865); R. W. Eyles, *A Key to Dorsetshire, Exemplified by an Analysis and Digest of the Dorset Survey* (1878); C. H. May, *Bibliotheca Dorsetiensis* (1885); W. Barnes, *Glossary of Dorset Dialect* (Dorchester, 1886); H. de Moule, *Old Dorset* (1893); *Victoria County History, Dorsetshire, The Land of Britain* (Report of Land Utilisation Survey, pt. 88), (London, 1940).

DORT, SYNOD OF. An assembly of the Reformed Dutch Church, with deputies from Switzerland, the Palatinate, Nassau Hesse, East Friesland, Bremen, Scotland and England, called to decide the theological differences existing between the Arminians (or Remonstrants) and the Calvinists (or Counter-Remonstrants), was held at Dort or Dordrecht (q.v.) in 1618 and 1619. The government of Louis XIII. prohibited the attendance of French delegates. During the life of Arminius a bitter controversy had sprung up between his followers and the strict Calvinists, led by Francis Gomar, his fellow professor at Leyden, and, in order to decide their disputes, a synodical conference was proposed, but Arminius died before it could be held. The essential contentions of the Arminians were the denial of irresistible predestination and the affirmation that Christ died for all men, not only for the "elect". In 1614, at the instance of the Arminian party, an edict was passed by the states general, in which toleration of the opinions of both parties was declared and further controversy forbidden, but this act only served, by rousing the jealousy of the Calvinists, to fan the controversial flame into greater fury. Gradually the dispute pervaded all classes of society, and religious questions became entangled with political issues, the partisans of the house of Orange espoused the cause of the stricter Calvinism, whereas the bourgeois oligarchy of republican tendencies, led by Oldenbarnevelt and Hugo Grotius, stood for Arminianism. In 1617 Prince Maurice of Orange committed himself definitely to the Calvinist party, found an occasion for throwing Oldenbarnevelt and Grotius into prison, and furthermore in 1617 called a synod intended to crush the Arminians. This synod, which was assembled at Dort in November 1618, was strictly national—called by the national authority to decide a national dispute—and not intended to have more than a national influence. The foreign deputies were invited to attend, only to assist by their advice in the settlement of a controversy which concerned the Netherlands church alone, and which the Netherlands church alone could decide. At the fourth sitting it was decided to cite Simon Episcopus (q.v.) and other Remonstrants to appear within fourteen days before the synod, to state and justify their doctrines. It was also agreed to allow the Arminian deputies to take part in the deliberations, only on condition that they forebore to consult with, or in any way assist, their cited brethren, but this they refused. When Episcopus and the others cited appeared, the former surprised the deputies by a bold and outspoken defence of his views, and even went so far as to say that the synod, by excluding the Arminian deputies, could now only be regarded as a schismatic assembly. The Remonstrants were asked to file copious explanations of the points in dispute (*Sententia Remonstrantium*) but objecting to the manner in which they were catechized, they were dismissed from the synod. The synod then proceeded in their absence to judge

them from their published writings, and came to the conclusion that as ecclesiastical rebels and trespassers they should be deprived of all their offices. The synodical decision in regard to the five points is contained in the canons adopted at the 136th session held on April 23, 1619, the points were unconditional election, limited atonement, total depravity, irresistibility of grace, final perseverance of the saints. These doctrinal decisions and the sentence against the Remonstrants were, at the 144th sitting, read in Latin before a large audience in the great church. The Remonstrants were required to subscribe the condemnation and many of them refused and were banished. "The canons of Dort represent the last effort of rigid Calvinistic orthodoxy to meet the difficulties and objections besetting their system both from a popular and a theological point of view" (See REMONSTRANTS).

DORTMUND, a town of Germany, in the Prussian province of Westphalia, on the Emscher, in a fertile plain, 50 m. E. from Düsseldorf by rail. Pop. (1939) 537,000.

Dortmund, the Throtmanns of early history, was already a town of some importance in the 6th century. In 1005 the emperor Henry II. held here an ecclesiastical council, and in 1016 an imperial diet. The town was walled in the 12th century, and in 1387–1388 successfully withstood the troops of the archbishop of Cologne for twenty-one months. About the middle of the 13th century it joined the Hanseatic League. In 1803 Dortmund lost its rights as a free town, and was annexed to Nassau. The French occupied it in 1806 and in 1808 it was made over by Napoleon to the grand duke of Berg, and became the chief town of the department of Ruhr. Through the cession of Westphalia by the king of the Netherlands, on May 31, 1815, Dortmund became a Prussian town.

The old walls were abolished in 1863, but the centre of the town retains a mediaeval aspect. Its ancient buildings include Remoldkirche, with fine stained glass windows, Marienkirche, the nave of which dates from the 11th century, and Petrikirche, with a curious altar, and the Dominican church, with beautiful cloisters. The 13th century town hall was restored in 1899 and now contains the municipal antiquarian museum. Dortmund owes its development to its situation in the centre of the Westphalian coal basin. In the immediate vicinity are also extensive beds of iron ore, and the town competes with Essen, Oberhausen, Duisburg and Hagen in the products of the iron industry. These in Dortmund include steel rails, mining plant, wire ropes, machinery, safes and sewing machines. Its armful, oil tanks and factories were constant targets for British bombers in World War II. It is a railway centre and is also connected with the river Ems by the Dortmund-Ems canal, 170 m. in length.

DOSITHEUS MAGISTER, Greek grammarian, flourished at Rome in the 4th century A.D. He was the author of a Greek translation of a Latin grammar, intended to assist the Greek speaking inhabitants of the empire in learning Latin. The Latin grammar used was based on the same authorities as those of Charisius and Diomedes. Dositheus contributed very little of his own. Some Greek Latin exercises by an unknown writer of the 3rd century, are of value as illustrating the social life of the period and the history of the Latin language. Of these *Hermeneumata*, the third book, containing a collection of words and phrases from every day conversation has been preserved. A further appendix consisted of anecdotes, letters and rescripts of the emperor Hadrian, fables of Aesop, extracts from Hyginus, a history of the Trojan War, and a legal fragment, *De manumissionibus*.

EDITIONS—*Grammatica* in H. Kell, *Grammatica Latina*, vi and separately (1871); J. Tolkien (Lips. 1913); *Hermeneumata* by G. Goltz (1902) (in G. Lowe's *Corpus glossariorum Latinarum*, vi) and E. Bocking (1812), which contains a Latin translation of the legal fragment. See also C. Lachmann, *Veruck über Dositheum* (1837); H. Hagen, *De Dositheo magistro quae feruntur glossae* (1877).

DOSSERET, or impost block, in architecture, the block of stone sometimes used in the Byzantine style above the capital (g.v.) of a column. It has the form of a truncated pyramid, with the large side up, and therefore furnishes ample bearing for carrying the arches and vaults above it.

DOSSO DOSSI, GIOVANNI (1479-1542), Italian painter, the head of the Ferrarese school in the 16th century. His real name was Giovanni de' Luterio. His father, Niccolò de' Luterio a native of Trent, settled at Ferrara, and Giovanni and his brother Battista (d. 1549) were probably born at Dosso, a village near Mantua. Vasari does not mention the name of their master, but according to Scannelli they studied under Lorenzo Costa, while Morelli suggests that their first teacher was G. Pancetti. We know by documentary evidence that Battista was in Rome in 1519, there is, however, no proof that Dosso studied in Rome.

His work is Ferrarese, though his colour is under Venetian influence.

From 1514 Dosso was in the service of Alfonso d'Este. He painted portraits of the Este family, he decorated the ducal palaces and executed designs for tapestries and majolica. The two brothers Dosso, though not always on good terms with one another, often co-operated, as in the decoration of the ducal palace of Ferrara, of the palace of the Gonzaghi at Mantua (1512), of the Villa Imperiale near Pesaro, and of the bishop's palace at Trent (1532). Dosso died at Ferrara shortly before Aug. 27, 1542. He was a friend of his compatriot Ludovico Ariosto, and, like this great poet, loved to depict romantic scenes from pagan myths or from legends of Christian chivalry. His fantastic "Circe" in the Galleria Borghese might be an illustration of Ariosto's poetry. The admiration was reciprocal, for in the *Orlando Furioso* (xxviii, 2) Dosso ranks with Leonardo, Michelangelo, Raphael, Titian, Bellini and Mantegna. Dosso was a poet in his colour schemes. His shadows are saturated with colour, his lights sparkling and strong. He was an innovator in landscape painting, for he made the scenery take part in the drama enacted by the figures. Thus the background in the "Adoration of the Magi" (National Gallery, London) is illuminated by a supernatural light.

Nearly all the frescoes of Dosso are much damaged or have perished. However, a number of oil paintings have survived. Besides those mentioned above the following are his chief works: the altarpiece in the cathedral of Modena representing the "Madonna and Saints", the altarpiece of the cathedral of Ferrara representing "St. Bartholomew and John the Baptist" which has passed into the Chigi collection, the "Four Fathers of the Church" in the Dresden gallery, this gallery also contains several pictures from the ducal palace of Ferrara, some by Dosso and others designed by him and completed by his brother and Girolamo Campi.

The gallery at Modena contains some fine examples and several of his works are at Hampton Court Palace.

Gardner, *The Painters of the School of Ferrara* (1911), C. Zwanziger, *Dosso Dosso* (1911). H. Mendelsohn *Dosso Dosso* (1913).

DOST MOHAMMED KHAN (1793-1863), founder of the dynasty of the Barakzai in Afghanistan, was born in 1793. His elder brother, the chief of the Barakzai, Fateh Khan, took an important part in raising Mahmud to the sovereignty of Afghanistan in 1800 and in restoring him to the throne in 1809. But Mahmud secured his assassination in 1818, and thus incurred the enmity of his tribe. After a bloody conflict Mahmud was deprived of all his possessions but Herat, the rest of his dominions being divided among Fateh Khan's brothers. Of these Dost Mohammed received Ghazni, to which in 1826 he added Kabul, he at once found himself involved in disputes with Ranjit Singh, the Sikh ruler of the Punjab, who used the deposed Saduzai prince, Shuja ul-Mulk, as his instrument. In 1834 Shuja made a last attempt to recover his kingdom. He was defeated by Dost Mohammed under the walls of Kandahar but Ranjit Singh seized the opportunity to annex Peshawar. The recovery of this fortress became the Af-

ghan amir's great concern. Rejecting overtures from Russia, he sought alliance with England, and welcomed Alexander Burnes to Kabul in 1837. But the governor general, Lord Auckland, did not respond to the amir's advances. Dost Mohammed was enjoined to abandon the attempt to recover Peshawar, and to place his foreign policy under British guidance. In return he was only promised protection from Ranjit Singh, of whom he had no fear. He replied by renewing his relations with Russia, and in March 1839 a British force under Sir W. Lushington Cotton advanced through the Bolan pass, and on April 25, it reached Kandahar. Shah Shuja was proclaimed amir and entered Kabul on Aug. 7, while Dost Mohammed sought refuge in the Hindu Kush. On Nov. 4, 1840, he surrendered. He remained in captivity during the British occupation, during the disastrous retreat of the army of occupation in Jan. 1842 and until the recapture of Kabul in the autumn of 1842. He was then freed.

On his return from India Dost Mohammed was received in triumph at Kabul. From 1846 he renewed his policy of hostility to the British and allied himself with the Sikhs, but after the defeat of his allies at Gujrat on Feb. 21, 1849, he led his troops back into Afghanistan. In 1850 he conquered Balkh, and in 1854 acquired control over the southern Afghan tribes by the capture of Kandahar. On March 30, 1855, he concluded an offensive and defensive alliance with the British government. In 1857 he declared war on Persia in conjunction with the British and in July a treaty was concluded by which the province of Herat was placed under a Barakzai prince. During the Indian mutiny Dost Mohammed punctiliously refrained from assisting the insurgents. His later years were disturbed by troubles at Herat and in Bukhara. These he composed for a time, but in 1862 a Persian army, acting in concert with Ahmad Khan, advanced against Kandahar. The old amir called the British to his aid and, putting himself at the head of his warriors, drove the enemy from his frontiers. On May 26, 1863, he captured Herat, but on June 9 he died suddenly in the midst of victory, after playing a great role in the history of central Asia for 40 years. He was succeeded by his son, Sher Ali Khan.

See Mohun Lal, *Life of Dost Mohammed Khan* (London, 1846).

DOSTOIEVSKI, THEODORE (FYODOR) MIKHAYLOVICH (1821-81), Russian writer, b. Moscow Oct. 30 (O.S.), 1821, his father of Ukrainian extraction, his mother of Moscow merchant stock. He was educated in Moscow, and at the School of Military Engineers in St. Petersburg (Leningrad). In 1847 he obtained a commission in the army, but three years later he left the service to devote himself to literature. In 1845 he completed his first novel, *Poor Folk*. Its publication, in the following year, was one of the great events which marked the coming of a new literary age in Russia. Dostoevski came to be regarded as the most promising of the young novelists. But his second novel, *The Double*, published before the end of the same year (1846) disappointed the critics, and his success began to wane. He continued, however, to work with great productivity for the next three years, producing a great number of novels and stories, among which the most important are *Mr. Prokharichin*, *The Landlady* and *Netochka Nezvanova*. These early works display the strong influence of Gogol, and to a less extent of Balzac. Unlike the later work they betray intense interest in problems of form, and a great variety and conscious originality of verbal expression. Passionate sympathy with the humiliated and the downtrodden, and intense interest in morbid psychology (*The Double*) are already very apparent. In *Netochka Nezvanova* (1849) appears for the first time that type of "proud girl" which was to play such a prominent part in the great novels of his maturity. Though Dostoevski had quarrelled with the liberal litterateurs owing to their failure to appreciate *The Double* and to their constant puns, and his morbid self-consciousness suffered from the systematic teasing of some of them (especially Turgenev), he continued to be intimate with another circle of advanced young men who, under the guidance of Petrashevski, met to study the French socialists and discuss social and political reform in Russia.

The reactionary wave that followed 1848 brought with it the arrest (April 23, 1849) and trial of the Petrashevski circle.

Dostoevski and the other "conspirators" were condemned to deportation, but a bogus sentence of death was read to them and mock preparations for the execution were gone through the real sentence being communicated to them only at the last moment before the expected volley (Dec. 21, 1849). These moments produced a fatal impression on Dostoevski and he alludes to them more than once in his later work. His epilepsy, the first traces of which go back to before the sentence, was greatly aggravated by it. For four years Dostoevski was a convict in the penal settlement of Omsk. These years profoundly changed his mind, and it was then that he evolved his new Christianity, which was essentially based on worshipping Christ because he was worshipped by the Russian people. Early in 1854 he was released from prison and transferred to a private to a unit stationed in Siberia. In 1855, he had his commission restored to him, and in 1859 he was finally amnestied and allowed to live in the capitals. In Siberia he fell in love and married Marie Isaeva, a sensual and crude woman, who brought him no happiness. From 1856 onwards he was able to resume his literary work. His first novel after these seven years of enforced silence was the *Manor of Stepanchikovo* (English version—*The Family Friend*) (1859), written in Siberia. Its central figure of Foma Opiskin is one of the greatest, and most repulsive, satirical character creations in Russian literature. After his return to St. Petersburg he published *The House of Death* (1861), in which he embodied his prison impressions, and which remained till after his death the most generally popular of his works, and *The Insulted and the Injured* (1862), in which the influence of the more sentimental aspects of Dickens are plainly apparent.

At the same time he engaged in journalism, trying to steer an independent course between the conservatives and the freethinking radicals. His programme was a democratic and Christian nationalism, equally hostile to reaction and to atheistic radicalism, and inspired by a faith in the Russian peasant people, as the depository of supreme spiritual values. With his brother Michael and several other valuable allies, he started a review, *Vremya* (*The Times*) which, in spite of hostility from both right and left, succeeded in winning the public ear and was financially a success. In 1863 it was, however, suppressed by the Government on what soon proved a misunderstanding. The Dostoevskis were allowed to revive the review under a new name (*Epokha*), but the new publication failed to revive the success of its predecessor. Michael Dostoevski died (1864), and after a year and more of struggle against adverse circumstances Dostoevski succumbed, discontinued the review and found himself burdened with debts he was unable to pay, besides the obligation of keeping his brother's family.

This crisis coincided with a profound crisis of his inner life. His first wife died. Before her death he had already become intimate with Pauline Suslova, a young woman of sensual, proud and "demonic" character. His brief intimacy with her appears to have been one of the crucial experiences of his life. In 1863 he travelled with Pauline abroad, strengthening his aversion from bourgeois civilization and contracting the gambling habit. In 1864 he published *Letters from the Underworld* which marks a turning point in his work and from which we must date the final maturity of his genius. After the failure of *The Epoch* Dostoevski became a victim to the callous exploitation of publishers, for whom he had to work by writing with superhuman speed such works as *Crime and Punishment* (1866) *The Gambler* (1867). While writing them he employed as secretary Anna Grigorievna Snitkina, whom in 1867 he married. This coincided with a complete financial collapse. He went abroad to escape his creditors, and for four years lived there, passing much of his time at the gambling house of Baden-Baden. Only gradually, by dint of hard work at the series of novels that have since made his name famous in the world was he able once again to support himself.

In 1871 he returned to Russia, and soon obtained a situation as editor of a conservative weekly (1873-74). After 1876 he published and edited a journal of his own, *An Author's Diary*, in which he continued the line of national and democratic Christianity started by the *Vremya*. He became influential as a journalist

and his last years were spent in comparatively favourable circumstances. His contemporary fame reached its culminating point in 1880, after his address on the unveiling of the Pushkin memorial, the most characteristic and impassioned of his non-literary work. He died on Jan. 28, 1881. His funeral was accompanied by an inspiring public demonstration.

The work that has made Dostoevski a world classic belongs to the last 17 years of his life. The series of his great novels is ushered in by *Letters from the Underworld* (1864) which may be considered as the central work of Dostoevski. It marks the crisis which changed him, from the humanistic idealist and dreamer of his early years, into the tragic creator of his full maturity. As in his great novels, the main subject is the problem of human liberty and of the justification of God and the World Order. The great novels that followed were *Crime and Punishment* (1866), *The Idiot* (1868-69), *The Demons* (1871, Eng. version *The Possessed*) and *The Brothers Karamazov* (1880), to which must be added *The Gambler* (1867), *The Eternal Husband* (1870), *A Raw Youth* (1875) and some shorter pieces included in *An Author's Diary*. These last, though much shorter, are sometimes of first-rate importance for the understanding of Dostoevski (especially *Bobok* and *The Dream of a Quaker Fellow*). In these works Dostoevski gave his full measure as one of the greatest novelists of all times, and as a personality of exceptionally deep significance. For psychological imagination, for power of dramatic construction, for the convincingness and reality of his characters he has no equals. As a thinker, we have to distinguish between the "Christian and national" element of his journalistic writings and of the less inspired parts of his novels (viz., the preachings of Father Zossima in *The Brothers Karamazov*), and the profound Jobean and Promethean questioner of the main great novels, whose only peers in modern times are Pascal and Nietzsche. His influence on Russian literature was greatest between 1895 and 1915. His ideas always loomed larger than his imaginative creation. Europe began to show a passionate interest in him from about 1905. His influence on French, German and English literature within the last 20 years has been considerable.

BIBLIOGRAPHY—*The Novels of Fyodor Dostoevsky*, trans. by Constance Garnett, 12 vols (1912-20). Separate works translated are *The House of the Dead* (1911), *Crime and Punishment* (1911), *Letters from the Underworld* (1913), *The Idiot* (1914), *Poor Folk and the Gambler* (1915), *Sister's Confession*, trans. S. S. Kotliarski and Virginia Woolf (1922), *The Brothers Karamazov* (1922), *Papers from the Journal of an Author* trans. by S. S. Kotliarski and J. DOETHAN, a city in the extreme southeastern part of Alia bama, U.S., the county seat of Houston county. It is on federal highways 84, 231 and 241, and is served by the Atlanta and St. Andrews Bay, the Atlantic Coast Line and the Central of Georgia railways. Pop. (1950) 21,556, (1940) 17,194, by the federal census. Doethan is the centre of a profitable farming and stock raising region. The Orangeburg and Norfolk soils drain well and encourage a high state of cultivation. A number of small diversified manufacturing industries are located in Doethan. The city was founded in 1884 and incorporated in 1885.

DOUAI, a town of northern France, capital of an arrondissement in the department of Nord, 20 mi S. of Lille on the Northern railway between that city and Cambrai. Pop. (1946), 37,258. Douai, the site of which was occupied by a castle (*Castrum Duacense*) as early as the 7th century, belonged in the middle ages to the counts of Flanders, passed in 1384 to the dukes of Burgundy, and so in 1477 with the rest of the Netherlands to Spain. In 1667 it was captured by Louis XIV, and was ceded to France by the treaty of Utrecht in 1713. Historically Douai is

important as the centre of the political and religious propaganda of the exiled English Roman Catholics. In 1562 Philip II of Spain founded a university here, in which several English scholars were given chairs, and in connection with this William Allen (*q.v.*) in 1568 founded the celebrated English college. It was here that the "Douai Bible" was prepared. There were also an Irish and a Scots college and houses of English Benedictines and Franciscans. All these survived till 1793, when the university was suppressed. The modern university is at Lille. Douai stands in a marshy plain on the banks of the Scarpe which supplies water to a canal on the west. The old fortifications, of which the Porte de Valenciennes (15th century) survives are now boulevards and gardens. The industrial towns of Dornignies, Sin Noble and Amiche are practically suburbs of Douai. The church of Notre Dame (12th and 14th centuries) possesses a fine altar piece (early 16th century) of wooden panels painted by Jean Bellegambe of Douai. The handsome hotel de ville, partly of the 15th century, has a lofty belfry. The Palais de Justice (18th century) was formerly the town house (*refuge*) of the abbey of Marchiennes. Houses of the 16th, 17th and 18th centuries are numerous. The municipal museum contains a good library, and a fine collection of sculpture and paintings but was damaged in World War I.

Douai is the seat of a court of appeal, a court of assizes and of a subprefect and has a tribunal of first instance, a board of trade arbitrators, an exchange, a chamber of commerce and a branch of the Bank of France. Its educational institutions include a lycée, training colleges, a school of mines, an artillery school, schools of music, agriculture, drawing, architecture, etc. and a national school for instruction in brewing and other industries connected with agriculture. In addition to other iron and engineering works, Douai has a large cannon foundry and an arsenal, coal mining and the manufacture of glass bottles and chemicals are carried on on a large scale in the environs, among the other industries are flax spinning, ropemaking and the manufacture of farm implements, oil and sugar. Trade, which is largely water-borne, is in grain and agricultural products, coal and building material.

See F. Brusaert, *Hist du château et de la chapelle de Douai* (Douai, 1877-87); C. Mine, *Hist pop de Douai* (ib 1861); B. Ward, *Down of the Catholic Revival* (London, 1909); Handecœur, *Hist du Collège anglais, Douai* (Reims, 1898); Daucolme, *Établissements britanniques à Douai* (Douai, 1881).

DOUARNENEZ, a fishing-port of western France, in the department of Finistère, on the southern shore of the Bay of Douarnenez 15 mi NW of Quimper by rail. Pop. (1936), 10,556. About 800 boats, and between 3,000 and 4,000 men, carry on the sardine fishery from June to December, and the preserving of the fish is an important industry. Mackerel and tunny fishing, boat-building and rope and net making also occupy the inhabitants. There is a lighthouse on the small island of Tristan off Douarnenez.

DOUBLE, twice as much, or large, having two parts, having a part repeated (from the Mid Eng *double*, through the Old Fr *double*, from Lat *duplus*, twice as much). The word appears as a substantive with the special meaning of the appearance to a person of his own apparition, generally regarded as a warning, or of such an apparition of one living person to another, the German *Doppelgänger* (See APPARITIONS). "Double" is also used of a person whose resemblance to another is peculiarly striking or remarkable, so that confusion between them may easily arise.

Double or doubles, in music, is an old and now obsolete term for instrumental variations, derived possibly from the fact that more often than not each succeeding variation "doubled" the notes of the preceding one, two quavers taking the place of one crotchet, and so on. The word "doubles" is also applied in bell-ringing terminology to a "change" in which two pairs of bells change places.

DOUBLE BASS, the largest member of the violin family and the lowest in pitch (Fr *contrebasse*, Ger *Kontrabass*, Gross Bass Geige; Ital *contrabbasso*, *violone*). The double bass differs slightly in construction from the other members of the family in that it has more slanting shoulders (one of the features of the *viola da gamba*, see VIOLIN). Formerly, too, the double bass was made with a flat back—another characteristic of the viol family—

whereas now the back is as often found arched as flat.

The technique of the double bass presents certain difficulties inherent in an instrument of such large proportions. The stretches for the fingers are very great, almost double those required for the violoncello, and owing to the thickness of the strings great force is required to press them against the finger board when they are vibrating.

The double bass sometimes has three strings tuned, in England and Italy in fourths , in France and Germany

in fifths  the real sounds being an octave lower.

Owing to the scoring of modern composers, however, it was found necessary to adopt an accordance of four strings in order to obtain the additional lower notes required, although this entailed the sacrifice of some beauty of tone, the three stringed instrument being more sonorous. The four strings are tuned in fourths .

The practical compass of the double bass

extends from  (real sounds) with all chromatic

DOUBLE BASS LAST SURVIVING
REPRESENTATIVE OF THE EARLIER
VIOLS

These opening bars are played *solo* by cellos and double basses, a daring innovation of Beethoven's which caused quite a consternation at first in musical circles. Still more striking is the famous passage, suggesting the gambols of an elephant, which the double basses are called on to play at the opening of the trio of the same movement.

The remote origin of the double bass is the same as that of the violin. It was evolved from the bass viols, though whether the transformation took place simultaneously with that of the violin from the treble viol, or preceded it, has not been definitely proved.

Giovanni Bottesini (1822-89) was the greatest virtuoso on the double bass that the world has ever known. Before him, Domenico Dragonetti (1763-1846) also enjoyed great fame, while more recently Kussevitsky, who later exchanged the bow for the bâton and became a world renowned conductor, was for some years a leading exponent of the instrument.

DOUBLE ENTRY—see BOOKKEEPING

DOUBLE FUGUE, in music, a fugue with two subjects, worked together or interwoven (See FUGUE.)

DOUBLE JEOPARDY The 5th Amendment to the U.S. Constitution provides no one shall be "twice put in jeopardy" no one punished or acquitted of an offense may be retried

DOUBLE LIABILITY, in the United States, applies to the stockholders' liability in certain corporations, signifying that, in case of insolvency, the stockholders may not only lose the amount which they invested in their stock but may also be called upon ratably for the concern's indebtedness up to an additional amount equal to the full par value of the stock. This double liability does not apply to stocks of ordinary business corporations but to banking corporations. The laws of most States make State chartered banks subject to double liability, and the national banking laws make double liability apply to the stock of national banks. The national bank act in providing for double liability on national bank stock provides "except that shareholders of any banking association now existing under state laws having not less than five million dollars of capital actually paid in and a surplus of twenty per centum on hand, both to be determined by the Comptroller of the Currency, shall be liable only to the amount invested in their shares." At the time of the passage of the act, the National Bank of Commerce of New York city met the above requirements and so its stock became the exception to the double liability for national banks

DOUBLE-NAME PAPER, notes, bills of exchange or acceptances bearing two names, each of which represents a separate interest and each of which is responsible for the payment. The names may represent a signature and an endorsement, or two signatures. The former class is often known as endorsed paper, and both classes are commonly known as two name paper. Trade acceptances and bankers' acceptances necessarily have two or more names and both the drawer and the acceptor are liable for the payment (See ACCEPTANCE, BILL OF EXCHANGE, NOTE, DRAFT)

DOUBLE REFRACTION, the resolution, on entering a non-isotropic medium, of light into two rays travelling with different velocities (See LIGHT)

DOUBLE STAR see BINARY SYSTEM AND STAR

DOUBLE-STOPPING, a musical term signifying the playing of two notes simultaneously on a stringed instrument of the violin family. In strictness the term should not be applied when one of the notes is an "open" one and has therefore not entailed any "stopping," i.e., pressing down of the string against the fingerboard by the finger, whereby its vibrating length is shortened, but in practice the distinction is not observed.

DOUBLET, a close fitting garment, with or without sleeves, extending from the neck to a little below the waist, worn from the 14th century to the time of Charles II, when it began to be superseded by coat and waistcoat. The doublet was introduced into England from France, and was originally padded for defence or warmth. "Doublet" is also used of a pair or couple, as in philology, one of two words differing in form, but represented by an identical root, e.g. "alarm" or "alarum", in optics, of a pair of lenses, combined to correct aberration. In the work of the lapidary a doublet is a counterfeit gem, made by cementing two pieces of plain glass or crystal on each side of a layer of glass

(The following is a list of the names of the various doublets, as given in the original text, but they are not legible due to the quality of the scan.)

DOUBS, a river of eastern France, rising in the Jura at the foot of the Noirmont ridge, at a height of 3,074 ft., and flowing into the Saône. It is 269 m. long, though, owing to the fact that it doubles back upon itself, the distance from source to mouth in a direct line is only 56 miles. Its basin has an area of 3,020 sq. miles. The river begins by flowing north east and traverses the Lake of St. Point and passes Pontarlier. Thenceforth its course lies chiefly through wooded limestone gorges of great grandeur. After skirting the town of Morteau, below which it expands into the Lake of Challexon and descends over the Fall of the Doubs (88 ft.), the river for about 28 m. forms the frontier between France and Switzerland. It flows in the latter country for some distance and then turns abruptly westward. Thus far the Doubs has been flowing between the folds of the Jura, but when it comes against the shattered southern face of the old block of the Vosges its course is rapidly altered. After turning westward it finds its way through this complicated country by turning north, and finally, at Voujaucourt, south-west. Below that town the river is joined by the canal from the Rhone to the Rhine, to accommodate which its course has been canalized as far as Dôle. The Doubs passes Clerval and Baume-les-Dames to Besançon. The lower section of its course is in the great

while the rest of the department is traversed by the remaining three mountain ranges, the highest and most easterly of which contains the Mont d'Or (4,800 ft.). Besides the Doubs the chief rivers are its tributaries, the Dessoubre, watering the east of the department, and the Loue its south western portion. The climate is in general cold and rainy, and the winters are severe. The soil is stony and loamy, and at the higher levels there are many peat-bogs. In its agricultural aspect the department may be divided into three regions. The highest, on which the snow usually lies from six to eight months in the year, is in part barren, but on its less exposed slopes is occupied by forests of fir trees, and affords good pasturage for cattle. In the second or lower region the oak, beech, walnut and sycamore flourish, and the valleys are capable of cultivation. The region of the plain is the most fertile, and produces all kinds of cereals as well as hemp, vegetables, vines and fruit. Cattle rearing and dairy-farming receive much attention, large quantities of cheese, of the nature of Gruyère, are produced, mainly by the co-operative cheese factories or *franchises*. The rivers of the department abound in gorges and falls of great beauty. The most important manufactures are watches, made chiefly at Besançon and Morteau, hardware (Hermoncourt and Valentigney), and machinery. Large iron foundries are found at Audincourt (pop. 9,308) and other towns. Distilling and the manufacture of cotton and woolen goods, automobiles and paper are also carried on. Exports include watches, live-stock, wine, vegetables, iron and hardware, cattle, hides, timber, coal, wine and machinery are imported. Large quantities of goods, in transit between France and Switzerland, pass through the department. Among its mineral products are building stone, rock salt and lime, and there are peat workings. Doubs is served by the Paris-Lyon railway, the line from Dole to Switzerland passing, via Pontarlier, through the south of the department. The canal from the Rhône to the Rhine traverses it for 84 miles.

The department of Doubs is divided into the *arrondissements* of Besançon, Baume les-Dames, Montbéliard and Pontarlier, with 27 cantons and 636 communes. It belongs to the *académie* (educational circumscription) and the diocese of Besançon, which is the capital, the seat of an archbishop and of a court of appeal, and headquarters of the VII army corps. Besides Besançon, the chief towns are Montbéliard and Pontarlier (q.v.). Ornans, a town on the Loue, has a church of the 16th century and ruins of a feudal castle. Montbenoit on the Doubs near Pontarlier has the remains of an Augustine abbey (11th to 16th centuries), the cloisters are of the 15th century, and the church contains fine 16th century stalls. Morteau has the Maison Pottier, of the Renaissance period. Baume-les-Dames owes the affix of its name to a Benedictine convent founded in 763, to which only noble ladies were admitted. Numerous antiquities have been found at Mandeuve (near Montbéliard), on the site of the Roman town of *Epomandunodurum*.

DOUBS, a river of eastern France, rising in the Jura at the foot of the Noirmont ridge, at a height of 3,074 ft., and flowing into the Saône. It is 269 m. long, though, owing to the fact that it doubles back upon itself, the distance from source to mouth in a direct line is only 56 miles. Its basin has an area of 3,020 sq. miles. The river begins by flowing north east and traverses the Lake of St. Point and passes Pontarlier. Thenceforth its course lies chiefly through wooded limestone gorges of great grandeur. After skirting the town of Morteau, below which it expands into the Lake of Challexon and descends over the Fall of the Doubs (88 ft.), the river for about 28 m. forms the frontier between France and Switzerland. It flows in the latter country for some distance and then turns abruptly westward. Thus far the Doubs has been flowing between the folds of the Jura, but when it comes against the shattered southern face of the old block of the Vosges its course is rapidly altered. After turning westward it finds its way through this complicated country by turning north, and finally, at Voujaucourt, south-west. Below that town the river is joined by the canal from the Rhone to the Rhine, to accommodate which its course has been canalized as far as Dôle. The Doubs passes Clerval and Baume-les-Dames to Besançon. The lower section of its course is in the great

structural depression between the Cote d'or and the Jura. After passing Dôle it leaves the high ground and enters the plain of the Saône. Here it receives the waters of the Loue, which also has a complicated structural history, finding its way, like the Doubs, between the outer folds of the Jura—sometimes parallel with them and sometimes cutting across them, and finally falling into the great structural depression with the lower Doubs and Saône. The Doubs reaches the Saône at Verdun sur le-Doubs. The river is navigable only for approximately 8 miles above its mouth.

DOUCE, FRANCIS (1755–1834), English antiquary, was born in London. He interested himself in antiquities, and was for a short time keeper of manuscripts in the British Museum. He left his books, illuminated manuscripts, coins, etc., to the Bodleian library, his own manuscript works to the British Museum, but they were returned, and his printings, carvings and miscellaneous antiquities to Sir Samuel Meyrick, who published an account of them, entitled *The Doucean Museum*. His published works are *Illustrations of Shakespeare and Ancient Manners* (2 vols., 1807), and *Dissertation on the Various Designs of the Dance of Death* (1833), the substance of which had appeared forty years before. He also contributed a considerable number of papers to the *Archæologia* and *The Gentleman's Magazine*.

DOUGHBOY, in the 17th century, signified "dumpling." During the American Civil War it was applied to the mass buttons on uniforms and thence to infantrymen. At a period not exactly ascertained the word was supposed to come from the dough like appearance of a uniform soiled by moistened pipe clay. Again, infantrymen were said to march in "dough" during wet weather. "Adobe" furnishes a similar derivation, although it may be a "popular etymology," or wholesale transference of a foreign word to an English meaning and spelling. "Doughboys" was a favourite designation for the United States soldiers during the World War. See J. H. Moss, *Officers' Manual* (1909), G. P. Krapp, *The English Language in America* (2 vols., 1936).

DOUGHERTY, PAUL (1877–1947), American painter, was born at Brooklyn (N.Y.), on Sept. 6, 1877. He was educated at the Brooklyn Polytechnic Institute and the New York Law School, where he took the degree of LL.B. in 1898. He then spent five years in Europe, devoting himself to the study of art. His first picture was exhibited at the Paris Salon in 1901. He was chiefly concerned with marine subjects, in which he achieved great success, being awarded the Osborne Prize (1906), the Inness Gold Medal and the Carnegie Prize, National Academy of Design (1913), the gold medal at the San Francisco exposition (1915), and the Altman Prize (1918). Among his more important pictures are "October Seas," "The Road to Cayey," and "Lake Louise," in the Metropolitan Museum, New York City, "The Land and the Sea," in the Corcoran gallery, Washington, "Flood Tide," in the Carnegie Institute, Pittsburgh, "Moonlight Cove," in the Toledo museum, "Sun and Storm," in the National gallery, Washington, and "A Freshening Gale," in the Albright Art gallery, Buffalo. He died on Jan. 9, 1947, at Palm Springs, Calif.

DOUGHTY, SIR ARTHUR GEORGE (1860–1936), Canadian historian and archivist, was born March 27, 1860, at Maidenhead, England, educated at Oxford, and Dickinson college, Carlisle, Pa. He went to Montreal as a journalist and private secretary, becoming in 1901 joint librarian of the provincial records office, and in 1904 Dominion archivist and keeper of the records. He was appointed deputy minister in 1912, in which year he also became joint editor, with Adam Shortt, of the series, *Canada and its Provinces*. His chief works are *Tenison* (1893), *Siege of Quebec* (6 vols., 1901), *Documents Relating to the Constitutional History of Canada* (1907–18), *The Cradle of New France* (1908), *The Acadia Exiles* (1915), and *The Canadian Archives and its Activities* (1924).

DOUGHTY, CHARLES MONTAGU (1843–1926), British traveller and writer, younger son of the Rev. C. M. Doughty of Theberton Hall, Suffolk, was born on Aug. 19, 1843. He was prevented by an impediment in speech from entering the navy, and his education was continued at King's college, London, and at Caius and Downing colleges, Cambridge, where he graduated in

natural science in 1865. He turned then to independent travel and study, freely adventuring in his chosen fields of geology, archaeology and philology. And he did so in no half-hearted way. In Norway, Oxford, Leyden, Louvain, Italy, Spain, North Africa and Greece he served a long novitiate in wandering and scholarship which led him at last to Syria, Palestine and his adventures in Arabia.

In Nov. 1876 Doughty set out from Damascus with a pilgrim caravan. At Madain Sâh he left the Hajj, and surveyed the Al-Hajr monuments and inscriptions. He then decided to reach independently the oasis of Khairah, and to this end attached himself to wandering Bedouins. Dependent on their movements, his dangers were now multiplied and his life was repeatedly endangered by the inevitable suspicion, fanaticism and treachery which on occasion broke through the respect and hospitality which Doughty's courageous personality compelled. He reached Khairah from Tama in the summer of 1877, was sent back to Hail, thence to Al-Qasim, Buraidah and Anazir. From there, after some months, he travelled southwards towards Mecca and reached safely at Jidda in Aug. 1878. The story of this great journey, which threw many fresh lights on the geology, hydrography and ethnology of Arabia, Doughty told in *Travels in Arabia Deserta* (1888, abridged edition 1926). Doughty was less concerned to produce a chronicle or work of information than to create, out of his unique experience, an unique monument of what he considered pure English prose. To him, this meant the achievement of an Elizabethan directness of utterance and the renunciation of all post-Elizabethan growths in syntax and vocabulary. He succeeded. His profound literary sense had told him aright when it inspired him to treat his remote and lonely adventuring in this bare, majestic style.

The later years of Doughty's life, mostly spent in England, were given over to poetry. Essentially, indeed, he was always a poet, in his deep comprehension of the values of words no less than in his power of penetrating into the living past, whether of a country's physical structure or of its people and their life. Fourteen years' labour produced his epic, *The Dawn in Britain* (1906), his other long poems and poetic dramas including *The Cliffs* (1909), *The Clouds* (1912), *The Titans* (1916) and *Man-soul* (1920, new edition 1923). Like *Arabia Deserta*, the poems he wrote reflect his Elizabethan predilections. He died at Sissinghurst, Kent, on Jan. 20, 1926. (J. H. M.)

DOUGHTY-WYLIE, CHARLES HOTHAM MONTAGU (1868–1915), British soldier and consul, was born at Lenston, Suffolk, on July 23, 1868, and was educated at Winchester and Sandhurst, from which he passed into the Royal Welch Fusiliers in 1889. He was on active service in India in the Hazara (1891) and Chitral (1895) campaigns. He also served with great distinction in the Egyptian campaign of 1898, in the Boer War, in the China Field Force (1901), and as special service officer in Somaliland. But the field in which his remarkable force of character was most clearly shown was in the Near East. In Sept. 1906 Doughty-Wylie was appointed military consul at Konieh, in Anatolia, and in 1909 Cilicia was added to his area. In that year an attempted massacre of the Christian population of Adana was stopped by his courage and quickness, when he collected a small group of Turkish regulars, and saved the Armenian quarter. The next four years were spent as consul at Addis Ababa, Abyssinia, but the outbreak of war brought him back to England. He was attached to Sir Ian Hamilton's staff for the Gallipoli expedition, and went ashore with the first batch of troops on the "River Clyde." His gallant exploit on V Beach on April 26, 1915, when he captured Hill 141 in hand-to-hand fighting, cost him his life. Doughty-Wylie was buried on the spot.

See an article, based on personal knowledge, by D. G. Hogarth, in the *Diet Nat. Bug Supp.* 1912–21 (1927).

DOUGLAS, the name of a Scottish noble family, now represented by the dukes of Hamilton (Douglas-Hamilton, heirs male), the earls of Home (Douglas-Home) who also bear the title of Baron Douglas of Douglas, the dukes of Buccleuch and Queensberry (Montagu Douglas-Scott), the earls of Morton (Douglas), the earls of Wemyss (Wemyss-Charteris Douglas),

and the baronets Douglas of Carr, of Springwood, of Glenhervie, etc. The marquessate of Douglas and the earldom of Angus, the historic dignities held by the two chief branches of the family, the Black and the Red Douglas, are merged in the Hamilton peerage. The name represented the Gaelic *dubh glas*, dark water, and Douglasdale, the home of the family in Lanarkshire, is still in the possession of the earls of Home. The first member of the family to emerge with any distinctness was William de Douglas, or Douglass, whose name frequently appears on charters from 1175 to 1213. He is said to have been brother, or brother-in-law, of Freskin of Murray, the founder of the house of Murray. His second son, Bruce (d. 1222), became bishop of Moray, while the estate fell to the eldest, Sir Archibald (died c. 1240).

SIR WILLIAM OF DOUGLAS (d. 1298), called "*le hardi*," Archibald's grandson, first formally assumed the title of lord of Douglas. He gave a grudging allegiance to John de Baliol, and swore fealty to Edward I. in 1291, but when the Scottish barons induced Baliol to break his bond with Edward I. he commanded at Berwick Castle, which he surrendered after the sack of the town by the English in 1296. After a short imprisonment Douglas was restored to his Scottish estates on renewing his homage to Edward I., but his English possessions were forfeited. He joined Wallace's rising in 1297, and died in 1298, a prisoner in the Tower of London.

His son, SIR JAMES OF DOUGLAS (1286-1330), lord of Douglas, called the "Good," was educated in Paris. On his return he found an Englishman, Robert de Clifford, in possession of his estates. His offer of allegiance to Edward I. being refused, he cast in his lot with Robert Bruce, whom he joined before his coronation at Scone in 1306. From the battle of Methven he escaped with Bruce and the remnant of his followers, and accompanied him in his wanderings in the Highlands. In the next year they returned to the south of Scotland. He twice outwitted the English garrison of Douglas and destroyed the castle. One of these exploits, carried out on Palm Sunday, March 19, 1307, with barbaric excesses even in those days, is known as the "Douglas Larder." Douglas routed Sir John de Mowbray at Ederford Larder, near Kilmarnock, and was entrusted with the conduct of the war in the south, while Bruce turned to the Highlands. He made many successful raids on the English border, which won for him the dreaded name of the "Black Douglas" in English house holds. Through the capture of Roxburgh Castle in 1314 by stratagem, the assaults being disguised as black oxen, he secured Teviotdale, and at Bannockburn, where he was knighted on the battlefield, he commanded the left wing with Walter the Steward. During the 13 years of intermittent warfare that followed he repeatedly raided England. He slew Sir Robert de Nevill, the "Peacock of the North," in single combat in 1316, and in 1319 he invaded Yorkshire, in company with Randolph, defeating an army assembled by William de Melton, archbishop of York, at Mitton-on-Swale (Sept. 20), in a fight known as "The Chapter of Myton." In 1322 he captured the pass of Byland in Yorkshire, and forced the English army to retreat. He was rewarded by the "Emerald Charter," granted by Bruce, which gave him criminal jurisdiction over the family estates, and released the lords of Douglas from various feudal obligations. In a daring night attack on the English camp in Weardale in 1327 Douglas came near capturing Edward III. himself. After laying waste the northern coun-

try of Douglas. The inheritance fell to his brother, a churchman, Hugh the "Dull" (b. 1294), who surrendered his lands to David II., and a regrant was made to William Douglas, next referred to.

WILLIAM DOUGLAS, 1ST EARL OF DOUGLAS (c. 1327-1384) had been educated in France, and returned to Scotland in 1348. In 1353 he killed in Ettrick forest his kinsman, William, the knight of Liddesdale (c. 1300-1353), known as the "Flower of Chivalry," a descendant of a younger son of the original William de Douglas. Some of the Liddesdale lands fell to his kinsman and murderer, who was created earl of Douglas in 1358. In 1357 his marriage with Margaret, sister and heiress of Thomas, 13th earl of Mar, eventually brought him the estates and the earldom of Mar. He was one of the securities for the payment of David II.'s ransom, and in consequence of the royal misappropriation of some moneys raised for this purpose, Douglas was for a short time in rebellion in 1363. In 1364 he joined David II. in seeking a treaty with England which should deprive Robert the Steward, formerly an ally of Douglas, of the succession by putting an English prince on the Scottish throne. The independence of Scotland was to be guaranteed, and a special clause provided for the restoration of the English estates of the Douglas family. On the accession of Robert II. he was nevertheless reconciled, becoming justiciar of southern Scotland, and the last years of his life were spent in making and repelling border raids. He died at Douglas in May 1384, and was succeeded by his son James. By his wife's sister-in-law, Margaret Stewart, countess of Angus in her own right, and widow of the 13th earl of Mar, he had a son George, afterwards 1st earl of Angus.

JAMES, 2ND EARL OF DOUGLAS AND MAR (c. 1358-1388), married Lady Isabel Stewart, daughter of Robert II. In 1385 he made war on the English with the assistance of a French contingent under John de Vienne. He allowed the English to advance to Edinburgh, wisely refusing battle, and contented himself with a destructive counter-raid on a skirmish near Newcastle. Percy captured Hotspur Percy's person in the castle near Newcastle. Percy sought revenge in the battle of Otterburn (Aug. 1388), which ended in a victory for the Scots and the capture of Hotspur and his brother, though Douglas fell in the fight. The struggle narrated by Froissart, is celebrated in the English and Scottish ballads called "Chevy Chase" and "The Battle of Otterburn." The 2nd earl left no legitimate male issue. His natural sons William and Archibald became the ancestors of the families of Douglas of Drumlinrig (see QUEENSHERRY EARLS, MARQUESSSES AND DUKES OF) and Douglas of Cavers. His sister Isabel became countess of Mar inheriting the lands of Mar and his unentailed estates.

The earldom and entailed estates of Douglas reverted by the patent of 1358 to ARCHIBALD DOUGLAS, 3RD EARL OF DOUGLAS, called "The Grim" (c. 1328-c. 1400), a natural son of the "good" Sir James. He was warden of the western marches, lord of Galloway in 1369, increased his estates by his marriage with Joanna Moray, heiress of Bothwell, and by his purchase of the earldom of Wigton in 1372. During the intervals of war with the English he imposed feudal law on the border chieftains, drawing up a special code for the marches. He was twice sent on missions to the French court. The power of the Black Douglas overshadowed the Crown under the weak rule of Robert III., and in 1399 he arranged a marriage between David, duke of Rothesay, the king's son and heir, and his own daughter, Marjory Douglas. A natural son of Archibald, Sir William of Douglas, lord of Nithsdale (d. 1392), married Egidia, daughter of Robert III.

Archibald the Grim was succeeded by his eldest son ARCHIBALD, 4TH EARL OF DOUGLAS, 1st duke of Touraine, lord of Galloway and Annandale (1369?-1424), who married in 1390 Lady Margaret Stewart, eldest daughter of John, earl of Carrick, afterwards King Robert III. In 1400 March and Hotspur Percy had laid waste eastern Scotland as far as Lothian when they were defeated by Douglas (the master of Douglas) near Pits on. With the regent, ROBERT, duke of Albany, he is suspected of conspiracy in the murder (March 1402) of David duke of Rothesay, who was in their custody at Falkland Castle but who was actually declared guilty by the parliament. In the year Douglas raided England and was taken prisoner at Homildon Hill by the Percys. He

His half-brother, Sir Archibald, created Edward Baliol at Annan in 1332, and had just been appointed regent of Scotland for David II. when he was risked a pitched battle at Halidon Hill, where he was defeated and killed (1333), with his nephew William, lord

fought on the side of his captors at Shrewsbury (1403), and was taken prisoner by the English king, Henry IV. He became reconciled, during his captivity, with the earl of March, whose lands had been conferred on Douglas, but were now, with the exception of Annandale, restored. He returned to Scotland in 1409, but was in constant communication with the English court for the release of the captive king, James I. In 1412 he had visited Paris, when he entered into a personal alliance with John the Fearless, duke of Burgundy, and in 1423 he commanded a contingent of 10,000 Scots sent to the help of Charles VII against the English. He was made lieutenant general in the French army, and received the peerage duchy of Touraine with remainder to his heirs male. The new duke was defeated and slain at Verneuil (1424) with his second son, James, his persistent ill-luck earned him the title of the Tyne-man (the loser).

ARCHIBALD, 5TH EARL OF DOUGLAS (c. 1391-1439), succeeded to his father's English and Scottish honours, though he never touched the revenues of Touraine. He fought at Baugé in 1421, and was made count of Longueville in Normandy.

His two sons, WILLIAM, 6TH EARL (1423?-1440), and David, though they were little more than boys at the time of their father's death in 1439, were summoned to court by Sir William Crichton, lord chancellor of Scotland, on Nov. 24, 1440, and, after a mock trial in the young king's presence, were beheaded forthwith in the courtyard of Edinburgh Castle. This murder broke up the dangerous power wielded by the Douglasses. The lordships of Annandale and Bothwell fell to the Crown, Galloway to the earl's sister Margaret, the "Fair Maid of Galloway", while the Douglas lands passed to his great-uncle JAMES DOUGLAS, 7TH EARL OF DOUGLAS, called the "Grose", of Balvany (1371-1444), lord of Abercorn and Aberdour, earl of Avondale (c. 1437), younger son of the 3rd earl.

The latter's sons, WILLIAM (c. 1425-1452) and JAMES (1426-1488), became 8th and 9th earls respectively. Archibald became earl of Moray by marriage with Elizabeth Dunbar, daughter and co-heiress of James, earl of Moray. Hugh was created earl of Ormond in 1445, John was lord of Balvany, Henry became bishop of Dunkeld.

The power of the Black Douglasses was restored by the 8th earl, who recovered Wigton, Galloway and Bothwell by marriage (by papal dispensation) with his cousin, the Fair Maid of Galloway. He was soon high in favour with James II, and procured the disgrace of Crichton, his kinsmen's murderer, by an alliance with his rival, Sir Alexander Livingstone. In 1450 James raided the earl's lands during his absence on a pilgrimage to Rome, but their relations seemed outwardly friendly until, in 1452, the king invited Douglas to Stirling Castle under a safe conduct, in itself, however, a proof of strained relations. There James demanded the dissolution of a league into which Douglas had entered with Alexander Lindsay, the "Tiger" earl (13th) of Crawford. On Douglas's refusal the king murdered him (Feb. 22) with his own hands, the courtiers helping to despatch him. The tales of the hanging of Sir Herbert Herries of Terregles and the murder of McLellan of Bombie by Douglas rest on no sure evidence.

JAMES DOUGLAS, 9TH EARL (and last), denounced his brother's murderers and took up arms, but was obliged by the desertion of his allies to submit. He obtained a papal dispensation to marry his brother's widow, in order to keep the family estates together. He intrigued with the English court, and in 1455 rebelled once more. Meanwhile another branch of the Douglas family, known as the Red Douglas, had risen into importance (see ANGUS, EARLS OF), and George Douglas, 4th earl of Angus (d. 1463), great-grand son of the 1st earl of Douglas, took sides with the king against his kinsmen. James Douglas, again deserted by his chief allies, fled to England, and his three brothers, Ormond, Moray, and Balvany, were defeated by Angus at Arkinholm on the Esk. Moray was killed, Ormond taken prisoner and executed, while Balvany escaped to England. Their last stronghold, the Threave in Galloway, fell, and the lands of the Douglasses were declared forfeit, and were divided among their rivals, the lordship of Douglas falling to the Red Douglas, 4th earl of Angus. In England the earl of Douglas was employed by Edward IV. In 1461 to negotiate

a league with the western highlanders against the Scottish kingdom. In 1484 he was taken prisoner while raiding southern Scotland, and was relegated to the abbey of Lindores where he died in 1488.

The title of Douglas was restored in 1633 when WILLIAM, 11th earl of Angus (1589-1660), was created 1ST MARQUESS OF DOUGLAS by Charles I. In 1645 he joined Montrose at Philiphaugh and was imprisoned in 1646 at Edinburgh Castle, only obtaining his release by signing the Covenant. His eldest son, Archibald, created earl of Ormond, Lord Bothwell and Hartside, in 1651, predeceased his father, Lord James Douglas (c. 1617-1645) and his half-brother, Lord George Douglas (c. 1636-1692), created earl of Dumbarton in 1675, successively commanded a Scots regiment in the French service. William (1635-1694), created earl of Selkirk in 1646, became 3rd duke of Hamilton after his marriage (1656) with Anne, duchess of Hamilton in her own right. By the failure of heirs in the elder branches of the family the dukes of Hamilton (q.v.) became heirs male of the house of Douglas.

JAMES DOUGLAS, 2ND MARQUESS OF DOUGLAS (1646-1700), succeeded his grandfather in 1660. His eldest son, John, by courtesy earl of Angus, raised a regiment of 1,200 men, first known as the Angus regiment, later as the Cameronians (26th Foot). He was killed at its head at Steinkirk in 1692. The younger son, ARCHIBALD, 3RD MARQUESS (1694-1761), was created duke of Douglas in 1703, but the dukedom became extinct on his death, without heirs, in 1761. He was a consistent supporter of the Hanoverian cause, and fought at Sheriffmuir. The heir presumptive to the Douglas estates was his sister, Lady Jane Douglas (1698-1753), who in 1746 secretly married Colonel, afterwards Sir, John Stewart of Grandtully, by whom she had twin sons, born in Paris in 1745. These children were alleged to be spurious, and when Lady Jane and the younger of the two boys died in 1753, the duke refused to acknowledge the survivor as his nephew, but in 1760 he was induced, under the influence of his wife, to revoke a will devising the estates to the Hamiltons in favour of Lady Jane's son, Archibald James Edward Stewart (1748-1827), 1st Baron Douglas of Douglas (c. 1790) in the British peerage. The inheritance of the estates was disputed by the Hamiltons, representing the male line, but the House of Lords decided in favour of Douglas in 1769. Three of his sons succeeded Archibald Douglas as Baron Douglas, but as they left no male issue the title passed to the earls of Home, Cospatrick Alexander, 11th earl of Home, having married a granddaughter of Archibald, 1st Baron Douglas. Their descendants, the earls of Home, represent the main line of Douglas on the female side.

BIBLIOGRAPHY—David Hume of Godscroft (1607-1630), who was secretary to Archibald Douglas, 8th earl of Angus, wrote a *History of the House and Race of Douglas and Angus*, printed under his daughter's superintendence (Edinburgh, 1644). He was a partial historian, and his account can only be accepted with caution. Modern authorities are Sir William Fraser, *The Douglas Book* (4 vols., Edinburgh, 1885), and Sir H. Maxwell, *History of the House of Douglas* (3 vols., 1902). See also G. E. C. (Okayne)'s *Peerage*, and Douglas's *Scotts Peerage*, *Calendar of State Papers, Scottish Series*, *The Hamilton Papers*, etc.

DOUGLAS, SIR CHARLES WHITTINGHAM HORSLEY (1830-1914), British general, was born on July 17, 1830, at the Cape of Good Hope. Entering the army when 19, he saw service with the 92nd Highlanders in the Afghan War of 1879-80, in the Boer War of 1881, in the Sudan campaign of 1884 and in the South African War of 1899-1901. In 1895 he had been made deputy assistant adjutant-general at Aldershot, in 1898 he became a colonel, in 1904 adjutant general at the War Office and member of the new Army Council, in 1909 general officer commanding in chief, southern command, in 1910 full general, 1912 inspector-general, home forces, and in 1914 chief of the Imperial General Staff. Up to the time of his death on Oct. 25, 1914, he assisted Kitchener at the War Office.

DOUGLAS, DAVID (1798-1834), Scottish botanist, was born at Scone, Perthshire. After being a gardener at the botanical gardens of Glasgow, he went to Oregon in 1823 as a collector to the Royal Horticultural Society, in 1825 pushing on to British Columbia where he discovered many new plants, trees and birds, and in 1827 reaching Hudson Bay. From 1830 to 1834 he explored

California and the Fraser river region. He died in the Sandwich islands July 12, 1834. He introduced into Britain many trees, shrubs and plants and gave his name to the Douglas spruce.

DOUGLAS, GAVIN (1474?-1522), Scottish poet and bishop, third son of Archibald, 5th earl of Angus (called the "great earl of Angus" and "Bell the Cat"), was born c. 1474, probably at one of his father's seats. He was a student at St Andrews, 1489-94, and thereafter it is supposed at Paris. In 1496 he obtained the living of Monymusk, Aberdeenshire, and later he became parson of Lynton (*mod* Linton) and rector of Hauch (*mod* Prestonkirk), in East Lothian, and about 1501 was preferred to the deanery or provostship of the collegiate church of St Giles, Edinburgh, which he held with his parochial charges. From this date till the battle of Flodden, in Sept. 1513, he appears to have been occupied with his ecclesiastical duties and literary work. Indeed all the extant writings by which he has earned his place as a poet and translator belong to this period. After the disaster at Flodden he was completely absorbed in public business. Three weeks after the battle he, still provost of St Giles, was admitted a Burgess of Edinburgh, his father, the "Great Earl," being then civil provost of the capital. The latter dying soon afterwards (Jan. 1514) in Wigtownshire, where he had gone as justiciar, and his son having been killed at Flodden, the succession fell to Gavin's nephew Archibald (6th earl). The marriage of this youth to James IV's widow on Aug. 6, 1514 did much to identify the Douglases with the English party in Scotland, as against the French party led by Albany, and incidentally to determine the political career of his uncle Gavin. During the first weeks of the queen's sorrow after the battle, Gavin, with one or two colleagues of the council, acted as personal adviser, and it may be taken for granted that he supported the pretensions of the young earl. The first outcome of the new connection was his appointment to the abbacy of Aberbrothock by the queen regent, before her marriage, probably in June 1514. Soon after the marriage she nominated him archbishop of St Andrews, in succession to Elphinstone, archbishop-designate. But Hepburn, prior of St Andrews, having obtained the vote of the chapter expelled him, and was himself in turn expelled by Forman, bishop of Moray, who had been nominated by the pope. In the interval, Douglas's rights in Aberbrothock had been transferred to James Beaton, archbishop of Glasgow. The breach between the queen's party and Albany's had widened, and the queen's advisers had begun an intrigue with England, for the removal of the royal widow and her young son to Henry's court. In those deliberations Gavin Douglas took an active part, and for this reason stimulated the opposition which successfully thwarted his preference.

In Jan. 1515 on the death of George Brown, bishop of Dunkeld, the queen nominated him to the see, which he ultimately obtained, though not without trouble. For the earl of Athole had forced his brother, Andrew Stewart, prebendary of Craig, upon the chapter, and had put him in possession of the bishop's palace. The queen appealed to the pope and was seconded by Henry VIII, and the pope's sanction was obtained on Feb. 18, 1515. Some of the correspondence of Douglas and his friends incident to this transaction was intercepted. When Albany came from France and assumed the regency, these documents and the "purchase" of the bishopric from Rome contrary to statute were made the basis of an attack on Douglas, who was imprisoned in Edinburgh Castle, thereafter in the castle of St Andrews (under the charge of his old opponent, Archbishop Hepburn), and later in the castle of Dunbar, and again in Edinburgh. The pope's intervention procured his release, after nearly a year's imprisonment. The queen meanwhile had retired to England. After July 1516 Douglas appears to have been in possession of his see, and to have patched up a diplomatic peace with Albany.

On May 17, 1517 the bishop of Dunkeld proceeded with Albany to France to conduct the negotiations which ended in the Treaty of Rouen. He was back in Scotland towards the end of June. Albany's longer absence in France permitted the party-faction of the nobles to come to a head in a plot by the earl of Arran to seize the earl of Angus, the queen's husband. The issue of this plot was the well-known fight of "Clear-the-Causeway," in which

Gavin Douglas's part stands out in picturesque relief. The triumph over the Hamiltons had an unsettling effect upon the earl of Angus. He made free of the queen's rents and abducted Lord Traquair's daughter. The queen set about to obtain a divorce, and used her influence for the return of Albany as a means of undoing her husband's power. Albany's arrival in Nov. 1521, with a large body of French men-at-arms, compelled Angus, with the bishop and others, to flee to the Borders. From this retreat Gavin Douglas was sent by the earl to the English court, to ask for aid against the French party and against the queen, who was reported to be the mistress of the regent. Meanwhile he was deprived of his bishopric, and forced, for safety, to remain in England, where he effected nothing in the interests of his nephew. The declaration of war by England against Scotland, in answer to the recent Franco-Scottish negotiations, prevented his return. His case was further complicated by the libellous animosity of Beaton, archbishop of St Andrews (whose life he had saved in the "Clear-the-Causeway" incident), who was anxious to thwart his election to the archbishopric of St Andrews, now vacant by the death of Forman. In 1522 Douglas was stricken by the plague which raged in London, and died at the house of his friend Lord Dacre. During the closing years of exile he was on intimate terms with the historian Polydore Vergil, and one of his last acts was to arrange to give Polydore a corrected version of Major's account of Scottish affairs. Douglas was buried in the church of the Savoy, where a monumental brass (removed from its proper site after the fire in 1864) still records his death and interment.

Douglas's literary work, now his chief claim to be remembered, belongs, as has been stated, to the period 1501-13, when he was provost of St Giles. He left four poems.

1. *The Palace of Honour*, his earliest work, is a piece of the later type of dream-allegory, extending to over 2,000 lines in nine-lined stanzas. The poem carries on the literary traditions of the courts of love, as shown especially in the "Romaunt of the Rose" and "The House of Fame." It is dedicated to James IV. No ms. of the poem is extant. The earliest known edition (c. 1553) was printed at London by William Copland, an Edinburgh edition, from the press of Henry Charters, followed in 1579.

2. *King Hart* described King Heart in his castle, surrounded by his five servitors (the senses), Queen Plesance, Foresight and other courtiers. The poem runs to over 600 lines and is written in eight-lined stanzas. The text is preserved in the Maitland folio ms. in the Pepysian library, Cambridge. It is not known to have been printed before 1786, when it appeared in Pinkerton's *Ancient Scottish Poems*.

3. *Conscience* is in four seven-lined stanzas. Its subject is the "conceit" that men first clipped away the "con" from "conscience" and left "science" and "na mair." Then they lost "sci," and had nothing but "ens" ("that schrew, riches and gear").

4. Douglas's longest, last, and in some respects most important work is his translation of the *Aeneid*, the first version of a great classic poet in any English dialect. The work includes the 13th book by Mapheus Vegius, and each of the 13 books is introduced by a prologue. The subjects and styles of these prologues show great variety, some have little or no connection with the books which they introduce, and were perhaps written earlier and for other purposes. In the first, or general, prologue, Douglas attacks Caxton for his inadequate rendering of a French translation of the *Aeneid*. That Douglas undertook this work and that he makes a plea for more accurate scholarship in the translation have been the basis of a prevalent notion that he is a Humanist in spirit and the first exponent of Renaissance doctrine in Scottish literature. Careful study of the text will not support this view. Douglas is in all important respects even more of a medievalist than his contemporaries, and, like Henryson and Dunbar, strictly a member of the allegorical school and a follower, in the most generous way, of Chaucer's art. There are several early mss. of the *Aeneid* extant: (a) in the library of Trinity College, Cambridge, c. 1525, (b) the Elphinstoun ms. in the library of the University of Edinburgh, c. 1525, (c) the Ruthven mss. in the same collection, c. 1535, (d) in the library of Lambeth Palace, 1545-46. The first printed edition appeared in London in 1553. An Edinburgh edition was

issued from the press of Thomas Ruddiman in 1710.

For Douglas's career see, in addition to the public records and general histories, Bishop Sma's *Life* in Ruddiman's edition, and that by John Smill in the first volume, of his edition of the *Works of Gavin Douglas* (4 vols., 1874, the only collected edition of Douglas's works). A new edition of the texts is much to be desired. On Douglas's place in Scottish literature see SCOTTISH LITERATURE, also G. Gregory Smith's *Transition Period* (1900) and chapters in the *Cambridge History of English Literature*, vol. II (1905). P. Linde's dissertation *Chaucer's Einfluss auf die Originaldichtungen des Schotten Gavin Douglas* (Halle, 1885) draws attention to Douglas's indebtedness to Chaucer. Further discussion of the question of Douglas's alleged Humanism will be found in Courthope's *History of English Poetry*, I (1891), T. F. Henderson's *Scottish Vernacular Literature* (1898) and J. H. Millar's *Literary History of Scotland* (1903). For the language of the poem see G. Gregory Smith's *Specimens of Middle Scots* (1902).

DOUGLAS, SIR HOWARD, BART (1776-1861), British general, younger son of Admiral Sir Charles Douglas, was born at Gosport in 1776. He was commissioned second lieutenant in the Royal Artillery in 1794. In 1795 he was shipwrecked while in charge of a draft for Canada and lived with his men for a whole winter on the Labrador coast. In 1804 he was placed in charge of the senior department of the R.M.C. at High Wycombe, the forerunner of the Staff College. Douglas served in 1808-09 and again in 1812 in the Peninsula, but was recalled to the Royal Military College. In 1816 appeared his *Essay on the Principles and Construction of Military Bridges* (subsequent editions 1837, 1853), in 1819, *Observations on the Motives, Errors and Tendency of Mr Carnot's System of Defence* and in 1820 his *Treatise on Naval Gunnery*, which became a standard text book, and indeed first drew attention to the subject of which it treated. From 1823 to 1831 Sir Howard Douglas was governor of New Brunswick, and had to deal with the Maine boundary dispute of 1828. He also founded Fredericton college. On his return to Europe he published *Naval Evolutions*, a controversial work dealing with the question of 'breaking the line' (1822). Douglas was lord high commissioner of the Ionian islands (1835-40), and sat in Parliament from 1842 to 1847. His later works included *Observations on the Modern System of Fortification, etc.* (1859) and *Naval Warfare Under Steam* (1858 and 1860). He died on Nov. 9, 1861, at Tunbridge Wells. Douglas was a F.R.S., one of the founders of the R.G.S., and held many honours. He was created full general in 1851.

See S. W. Fullam, *Life of Sir Howard Douglas* (1862), and *Gentleman's Magazine*, 3rd series, xii, 90-92.

DOUGLAS, SIR JAMES (1803-1877), Canadian administrator, was born on June 5, 1803, in Lanarkshire, Scotland where he was educated. In 1820 he went to Canada, and four years later became the organizer of the property of the Hudson's Bay company west of the Rockies. In 1830 he was transferred to Ft. Vancouver in the Oregon Territory, where he extended the company's forts. In 1843 he became Camosun, the place where Victoria now stands, the chief northern centre of the fur trade. After the north-west Boundary Treaty of 1846, which moved the British frontier back to the 49th parallel, Douglas was appointed senior officer of the western department, and in 1851 became governor of Vancouver. In 1859 his statesmanship made possible the joint occupation of the island of San Juan by an equal number of British and American troops. When British Columbia was made a Crown colony in 1858, Sir James Douglas held its governorship with that of Vancouver until 1863. He died at Victoria on Aug. 1, 1877.

See Coats and Gossnell, *Sir James Douglas* (Makers of Canada Series, vol. II, 1908).

DOUGLAS, SIR ROBERT KENNAWAY (1838-1913) English orientalist, was born in Devon. In 1858 he became attached to the Chinese Consular Service. Seven years later he returned to England and was made assistant in charge of the Chinese library in the British Museum and, in 1893, keeper of the Oriental books and manuscripts. He was also professor of Chinese in London. He died at Chippenham on May 20, 1913. His chief publications are *Life of Yen-chu K'han* (trans. from Chinese, 1877), *Confucianism and Taoism* (1879), *China* (1882), *Society in China* (1894), *Li Hung Chang* (1895), and *Europe and the*

Far East (1904).

DOUGLAS, STEPHEN ARNOLD (1813-1861), American political leader, was born in Brandon, Vt., on April 23, 1813. Left in infancy to the care of a widowed mother and a bachelor uncle, he became a cabinet maker's apprentice in Middlebury and Brandon. He attended schools at Brandon and Canandaigua, N.Y., and began the study of law. In 1833 he went west and finally settled in Jacksonville, Ill., where he was admitted to the bar in March 1834. From that time he took an active interest in politics and his rise was remarkably rapid. In Feb. 1835 he was elected public prosecutor of the first judicial circuit, in Dec. 1836 he became a member of the State legislature. In 1837 he was appointed by President Van Buren registrar of the land office at Springfield, which had just become the State capital. In 1840 he did much to carry the State for Van Buren, and for a few months he was secretary of State of Illinois. He was a judge of the supreme court of Illinois from 1841 to 1843. In 1843 he was elected to the national House of Representatives.

In Congress, though one of the youngest members, he at once sprang into prominence by his clever defence of Jackson for alleged contempt of court in New Orleans. He was soon recognized as one of the ablest and most energetic of the Democratic leaders. An enthusiastic believer in the destiny of his country and more especially of the West, and a thorough going expansionist, he heartily favoured the measures which resulted in the annexation of Texas and in the Mexican War—in the discussion of the former foreshadowing his doctrine of "popular sovereignty." Taking an active share in the Oregon controversy, he opposed yielding "one inch" of the territory to Great Britain and advocated extending United States settlements under military protection. He was an advocate of the construction, by the aid of Government land grants, of a trans-continental railway, and the chief promoter (1850) of the Illinois Central. As chairman of the committee on territories, at first in the House, and then in the Senate, of which he became a member in Dec. 1847, he introduced the bills for admitting Texas, Florida, Iowa, Wisconsin, Minnesota, California and Oregon into the Union, and for organizing the Territories of Minnesota, Oregon, New Mexico, Utah, Washington, Kansas and Nebraska.

In the bitter debates concerning the keenly disputed question of slavery in the Territories, Douglas was particularly prominent. Against slavery itself he seems never to have had any moral antipathy, and his first wife and children were by inheritance the owners of slaves, though he himself never was. He did more, probably, than any other one man, except Henry Clay, to secure the adoption of the Compromise Measures of 1850. Nevertheless the bill for organizing the Territories of Kansas and Nebraska, which Douglas reported in Jan., 1854, and which in amended form was signed by the president on May 30, reopened the whole slavery dispute—wintonly, his enemies charged, for the purpose of securing Southern support—and caused great popular excitement. It repealed the Missouri Compromise, and declared the people of "any State or Territory" "free to form and regulate their domestic institutions in their own way, subject only to the Constitution of the United States", that is, "popular sovereignty" or "squatter sovereignty" would determine the admission of slavery. The passage of this Kansas Nebraska bill, one of the most momentous in its consequences ever passed by the Federal Congress, was in largely a personal triumph for Douglas, who showed marvelous energy, adroitness and resourcefulness, and a genius for leadership but was universally condemned in the free States. His hostility to "know-nothingism" and his plea for religious toleration also caused him trouble, but in 1852 and again in 1856 he was a strong candidate for the presidential nomination in the National Democratic Convention.

In 1857 he broke with President Buchanan and the "administration" Democrats and lost much of his prestige in the South, but partially restored himself to favour in the North, and especially in Illinois, by his vigorous opposition to the method of voting on the Lecompton constitution, which he maintained to be fraudulent and (in 1858) to the admission of Kansas into the Union under this constitution. In 1858, when the Supreme Court, after

the vote of Kansas against the Lecompton constitution, had decided that Kansas was a "slave" territory, thus quashing Douglas's theory of "popular sovereignty," he engaged in Illinois in a close contest for the senatorship with Abraham Lincoln, the Republican candidate, whom he met in a series of debates. Although in Illinois his followers did not poll so large a vote as Lincoln's, Douglas won the senatorship by a vote in the legislature of 54 to 46. In the senate he was not reappointed chairman of the committee on territories.

In 1860, in the Democratic national convention in Charleston, the adoption of Douglas's platform brought about the withdrawal from the convention of Alabama, Mississippi, Louisiana, South Carolina, Florida, Texas and Arkansas. The convention adjourned to Baltimore, where the Virginia, North Carolina, Tennessee, Kentucky and Maryland delegations left it, and where Douglas was nominated for the presidency by the northern Democrats. He campaigned vigorously but hopelessly, boldly attacking disunion, and in the election, though his popular vote was 1,376,957, he received an electoral vote of only 12, against Lincoln's 180. Douglas urged the south to acquiesce in Lincoln's election, and he and his second wife, Adele Cutts, were among the foremost to welcome the Lincolns to Washington. On the outbreak of the Civil War he denounced secession as criminal, and was one of the strongest advocates of maintaining the integrity of the union at all hazards. At Lincoln's request he undertook a mission to the border states and the northwest to rouse the spirit of unionism; he spoke in West Virginia, Ohio and Illinois. He died on June 3, 1861, at Chicago, where he was buried on the shore of Lake Michigan.

In person Douglas was conspicuously small, being hardly five feet in height, but his large head and massive chest and shoulders gave him the popular sobriquet "The Little Giant." As a resourceful political leader, and an adroit, ready, skilful tactician in debate, he has had few equals in American history. His generosity in defeat, his courage and his capacity for inspiring warm personal friendships are among his most attractive qualities. It was regretted that his death came just when a new and great era of usefulness seemed opening before him.

One of the most sympathetic biographies is that by Allen Johnson (1908). Other biographies are by H. M. Flint (1866), J. W. Sheahan (1866), W. G. Brown (1902), Wm. Gardner (1902), C. E. Carr (1909), H. P. Willis (1910), and Louis Howland (1910). See also P. O. Ray, *Repeal of the Missouri Compromise* (1900), and an autobiographical sketch in the Ill. State Hist. Soc. Journal (vol. v, Oct., 1912).

DOUGLAS, capital of the Isle of Man, municipal borough and favourite watering place. Pop. (1930) 20,214. Area, 1.9 sq mi. It stands on a fine semicircular bay on the east coast of the island,

immediately north of this, vessels drawing 9 ft may enter it during neap tides, and those drawing 13 ft during spring tides. A castellated building (Tower of Refuge, 1832), marks the dangerous Conister rocks, north of the harbour entrance. The harbour is protected by three piers, the Battery pier, the Red pier and the Victoria pier (at which passengers can load and embark at all tides). There is regular daily communication with Liverpool, and during the season there are connections with Fleetwood, Heysham, Barrow, Dublin, Belfast and Glasgow. Douglas is connected by electric tramway northward with Laxey, the summit of the mountain of Snaefell and Ramsey, and southward with Port Soderick; while the Isle of Man railway runs to Peel in the west, and Castletown and Port Erin in the southwest. The various popular attractions include theatres, dancing halls, a racecourse and two golf links. The shore of the bay is of firm sand, and the sea bathing is good. Among buildings and institutions are the legislative buildings (1893), the town hall (1899), the free library,

the courthouse and the Isle of Man hospital. St. George's church, oldest in Douglas, dates from 1780. Douglas was incorporated in 1895.

DOUGLAS, a civil parish, Lanarkshire, Scotland. Pop. (1931) 2,948. It is on Douglas water, 4 mi. from Douglas station and 1½ mi. from Douglas West station, on the branch line of the LMSR from Cirstairs to Av. SSW of Lanark. It is the original home of the Douglas family. Of the old castle, Scott's *Castle Dangerous*, only a tower exists, it repeatedly changed hands during the wars of Edward I. The modern castle is the seat of the Earl of Home. Only choir and spire remain of the 12th century church of St. Bride, patron saint of the Douglases. The vault beneath the choir was, until 1761, the burial place of the family, and it contains a silver case said to hold the ashes of the heart of the "good Sir James" (1286-1330). In 1879 the choir was restored and the tombs (including that of Sir James Douglas) repaired. On the hill of Auchenshugh, 2½ mi. S.E., the Cameronians assembled in 1712 to renew the Solemn League and Covenant.

DOUGLAS, a city of Cochise county, Arizona, U.S.A., 25 mi. S.E. of Bisbee, on the Mexican border line. It is on federal highway 80 and the Southern Pacific railway and is served by air and bus lines. The population was 9,393 in 1950 and 8,623 in 1940 by the federal census. Cattle raising and copper smelting are the main occupations of this part of Arizona, and the Sonora mining region of Mexico lies directly south. The city has immense copper smelters, to which carloads of ore are brought daily from the mines at Bisbee and other points in Arizona and in Mexico. There was formerly a U.S. army post (Camp Harry J. Jones) at Douglas. The Coronado National forest, within which is the Chiricahua National monument, is 55 mi. north. Douglas was settled about 1904 and incorporated as a city in 1905.

DOUGLAS-FIR (*Pseudotsuga taxifolia*), an important North American timber tree of the pine family (Pinaceae), called also red fir, yellow-fir and Douglas spruce. Botanically it exhibits some of the characteristics of the firs and the hemlock, although it most closely resembles the spruces. It is found from South Dakota to British Columbia and southward to Texas and Mexico, but attains its maximum development in Washington and Oregon, where it forms immense forests, furnishing the valuable structural timber known also in the lumber trade as yellow fir, Oregon-fir or Oregon-pine. In the forests of Washington it commonly reaches a height of 180 ft or 190 ft with a trunk diameter of 3½ ft to 6 ft and sometimes attains a height of 250 ft and a trunk diameter of 10 ft or 12 ft. Among North American trees it is exceeded in height and massiveness only by the giant sequoias of California. According to the U.S. department of agriculture, the lumber cut of Douglas-fir in 1940 amounted to 7,121,000,000 bd ft, with a value at the mill exceeding \$140,000,000, in footage more than one-fourth of the total lumber cut of the United States during that year. Of this production of Douglas fir lumber the states of Washington and Oregon contributed more than 90%. The closely related bigcone-spruce (*P. macrocarpa*) a much smaller tree, native to southern California, with large cones sometimes 3 in thick and 7 in long, hanging from the widely spreading branches, is of value chiefly as cover on arid mountain slopes. (E. S. Hx.)

DOUGLASS, FREDERICK (1817-1895), American orator and journalist, was born in Tuckahoe, Md., probably in Feb. 1817. His mother was a Negro slave of exceptional intelligence, and his father was a white man. Until nearly eight years of age, he was under the care of his grandmother, then he lived for a year on the plantation of Col. Edward Lloyd, of whose vast estate his master, Capt. Aaron Anthony, was manager. After a year he was sent to Baltimore where he lived in the family of Hugh Auld, whose brother, Thomas, had married the daughter of Capt. Anthony. Mrs. Auld treated him with marked kindness and without her husband's knowledge began teaching him to read. With money secretly earned by blacking boots he purchased his first book, *The Columbian Orator*, he soon learned to write "free passes" for runaway slaves. Upon the death of Capt. Anthony in 1833, he was sent back to the plantation to serve Thomas Auld, who hired him out for a year to one Edward Covey, who had a

wide reputation for disciplining slaves, but who did not break Frederick's spirit. Although a new master, William Ireland, who owned a large plantation near St. Michael's, Md., treated him with much kindness, he attempted to escape in 1836, but his plans were suspected, and he was put in gaol. For lack of evidence he was soon released, and was then sent to Hugh Auld in Baltimore, where he was apprenticed as a ship caulker. He learned his trade in one year, and in Sept. 1838, masquerading as a sailor, he escaped by railway train from Baltimore to New York city. For the sake of greater safety he soon removed to New Bedford, Mass., where he changed his name from Frederick Augustus Washington Bailey to Frederick Douglass, "Douglass" being adopted at the suggestion of a friend who greatly admired Scott's *Lady of the Lake*. For three years he worked as a day labourer in New Bedford. An extempore speech made by him before an anti-slavery meeting at Nantucket, Mass., in Aug. 1841 led to his being appointed one of the agents of the Massachusetts Anti-Slavery Society, and in this capacity he delivered during the next four years numerous addresses against slavery, chiefly in the New England and middle states. To quiet the suspicion that he was an impostor, in 1845 he published the *Narrative of the Life of Frederick Douglass, an American Slave*. Learning his capture, his friends persuaded him to go to England, and in 1845-47 he lectured in Ireland, Scotland and England, and did much to enlist the sympathy of the British public with the Abolitionists in America. Before his return a sum of £150 was raised by subscription to secure his legal manumission, thus relieving him from the fear of being returned to slavery in pursuance of the Fugitive Slave law. From 1847 to 1866 he conducted an anti-slavery weekly journal known as *The North Star*, and later as *Frederick Douglass's Paper*, at Rochester, N.Y., and, during this time, also was a frequent speaker at anti-slavery meetings. At first a follower of Garrison and a disunionist, he allied himself after 1851 with the more conservative political abolitionists, who, under the leadership of James C. Birney, adhered to the national Constitution and endeavoured to make slavery a dominant political issue. He disapproved of John Brown's attack upon Harper's Ferry in 1859, and declined to take any part in it. During the Civil War he was among the first to suggest the employment of negro troops by the United States Government, and two of his sons served in the Union army. After the war he was for several years a popular public lecturer. In 1871 he was assistant secretary of the Santo Domingo commission, appointed by President Grant. He was marshal of the District of Columbia in 1877-81, was recorder of deeds for the district in 1881-86, and from 1889 to 1891 was the American minister resident and consul general in the Republic of Haiti. Douglass was widely known for his eloquence, and was one of the most effective orators whom the negro race has produced in America. He died in Anacostia Heights, D.C., on Feb. 20, 1895.

His autobiography appeared, after two revisions, as *The Life and Times of Frederick Douglass* (1882). See F. M. Holland, *Frederick Douglass, the Colored Orator* (1891), C. W. Chesnut, *Frederick Douglass* (Boston, 1899), and Booker T. Washington, *Frederick Douglass* (Philadelphia, 1907), in the series of American Crisis Biographies.

DOUKHOBORS, a name given by the Russian Orthodox clergy to a community of nonconformist peasants. The word signifies "spirit-fighters," and was intended by the priesthood to convey that they fight against the Spirit of God, but the Doukhobors themselves accepted it as signifying that they fight, not against, but for and with the Spirit, though later they decided to give up this name and call themselves "Christians of the Universal Brotherhood." The community was first heard of in the middle of the 18th century, by the beginning of the 19th their doctrine had become so clearly defined, and the number of their members had so greatly increased, that the Russian government and Church, considering the sect to be peculiarly obnoxious, started an energetic campaign against it. The foundation of the Doukhobors' teaching consists in the belief that the Spirit of God is present in the soul of man, and directs him by its word within him. They understand the coming of Christ in the flesh, His works, teaching and sufferings, in a spiritual sense. The object of the sufferings of Christ, in their view, was to give an example of suffering for truth.

Christ continues to suffer in us even now when we do not live in accordance with the behests and spirit of His teaching. The whole teaching of the Doukhobors is penetrated with the Gospel spirit of love, worshipping God in the spirit, they affirm that the outward Church and all that is performed in it and concerns it has no importance for them, the Church is where two or three are gathered together, *i.e.*, united in the name of Christ. They pray inwardly at all times, on fixed days they assemble for prayer-meetings, at which they greet each other fraternally with low bows, thereby acknowledging every man as a bearer of the Divine Spirit. Their teaching is founded on tradition, which is called among them the "Book of Life," because it lives in their memory and hearts. It consists of sacred songs or chants, partly composed independently, partly formed out of the contents of the Bible, which, however, has evidently been gathered by them orally, as until lately they were almost entirely illiterate and did not possess any written book. They found alike their mutual relations and their relations to other people and to all living creatures exclusively on love, and therefore they hold all people equal and brethren. They extend this idea of equality also to the government authorities, obedience to whom they do not consider binding upon them in those cases when the demands of these authorities are in conflict with their conscience, while in all that does not infringe what they regard as the will of God they willingly fulfil the desire of the authorities. They consider killing, violence, and in general all relations to living beings not based on love as opposed to their conscience and to the will of God. They are industrious and abstemious in their lives, and when living up to the standard of their faith present one of the nearest approaches to the realization of the Christian ideal which has ever been attained. In many ways they have a close resemblance to the Quakers.

For these beliefs and practices the Doukhobors long endured cruel persecution. Under Nicholas I, in 1840 and 1850, when, on religious grounds, they refused to participate in military service, they were banished from the government of Tauris—whither they had been previously deported from various parts of Russia by Alexander I—to Transcaucasia, near the Turkish frontier. But neither the severe climate nor the neighbourhood of wild and warlike hillmen shook their faith, and in the course of half a century, in one of the most unhealthy and unfertile localities in the Caucasus, they transformed a wilderness into flourishing colonies, and continued to live a Christian and laborious life, making friends with, instead of fighting, the hillmen. But the wealth to which they attained in the Caucasus weakened for a time their moral fervour, and little by little they began to depart somewhat from the requirements of their belief. As soon, however, as events happened among them which disturbed their outward tranquility, the religious spirit which had guided their fathers immediately revived within them. In 1887, in the reign of Alexander III, universal military service was introduced in the Caucasus, and even those for whom, as in the case of the Doukhobors, it had formerly been replaced with banishment, were called upon to serve. This measure took the Doukhobors unawares, and at first they outwardly submitted to it. About the same time, by the decision of certain government officials, the right to the possession of the public property of the Doukhobors (valued at about £50,000) passed from the community to one of their members, who had formed out of the more demoralized Doukhobors a group of his own personal adherents, which was henceforth called the "Small Party." Soon afterwards several of the most respected representatives of the community were banished to the government of Archangel. This series of calamities was accepted by the Doukhobors as a punishment from God, and a spiritual awakening of a most energetic character ensued. The majority (about 12,000) resolved to revive in practice the traditions left them by their fathers, which they had departed from during the period of opulence. They again renounced tobacco, wine, meat and every kind of excess, many of them dividing up all their property in order to supply the needs of those who were in want, and they collected a new public fund. They also renounced all participation in acts of violence, and therefore refused military service. In confirmation of their sincerity, in the summer of 1895 the Doukhobors of the

"Great Party," as they were called in distinction from the "Small Party," burnt all the arms which they, like other inhabitants of the Caucasus, had taken up for their protection from wild animals, and those who were in the army refused to continue service. At the commencement of the reign of Nicholas II, in 1895, the Doukhobors became the victims of a series of persecutions, Cossack soldiers plundering, insulting, beating and maltreating both men and women in every way. More than 400 families living in the province of Tiflis were ruined and banished to Georgian villages, of 4,000 thus exiled, over 1,000 died in the course of the first two years from exhaustion and disease, and more would have perished had not information reached Tolstoy, and through him the Society of Friends in England, and funds were immediately raised for alleviating their sufferings. At the same time an appeal, written by Tolstoy and some of his friends, requesting the help of public opinion in favour of the oppressed Doukhobors, was circulated in St Petersburg and sent to the emperor and higher government officials. The Doukhobors themselves asked for permission to emigrate, and the Society of Friends petitioned the emperor to the same effect. In March 1898 the desired permission was granted, and the first party (1,126) in the summer were able to sail for Cyprus, which was originally chosen for their settlement because at that time funds were not sufficient for transferring them to any other British territory. Later it was found possible to send two parties of over 4,000 to Canada, whether they arrived in Jan. 1899. They were joined in the spring of the same year by the Cyprus party, and some 2,000 from the Caucasus, and in all about 7,500 Doukhobor immigrants arrived in Canada, the government allotting them land in the provinces of Assiniboia near Yorktown and of Saskatchewan near Thunder Hill and Prince Albert. They were very cordially received by the population of the Canadian port towns. In April 1901, in the Canadian House of Commons, the minister of justice made a statement about them in which he said that "not a single offence had been committed by the Doukhobors, they were law abiding, and if good conduct was a recommendation, they were good immigrants. The large tracts of land demanded population, and if they were not given to crime, the conclusion was that they would make good citizens." Nevertheless the Canadian government has had difficulties with the sect owing to their objection to acknowledge any allegiance except to their leader Verigin, who, however, proved himself an eminently practical man.

See V. Tcherikoff, *Christian Martyrdom in Russia* (1897), Aylmer Maude, *A Peculiar People* (N.Y., 1904), and ref. in article "Doukhobors," by A. A. Stambouli, in Hastings, *Encyclopaedia of Religion and Ethics*.

DOULLENS, a town of northern France, capital of an *arrondissement* in the department of Somme on the Authie, 27 mi N. of Amiens by rail. Pop. (1936) 4,429. Doullens, the ancient *Dulincum*, was an important stronghold in the middle ages. In 1475 it was burnt by Louis XI for openly siding with the Spaniards, but was restored to France by the treaty of Vervins (1598). It was an important British centre in the war of 1914-18. It has a citadel of the 15th and 16th centuries, now a girls' school. The old hotel de ville has a fine belfry and dates from the 15th to the 17th century. The town is the seat of a subprefect and has a tribunal of first instance, it has trade in phosphates, of which there are workings in the vicinity, and carries on cotton-spinning and the manufacture of leather and paper.

DOULTON, SIR HENRY (1820-1897), English inventor and manufacturer of pottery, was born in Vauxhall on July 25, 1820, and died in London on Nov. 18, 1897. From the age of 15 he was employed in the pottery works of his father, John Doulton, at Lambeth. One of the first results of his experiments was the production of good enamel glazes. In 1846 he imitated in Lambeth the pipe works for the manufacture of the drainage and sanitary appliances which have helped to make the firm of Doulton famous. In 1870 the manufacture of "Art pottery" was begun at Lambeth, and in 1877 works were opened at Burslem, and later at Rowley Regis, Smethwick, St. Helens, Paisley and Paris. After the Paris exhibition of 1878 Henry Doulton was

made a chevalier of the Legion of Honour. In 1872 the "Art department" was instituted in the Doulton works, giving employment to both male and female artists, amongst whom George Tinworth and the Misses Barlow obtained a reputation outside their immediate sphere. In 1885 Doulton was awarded the Albert medal by the Society of Arts, and was knighted in 1887.

DOUMER, PAUL (1857-1933), French statesman, was born at Aurillac on March 22, 1857, and entered the Chamber of Deputies in 1888. As minister of finance in the Bourgeois cabinet (Nov. 3, 1895, to April 21, 1896), he tried without success to introduce an income tax. In Jan. 1897 he became governor of Indo-China, where he carried out important public works. In 1902 he returned to France and to the Chamber of Deputies. He refused to support the Combes ministry, and formed a Radical dissident group, which eventually caused the fall of the ministry. Doumer was elected president of the chamber in Jan. 1905, being re-elected in Jan. 1906. Senator in 1921, he was minister without portfolio in the Poincaré Government, and in 1921-22 and 1925-26 was minister of finance. In 1932, shortly after his election as president of the Republic, he was assassinated by a Russian. Doumer wrote *L'Indo-Chine française* (1903).

DOUMERGUE, GASTON (1863-1937), 12th president of the Third French Republic, was born at Agues-Vives on Aug. 1, 1863, and was educated at the Lycée at Nîmes. He studied law, became a barrister, and, after holding magisterial appointments in Cochinchina and Algiers, was elected deputy for Nîmes in 1893. In the Chamber he spoke with authority on colonial questions and was minister for the colonies in the Combes Government, 1902-05, being elected vice-president of the Chamber when this administration fell. In 1906 he was minister of commerce in the Sarrien cabinet, retaining his portfolio in the succeeding Clemenceau Government. When M. Clemenceau reconstituted his cabinet, M. Doumergue became minister of education and held the same post in the Brand ministry (July 1909 to Nov. 1910). In the latter year he became senator for the Gard Department and strongly advocated the Three Years' Military Service Bill.

On the fall of M. Barthou's administration in Dec. 1913, M. Doumergue formed a cabinet in which he himself took charge of foreign affairs. He was forced to resign, however, after the general elections of May 1914, which resulted in a majority in the Chamber opposed to the Three Years' Military Service law. On the outbreak of the World War he again became minister for the colonies in the Viviani Government of national defence. In 1917 he left the Government, and was sent on a mission of inquiry into conditions in Russia. On his return he re-entered the senate. After the resignation of M. Léon Bourgeois on Feb. 22, 1923, M. Doumergue was elected to succeed him as president of the senate. He supported the policy of M. Poincaré with regard to Germany and the Ruhr. On June 13, 1924, he was elected president, and remained in office until 1931. He was prime minister of a National Government from February to November, 1934.

DOUMIC, RENÉ (1860-1937), French critic and Academician, was born in Paris, and after a distinguished career at the École Normale began to teach rhetoric at the Collège Stanislas. He was a contributor to the *Moniteur*, the *Journal des Débats* and the *Revue bleue*, but was best known as the independent and uncompromising literary critic of the *Revue des Deux Mondes*. Many of his critical essays are reprinted in *Études sur la littérature française* (5 vols., 1896-1905), *Les Hommes et les siècles du XIX^e siècle* (1903), etc. He died in Paris, Dec. 2, 1937.

DOUNE, a small burgh, Perthshire, Scotland, 8½ mi N.W. of Stirling by the L.M.S.R. Pop. (1938) 841. It is on the left bank of the Teith, here crossed by the bridge built in 1535 by Robert Spittal, tailor to James IV. The town was once famous for pistols and sporrans. Doune castle, in a commanding position on the Teith, is believed to have been built by Murdoch, 2d duke of Albany (d. 1425). A nephew of Rob Roy held it for Prince Charlie, and it figures in Scott's *Waverley*. It belongs to the earl of Moray (Murray). The braes of Doune lie to the north-west of the town and extend towards Uam Var Deansfont, 1 mi S.W. of Doune, on the right bank of the Teith, has cotton mills, and was the scene of James Smith's (1789-1850) agricultural experi-

ments in deep ploughing and machine design

DOURO (Span *Dnro*, Port. *Douro*, anc. *Durius*) a river of the Iberian peninsula. The Douro rises south of the Sierra de la Demanda in the Pico de Urbiön, an isolated mass 7389 ft high. It curves past Soria and then flows westward across Old Castile. It passes south of Valladolid and proceeds westward to the Portuguese frontier. The numerous tributaries have been most important influences in the growth of Castile's power in the middle ages. The northern tributaries, especially the Pisuerga, Valdeira duey and Esla, come from the region of heavy rainfall. The tributaries from the south, of which the Adaja, Tormes and Veltes are the most important, come from the drier Meseta.

From the great highland basin the Douro turns south west, forming from a point east of Paradelia to Barca d'Alva a section of the boundary between Spain and Portugal. This marked north east to south-west line of the middle Douro has some relation to the general direction of the old mountain ribs of the Meseta. The river leaves the ancient plateau in a series of deep gorges in the difficult country of northern Portugal. In this country it receives the Ageda, Cõa and Pava from the left, and the Sabor, Tua and Tamega from the right. The river enters the Atlantic 3 m below Oporto at São João da Foz. The probable length of the river is about 485 m, and the area of its basin upwards of 37,500 sq miles. The rapids (*portos*) and gorges of the Portuguese section of the river seriously impede navigation. The lower reaches of the river are also liable to heavy floods. The difficulty of navigation is compensated for by the railway that follows the valley through most of the Portuguese section. The mouth of the river is partly blocked by a sand bar, which only allows small ships to enter. The large vessels have to be accommodated at Lervos, an artificial harbour to the north of the estuary. The Douro is the outlet for the important wine-producing region of the Paiz do Vinho. The Douro yields an abundance of fish.

DOUROUCOULI, the native name of a small group of American monkeys ranging from Nicaragua to Amazonia and eastern Peru, and forming the genus *Aotus*. In addition to the absence of prehensile power in their tails, *douroucouli*s are distinguished by their large eyes. The ears are short, and the hair round the eyes forms a disc. *Douroucouli*s live in parties and are nocturnal. They feed on insects and fruit and, when excited, utter piercing screams.

DOUSA, JANUS (JAN VAN DER DOES), lord of Noordwyck (1545-1604), Dutch statesman and scholar, was born at Noordwyck on Dec. 6, 1545, and studied at Delft, Louvain, Douai and Paris. His name stood first on the list of nobles who in 1565 formed a league against Philip II of Spain. He was living at Leyden at the time of the famous siege, and took a gallant and leading part in the defence against the Spaniards. William the Silent made him first curator of the new university in Leyden, a post which he held for nearly 30 years. After the assassination of William, Douse went to England to persuade Queen Elizabeth to support the cause of the States. The rest of his life was devoted to literary work. His position of keeper of the State archives put within his reach the materials for his valuable *Annals of Holland*. He also wrote commentaries on Horace, Plautus and Catullus. He died at Noordwyck on Oct. 8, 1604.

DOUVILLE, JEAN BAPTISTE (1794?-1837), French traveller, was born at Mamby (Maiche), and is said to have been murdered in 1837 on the banks of the Sao Francisco in Brazil. He received the gold medal of the Paris Société de Géographie for his *Voyage au Congo* (1832), but his account of his travels was proved to be fictitious and there is no evidence that he went beyond the coast. His narrative was based on unpublished Portuguese sources.

DOUW (or Dow), **GERRIT** (GERARD) (1613-1675), Dutch painter, was born at Leyden on April 7, 1613. His first instructor was Bartholomew Dolendo, an engraver, and he afterwards learned the art of glass painting under Peter Couwenhove. In 1628 he became a pupil of Rembrandt, from whom he acquired his skill in colouring, and in the more subtle effects of lighting, and the style of Rembrandt is reflected in several of his earlier pictures, notably in a portrait of himself at the age of 22, in the Bridge-

water House gallery, London, and in the "Blind Tobit going to meet his Son," at Wardour castle, Wiltshire. England. His more mature manner was in some respects antagonistic to that of his master. He cultivated a minute treatment of his subjects, but notwithstanding his meticulous style, the general effect was but monotonous and free from stiffness, and his colour was always admirably fresh and transparent. He was fond of representing subjects in lantern or candle light, the effects of which he reproduced with a fidelity and skill which no other master has equalled. He frequently painted by the aid of a concave mirror, and to obtain exactness looked at his subject through a frame crossed with squares of silk thread. His practice as a portrait painter, which was at first considerable, gradually declined, sitters being unwilling to give him the time that he thought necessary. His pictures were always small in size, and represented chiefly subjects in still life. Upwards of 200 are attributed to him, and specimens are to be found in most of the great public collections of Europe. Among his more famous works are the "Woman sick of the Dropsy," in the Louvre, the "Evening School," in the Amsterdam gallery, the "Poulterer's Shop," and a portrait of himself in the National Gallery, London. Douw's pictures brought high prices, and it is said that President Van Spring of The Hague paid him 1,000 florins a year simply for the right of pre-emption. Douw died in Leyden in Feb. 1675. His most celebrated pupil was Francis Mieris.

See W. Martin, *Het leven en de werken van Gerrit Douw* (1901).

DOVE, ALFRED (1844-1916), German historian, was born on April 4, 1844, in Berlin, and studied medicine and science at Heidelberg and Berlin. From 1870 he edited *Grenzboten* and then *Im Neuen Reich*. In 1874 he became professor of history at Breslau and in 1884 at Bonn. In 1890 he edited the *Samtliche Werke* of von Ranke, whose posthumous manuscript, completing the *Weltgeschichte* he had already published and in 1891 the final volumes of Bismarck's speeches. Dove also wrote *Deutsche Gesch. im Zeitalter Friedrichs des Grossen u. Joseph II.* (1883), *Kaiser Wilhelms geschichtl. Gestalt* (1888), *Grossherzog Friedrich von Baden als Landesherz und deutscher Fürst* (1902). He died at Freiburg on Jan. 19, 1916.

DOVE, HEINRICH WILHELM (1803-1879), German meteorologist, was born at Liegnitz, Silesia, on Oct. 6, 1803. He studied mathematics and physics at Berlin and Breslau. He was professor of physics at Königsberg (1826-29), supplementary professor (1829-45), and finally, professor of physics at Berlin. He made an exhaustive and exact study of the distribution of temperature over the surface of the earth, giving many of his results in carefully drawn maps. This work has been of great importance to geographers and geologists. He also carried out a series of investigations on winds and phenomena allied with winds, he was considerably hampered in this work by the fact that the barometers in use at the time did not give reliable readings. Dove was a foreign member of the Royal Society. He died at Berlin on April 6, 1879. Among his publications were *Über Mass und Messen* (1835), *Meteorologische Untersuchungen* (1837), and *Klimatologische Beiträge* (1857-69).

See H. Neumann, *H. W. Dove* (1925).

DOVE, a river of England, tributary to the Trent, rising in the Edg., Derbyshire, and through almost its entire course forming the boundary of that county with Staffordshire. In its upper course it traverses a fine narrow valley, where the limestone hills exhibit many picturesque cliffs, gullies and caves. Doveclade, that part between Dove Holes and Thorne Cloud, is especially famous. Below Thorne Cloud the Dove receives on the west the Manifold, which, like it, tributary, the Hamps, and other streams in the limestone district, has part of its course below ground. Near the village of Rocester the Churnet joins the Dove on the west, and then its course, hitherto southerly, bends nearly easterly on passing Uttoxeter, and, winding through a widening valley, joins the Trent below Burton-on-Trent at Newton Solney. The length of the valley is about 40 m and the total fall of the river about 1,450 feet. The Dove is well known for trout-fishing, and Beresford Dale, below Hartington, has a special interest for fishermen through its associations with Isaac Walton and Charles Cotton, whose fishing house stands near the Pike Pool.

DOVE, a name applied to the smaller members of the order Columbidae, but no sharp distinction can be drawn between pigeons (*q v*) and doves

The English ring dove or wood pigeon (*Columba palumbus*) is a common bird in most parts of Europe, where it is the largest species. It may be recognized by the large white patches on the wings and the white spot (sometimes absent, however) on either side of the neck, whence it gets its name. Its familiar cooing song is remarkable for its abrupt close. It makes a slight platform of stick on the horizontal bough of a tree and thereon lays two white eggs. In the wild state, it is very wary and the flight is strong and rapid.

The stock dove (*C. oenas*) is smaller and breeds in hollow trees or rabbit holes. It is darker than the ring-dove, lacking the white on the wings and neck, and is locally distributed.

The rock-dove (*C. livia*) is the parent stock of our domestic pigeons. In the wild state it haunts the rocky coasts of Europe. Domestic pigeons have been classified by Darwin (*Variation of Animals and Plants under Domestication*) in four groups.

I The "Pouters," having the gullet of great size, barely separated from the crop and capable of inflation.

II Three races: (1) "Carriers," with a long bill and eyes surrounded by bare skin; (2) "Runts," with a long massive bill and large body; (3) "Barbs," with a short bill and bare skin round the eyes. There are numerous sub races.

III An artificial group, comprising five races: (1) "Fan-tails," whose tail may consist of 42 rectrices, instead of the normal 12; (2) "Turbits" and "Owls," with the feathers of the throat diverging and a short thick bill; (3) "Tumblers," which tumble backwards during flight; (4) "Frill backs," in which the feathers are reversed; (5) "Jacobsins," with the neck feathers forming a hood.

IV Resembling the normal form and including two races: (1) "Trumpeters," with a tuft of feathers at the base of the neck, curling forward, and a peculiar voice; (2) Pigeons scarcely differing from the wild stock.

The differences extend to every part of the body. Doves have from time immemorial been employed as messengers (*e.g.*, Gen. viii. 8-12).

The headquarters of the Columbidae are the Papuan sub region (see PIGEON).

The turtle dove of Europe (*Streptopelia turtur*) is a summer visitor to the northern parts of the Continent. The collared or Barbary dove (*S. decacotis*) is distinguished by its cream coloured plumage and black necklace.

In North America the name is given to the very widely distributed mourning dove (*Zenaidura macroura*), the white-fronted dove (*Leptotila verreauxi angelica*), from southern Texas to Guatemala, the ground dove (*Columbigallina passerina*), and the Inca dove (*Scardafella inca*) of Texas and Mexico.

DOVEKIE, the common name in North America for the little auk (*Plautus alle*). It is long breeding on rocky coasts and islands of the North Atlantic (See AUKS). The name is applied by sailors to the black gull-mot (*See GULLMOT*).

DOVER, GEORGE JAMES WELBORE AGAR-ELLIS, BARON (1797-1833), English man of letters, was the only son of the 2nd Viscount Clifden. He secured the grant of £57,000 to purchase John Julius Angerstein's collection of pictures, which formed the foundation of the National Gallery. He was president (1832) of the Royal Society of Literature, a trustee of the British Museum and of the National Gallery, and a commissioner of public records.

Lord Dover edited the *Ellis Correspondence* (1829) and *Walpole's Letters to Sir Horace Mann* (1833), and he was the author of some historical works.

DOVER, ROBERT (1575-1641), English captain and attorney, is known as the founder and director for many years of the "Cotswold Games," which he originated as a protest against the growing Puritanism of the day. These sports, which were referred to by contemporary writers as "Mr Robert Dover's Olympic Games upon the Cotswold Hills," consisted of cudgeling, wrestling, running at the quintain, jumping, casting the

bar and hammer, hand-ball, gymnastics, rural dances and games and horse racing, the winners in which received valuable prizes. They continued from about the year 1604 until three years after the death of Dover, which took place in 1641. They were revived for a brief period in the reign of Charles II.

DOVER, a seaport and municipal borough in the Dover Parliamentary division of Kent, England, one of the Cinque Ports, 76 mi. ESE of London by the Southern railway. Pop. (est. 1938) 39,950. Area, 5.7 sq. mi. It is situated at the mouth of a small stream, the Dour, whose valley here breaches the high chalk cliffs which fringe the coast on either hand. The dominant object is the castle, on the east height, 375 ft. above sea level. Within its precincts are a Roman pharos or lighthouse, still exhibiting the Roman masonry, the ancient fortress church (St. Mary in Castro), some remains of the Saxon fort, and the massive keep and subsidiary defenses (such as the Constable's, Avranche's, and other towers) of the Norman building. The church, substantially unaltered, forms an almost unique Christian relic. It has been called Roman, but is later. It is cruciform in shape, and the walls are built mainly of flint, but jambs and arches are formed of Roman bricks. At the end of the 12th century it was remodelled and given an Early English character. In the beginning of the 18th century it was dismantled and turned into a storehouse, and so continued until 1863, when, having been restored by Sir G. G. Scott, it was again opened for divine service, and is now the chapel of the castle garrison.

The castle is probably of extremely early origin. The earthworks on the line of the outer curtain may be British, or even Roman, or may possibly represent the Saxon "burg" which Harold is said to have constructed. To these early banks and ditches, with perhaps stockades and wooden towers the conqueror added according to William of Poitiers, such additional "firmamenta" as were needful. This probably means a Norman "motte and bailey", and a moat, and in part a bailey, still remain inside the earlier castrum. The moat is unusually big, and the bailey, south of it, had an unusual loop to the southeast apparently to include the already extant church and pharos. Henry II is responsible for the first stone fortification. He encircled the Norman moat with a wall and crowned it with a keep. Finally the outer rampart was translated into stone, with a line of at least 17 towers at intervals in the time of Henry III, perhaps by Hubert de Burgh. The small inner ward, on the moat, has an area of about two acres, the Norman bailey about four, the whole castrum enclosing about 34 acres. Though the castle has suffered many alterations for modern military requirements, especially during the scare of a Napoleonic invasion, which have much obliterated the walls of the middle ward, the remainder of the castle stands substantially as it stood in the time of Henry III. With the exception of the Tower of London, it is probably at once the largest, most complete and most complex example of mediaeval fortification. Nine wards named in a list of Dover wards and their fees, dated 1211-12, in the Red Book of the exchequer, are all reproduced in names still attached to towers. These names had become fixed probably not later than the reign of Henry II. The constableness was attached to the honour of Haughley, known in consequence as the honour of the constable. It reverted to the crown on the forfeiture of Henry of Essex in 1163. At the time of Domesday it was held by Hugh de Montfort. The constableness later was held jointly with the lord wardenship of the Cinque Ports.

Remains were discovered in 1854 of a round church of the Templars (Holy Sepulchre), 32 ft. in diameter, which has been restored, the church, doubtless, in which King John made his submission to the papal nuncio in 1213. Archcliffe fort lies to the southwest of old Dover. There is a remnant of the Saxon collegiate church of the canons of St. Martin. The remains of the splendid foundation of St. Martin's priory, of the 12th century, include the great gate, the house refectory, with campanile, and the spacious strangers' refectory, now incorporated in Dover college. The college of St. Martin for 22 secular canons, which had been established in the castle before 640, was removed to the church of St. Martin in the town in 696, and in 1136 became a Bene-

dictine priory under the jurisdiction of that at Canterbury, to which see the lands are still attached. The interior of the refectory is very fine and on its east wall are remains of a 12th century mural painting of the Last Supper, some of the nimbi surrounding the heads may still be made out. King Stephen is said to have died in the priory guesthouse, which is the chapel of the modern college. The gatehouse, now the library of the college is a good piece of Decorated work, and has a fine open fireplace. In High street may be seen the noble hall and truncated fabric of the Maison Dieu founded by Hubert de Burgh in the 13th century for the reception of pilgrims of all nations. From the time of Henry VIII to 1830 it was used as a crown victualling office, but was subsequently purchased by the corporation and adapted as a town hall. The new town hall adjoining the old hall of the Maison Dieu was opened in 1883. The museum (1849) contains an interesting collection of local antiquities and a natural history collection. A bell taken from Antwerp by the Germans during World War I and used as an air raid warning at Zeebrugge was presented to Dover by the king of the Belgians and hung in a turret outside the town hall.

During World War II Dover suffered from constant "hit and run" air raiding, as well as shelling from Cape Gris Nez. To the end of 1941 about 9,000 houses had been damaged, also the parish church of St. Mary the Virgin (rebuilt and enlarged in 1843-44, but preserving the three bays of the Saxon church with its western narthex, on which was superimposed the Norman tower, whose rich front faced the street, the rest of the building was Norman and Early English), and the churches of St. James-the-Less (originally Norman, but vigorously restored) and St. Barnabas.

Among various charitable institutions are the National Sailors' home and the Gordon Boys' and Victoria Seaside orphanages. Among educational establishments is Dover college, occupying the site and remaining buildings of St. Martin's priory, with additional modern buildings. It was instituted in 1871, and educates about 220 boys. There is a separate junior school.

Dover is the only one of the Cinque Ports which is still a great port. It is one of the principal ports for passenger communications across the channel, steamers connecting it with Calais and Ostend. The Admiralty pier was completed to a length of about 2,000 ft. in 1871. The construction of a new commercial harbour was begun in 1893. The works included the east pier ("Prince of Wales's pier" completed, 1902), running parallel to the general direction of the Admiralty pier, and in conjunction with it enclosing an area of sheltered water of 75 ac. The Admiralty harbour, begun in 1896, has an area of 610 ac. of which 322 ac. have a depth of not less than 30 ft. at low water. It comprises three enclosing breakwaters—on the west an extension of the Admiralty pier in a southeasterly direction for 2,000 ft., on the south an isolated breakwater, 4,200 ft. long, curving round shoreward at its eastern end to accord with the direction of the third breakwater, on the east, which runs out from the shore in a southerly direction for 3,350 ac. These three breakwaters, with a united length of more than 1½ mi., are each built of massive concrete blocks in the form of a practically vertical wall rising to a quay level of 10 ft. above high water. There are two entrances, one 800 ft. and

Saxon shore (*Latus Saxonum*). As a Cinque Port, Dover (*Dofra, Dovorra*) contributed 20 of the quota of ships furnished by those ports. A charter of liberties was granted to the ports as a body by Edward I in 1278, confirming charters of Henry II and John, which in the case of Dover had conferred privileges enjoyed by the town in the time of Edward the Confessor and later kings. Edward I's charter was confirmed by subsequent kings with additions, down to James II. During the middle ages Dover castle was an object of contention both in civil wars and foreign invasions, and was considered the key to England. It was successfully defended in 1216 against the French under the dauphin Louis by Hubert de Burgh. In 1658 Charles II confirmed to the inhabitants of Dover a fair beginning on Nov. 11, which had been held of old in the town, and granted two others on April 23 and 24 and on Sept. 25 and 26. After the decay of Richborough harbour the passage from Dover to Whitland, and later to Calais, became the accustomed route to France, and by a statute of 1465 no one might ship for Calais except at Dover. The guardians of the harbour were incorporated by James I in 1607.

See S. P. H. Statham, *History of the Castle, Town and Port of Dover* (1899), and *Dover Charters and Other Documents* (1902).

Battle of Dover—This famous and important naval victory was won off the town of Dover by the ships of the Cinque Ports on Aug. 21, 1217, during the minority of King Henry III. The barons, who were in arms against his father King John had called Louis, son of Philip Augustus, king of the French, to their aid. Having been recently defeated in Lincoln, they were hard pressed, and reinforcements were sent to them from Calais in a fleet commanded by a pirate and mercenary soldier called Eustace the Monk. He passed the Straits of Dover with a numerous flotilla laden with military machines and stores, and also carrying many knights and soldiers. The Monk's fleet was seen from Dover where the regent, Hubert de Burgh, lay with the naval force of the Cinque Ports, said to have been very small. Sixteen vessels, large for that time, and a number of smaller craft, is said to have been their total strength. It put to sea, and by hugging the wind gained the weather gage of the French adventurer.

Eustace is said to have been under the impression that they meant to attack Calais in his absence, and to have denied them because he had left the town well guarded. When they were to windward of his fleet the Cinque Port ships bore down on the enemy. As they approached they threw unslaked lime in the air and the wind blew it in the faces of the French. This form of attack, and the flights of arrows discharged by the English (which flew with the wind), produced confusion in the crowded benches of the French vessels, which in most cases must have been little more than open barks. The Monk was defeated, and his fleet was entirely scattered, sunk or taken. His own vessel was captured. Eustace, who had concealed himself in the bilge, was dragged out. In answer to his appeals for quarter and promises to pay ransom, he was told by Richard, the bastard son of King John, that he was a traitor who would not be allowed to deceive more men. His head was struck off by Richard, and was sent round the ports on a pike. The Cinque Port seamen returned in triumph, towing their prizes, after throwing the common soldiers overboard, and taking the knights to ransom according to the

age. The political importance of the battle was to give the deathblow to the cause of the barons who had rebelled against the king, and it secured Henry III on his throne. But the victory of the Monk was widely regarded as a victory over the powers of evil. The man became a hero, and years after his death the hero of many legends.

The fact is less picturesque, but enough is known of Eustace the Monk that he was an adventurous and unscrupulous scoundrel. He was a monk, and left the cloister to claim an inheritance in the count of Boulogne. Not having received the inheritance he became a freebooter on land and sea, and merited his name. He is frequently mentioned in the Pipe, Patent and Close Rolls. For a time he served King John, but when the king made friends with the count of Boulogne, he fled abroad and entered the service of the French prince Louis and his father

Dover (*Dubris*) was one of the ports for continental traffic in Roman times. In the 4th century it was guarded by a fort lying down near the harbour, and forming part of the defenses of the

Philip Augustus Chroniclers lavish on him the titles of "*archipræta*," "*vir flagitiosissimus et nequissimus*," and poets made him an associate of the devil

The evidence concerning Eustace is collected by Herren Wendehin Forster and Johann Tröst, in their edition of the French poem "*Wastasse le moine*" (Halle, 1891). See for the battle Sir N Harris Nicolas, *History of the Royal Navy* (London, 1847).

The Dover Patrol—Dover harbour provided the headquarters of the Dover Patrol during World War I. The area of the Patrol extended roughly from the North Foreland to Bexley Head, including both sides of the Channel. The functions of the Patrol were, primarily, to keep the narrows of the Channel open to traffic. London could not be fed by rail alone. Had sea traffic to London been stopped it would have been necessary at once to transport one third of the population to the west coast. The traffic had to be protected from mines, submarine boats and destroyer attacks. On an average 66 trawlers were used for mine sweeping and traffic duties, approximately 100,000 merchant vessels passed during 1915-17 inclusive, and of these only 48 were mined and 7 torpedoed, the percentage loss for the three years was 0.35, 0.8 and 0.66 respectively, 5,614,500 troops were transported between Folkestone and Boulogne without a single casualty or accident. Nine and a half million mail bags were sent without the loss of a single letter or parcel.

The next important duty of the Patrol was hunting submarines. At first these vessels passed down the straits on the surface, diving only when they were sighted. It was then simple to attack them. After 1915 they dived when well to the eastward and passed the narrows entirely submerged. Many schemes were tried to defeat them, and as soon as mines became available a barrage of mines moored at various depths was laid between Folkestone and Gris Nez. This was nearly completed by January 1918 and the first submarine was destroyed in it in December 1917. This in the end completely stopped the passage of submarines and destroyed a considerable number of them.

At the commencement of the war the Dover Patrol force operated with the army in checking the German advance through Belgium by their gun fire and made the shore road difficult for the Germans to use. Subsequently the Patrol was called on to defend the sea flank of the army and by feints of landings to draw troops from the main offensive to the coast. To assist in the advance which was contemplated in 1917 three 12 in guns, seven 9.2 and eight 7.5 in guns were landed and mounted, at the same time arrangements were made for landing 20,000 men on the coast between Ostend and Westend. Pontoons 55 feet long loaded with men and accessories were constructed to be pushed ahead of the monitors on to the beach. This landing was never carried out, as the commander-in-chief did not consider it advantageous to land troops until the army had reached Roulers. It never pushed on beyond the Passchendaele Ridge. The only attacks by the enemy prior to 1918 on the Dover defences were those made by destroyers at night. Darkness and surprise coupled with the meagre allowance of destroyers for Dover was insignificant, the difficult to cope with, but the damage done was insignificant, the total losses being two merchant vessels (one empty), two destroyers and six drifters. During the fourth raid the *Broke* and *Smyth* sank two German destroyers, and for a time the raids ceased. During 1918 a last raid was made on the vessels protecting the mine barrage and several were sunk.

An examination service for the detection of contraband was established in the Downs. All North and South going traffic had to anchor and be examined. This work was largely undertaken by Naval Reserve officers under a post captain. In 1917, when raids by German destroyers threatened the safety of the vessels in the Downs, the Northern examination service was moved inside the Thames shoals.

Vessels at Dover were also called on to undertake bombardments of the dockyard at Ostend and the submarine base at Zeebrugge. The result of these operations was that the dockyard was made untenable and the destroyers and submarines forced up the canal to Bruges. In 1916 the aircraft were used for spotting with successful results, several of the bombardments being carried out without the Belgian coast being sighted by the

ships. The force of destroyers available at Dover before 1917 was very small having regard to the duties they were called on to perform, only six mounted 4-in guns. During the latter year they were augmented. Of the 12 Tribal class half were mined or torpedoed. A constant patrol was kept up eight miles off the Belgian coast during the summer months of 1916-17. This was made possible by first laying down the barrage of mines and mined nets seven miles from the coast to protect the ships from attack on the shore side. The only ship damaged while on patrol was the monitor *Terror* which was struck by a boat controlled electrically from the shore.

Blocking operations were carried out during 1918 when Zeebrugge was attacked and blocking ships skillfully sunk in the Channel which however owing to its physical formation was not, and could not be, effectively blocked. A similar attempt on Ostend failed, though attempted with great gallantry. The drifters like the trawlers were invaluable in the English Channel, first drifting nets to entangle submarines, then watching the barrages. On the Belgian coast they laid 12 miles of armoured mine nets for two years in succession. The motor launches also were of considerable value for sundry services, especially burning smoke screens to hide the ships bombarding. These screens were necessary since the effective range of the monitors' guns was only about 75% that of the shore batteries. The French naval armaments on the north coast of France were under the orders of the Admiral of the Dover Patrol and did excellent service throughout the war. The air service at Dunkirk was also one of the arms of the Patrol and was invaluable both on the coast and also in assisting the army, notably at the battle of the Somme when the army was very deficient in aircraft. Without the breakwater and harbour facilities at Dover the protection of the straits would have been impossible, and the evacuation of the wounded most difficult. Almost all wounded at the front were safely landed at Admiralty pier and from there despatched to various hospitals.

DOVER, the capital city of Delaware, U.S.A., and the county seat of Kent county, on the St. Jones river, in the central part of the state. It is on federal highway 13, and is served by the Pennsylvania railroad. The population was 6,223 in 1950 and 5,517 in 1940 by the federal census. The state house, built about 1722 for a courthouse and remodelled in 1791 for its present purpose, is a beautiful building of dignified colonial architecture, set in a spacious green. Near Dover still stands the home of Caesar Rodney (1728-84), who rode to Philadelphia through the night of July 3, 1776, in order to be present at the roll call on the Declaration of Independence, and thus made possible a unanimous vote of the 13 Colonies in favour of its adoption. Dover is a shipping point for the strawberries, apples, peaches, grapes, poultry, vegetables and other products of the fertile surrounding country, and has many canneries and packing plants, including one of the oldest and largest in the country (established 1855). The state college for Negro students (1892) is located there. Dover was laid out in 1717, by order of William Penn. In 1777 it replaced New Castle as the capital of the state. It was incorporated as a town in 1829, and reincorporated as a city in 1925 with an area almost double its former size.

DOVER, a city of southeastern New Hampshire, on the Cochoeco river, 10 mi. NW of Portsmouth, the county seat of Strafford county. It is served by the Boston and Maine Railroad and motorbus lines. The population was 15,911 in 1950 and 14,990 in 1940 by the federal census. It has abundant water power and large manufacturing industries. Leading products are woollen and worsted goods, printing presses, leather belting, shoes, window frames, chemicals, television parts, lumber, cement blocks, optical goods, cameras and films. A settlement was established in 1623 by Edward Hilton on Dover point, 5 mi. SE of the Cochoeco falls, and in 1633 several families under Capt. Thomas Wiggan settled on Dover neck (on the Piscataqua river, 1 mi. above Dover point) which for the first century, while shipbuilding was the important occupation, was the business centre of the town. With the development of manufacturing, business and population shifted to the Cochoeco river, which is now the centre. For nearly half a century after 1641 the plantation (by will of the majority) was

under the jurisdiction of Massachusetts. Between 1675 and 1725 the town suffered greatly from attacks by the Indians, notably on June 28, 1689. Dover was chartered as a city in 1855. At Durham, 5 mi. SW, is the University of New Hampshire, established as an agricultural college in 1866, at Hanover, moved to Durham in 1893, following the death of Benjamin Thompson, a farmer of that town, who left to the college almost his entire estate, and incorporated as a university in 1923.

DOVER, a town of Morris county, N.J., on the Rockaway river, 40 mi. WNW of Jersey City, at an altitude of 570 ft. It is served by the Lackawanna railway. The population was 11,210 in 1950, in 1940, 10,491. Iron is mined in the vicinity, and the town has large railroad shops and important manufactures, including hosiery, silk, bar iron, furnaces and ranges, boilers, bridges, drills and air compressors. Dover was founded in 1722, when Joseph Jackson started an iron forge where the modern Hurd Park is located. Dover's progress was closely associated with the iron industry, and its iron products became known throughout the world.

DOVER, a city of Tuscarawas county, O. U.S., on the Tuscarawas river, 82 mi. SE of Cleveland. It is on federal highways 21 and 250, and is served by the Baltimore and Ohio and the Pennsylvania railroads. The population was 9,787 in 1950 and 9,691 in 1940 by the federal census. The city lies on a plateau 884 ft. above sea level, commanding diversified views. Iron ore, coal, freclay and limestone abound in the vicinity. The manufactures include electric irons, sweepers, stearic acid, bronze tubes, steel, buckets, tubs, stoves, tungsten wire, floor and wall tile. A town was laid out in 1807. It was on the Ohio canal (opened 1832) and was formerly called Canal Dover, but "Canal" was dropped in 1915.

Dover was incorporated as a village in 1842, reincorporated in 1867 and became a city in 1903.

DOVER, TREATY OF A secret treaty concluded on May 22, 1670 between Charles II of England and Louis XIV of France, whereby Charles II agreed to embrace the Roman Catholic faith and try to restore Catholicism in England. The king of France was to assist him in restoration with a large sum of money and the use of 6,000 troops. It was agreed that the two countries should declare war jointly on the United Provinces, and also that England should support the claim of Louis, should he "acquire new titles and rights to the Spanish Monarchy." The treaty was negotiated through Henrietta, Duchess of Orleans and sister of Charles II (See CHARLES II).

The treaty did not however become operative as such owing to the religious controversy involved, in a later version (Dec. 1670) the proposed conversion of the English king was omitted in order to deceive the ministers who were not in the Catholic plot and a date fixed for the declaration of war against the United Provinces.

DOVERCOURT, a water-cure place and parish in the borough of Haverhill, Eng., and with a station on the L.N.E.R. 10 mi. N.E. from London. The esplanade and park will from the North and there is a fine example of a modern attention has been given to building out public walks and gardens and providing recreation facilities. There is also a cricket ground. The scenery of the neighbouring Orwell and Stour is attractive. The church, which stands inland in the old village, is a fine building. As Upper Dovercourt is fairly fresh it is formerly possessed a "miraculous rood" which became an object of pilgrimage. It is said to have been stolen and burnt in 1532, three of the four thieves being subsequently taken and hanged.

DOW, NEAL (1804-1897), American temperance reformer, was born at Portland, Me., March 20, 1804. He drafted the Maine prohibitory law of 1851. He was mayor of Portland, 1851, 1855, a member of the Maine legislature, 1853-59, and in the Civil War colonel of the 13th Maine Volunteer Infantry.

He served in General B. F. Butler's New Orleans expedition, was commissioned brigadier general of volunteers in April 1863, and commanded for a time the department of Florida. After the war he devoted a great part of his time to the extension of prohibition in America and England. Through his exertions the prohibitory amendment was added to the Maine Constitution in

1884. He died at Portland, Oct. 2, 1897.

His *Reminiscences* were published at Portland in 1898.

DOWAGER, strictly, a widow in the enjoyment of dower. "Dowager" is also applied to widows of high rank to distinguish them from the wives of their sons, as queen dowager, dowager-duchess, etc. The title was first used in England of Catherine of Aragon, widow of Arthur, prince of Wales, who was styled princess dowager till her marriage with Henry VIII. By transference the word is used of an elderly lady.

DOWAGIAC, a city of Cass county, Mich., in the southwest corner of the state, on the Michigan Central railroad. The population was 6,534 in 1950 and was 5,007 in 1940 by the federal census. It is in a fertile region of many lakes. The city manufactures furnaces and fish bait, ships wheat, corn, fruit, celery, pepper mint and other agricultural products, and is a summer resort and touring centre. It was founded about 1838 and incorporated in 1852.

DOWDEN, EDWARD (1843-1913), Irish critic and poet, was born at Cork and educated at Queen's college, Cork, and Trinity college, Dublin. He became professor of English literature at Trinity college in 1867. His first book, *Shakespeare, his Mind and Art* (1875), a revision of a course of lectures, was translated into German and Russian, and his *Poems* (1876) went into a second edition. His *Shakespeare Primer* (1877) was also translated into Italian and German. Later works by him in Shakespearean criticism were his *Shakespeare's Sonnets* (1881), *Passionate Pilgrims* (1883), *Introduction to Shakespeare* (1893), and editions of *Hamlet* (1899), *Romeo and Juliet* (1900) and *Cymbeline* (1903). His *Studies in Literature* (1878), *Transcripts and Studies* (1888), *New Studies in Literature* (1895), and other works, many of them biographical, showed a profound knowledge of the currents and tendencies of thought in various ages and countries, but it was his *Life of Shelley* (1886) that made him best known to the public at large. In 1900 he edited an edition of Shelley's works. In 1889 he became the first Taylorian lecturer at Oxford, and from 1892 to 1896 was Clark lecturer at Trinity college, Cambridge.

DOWER, in law, the life interest of the widow in a third part of her husband's lands. There were originally five kinds of dower: (1) at common law, (2) by custom, (3) *ad ostium ecclesiae*, or at the church porch, (4) *ex assensu patris*, (5) *de la plus belle*. The last was a conveyance of tenure by knight service, and was abolished in 1606, by the act which did away with old tenures. Dower *ad ostium ecclesiae*, by which the bride was dowered at the church porch (where all marriages used formerly to take place), and dower *ex assensu patris*, by the father of the bridegroom, though long obsolete, were formally abolished by the Dower act 1834. Dower was governed in Great Britain, so far as women married after Jan. 1, 1834 were concerned, by the Dower act 1834, and under it only attached on the husband's death to the lands which he actually possessed for an estate of inheritance at the time of his death. It did not attach to any land actually disposed of by him in his lifetime or by his will, or to any land from which he declared by deed or will his wife should not be entitled to dower. Dower was finally abolished by the Administration of Estates act 1925. The right to dower still obtains in some colonies, while in others it has been superseded by Homestead acts, or the acts dealing with devolution of property (see *Burge's For and Col Laws*, vol. iv pt. 11 Wyndham A. Bewes ed.).

In the United States, in such States as have not enacted statutes to the contrary, dower continues as at common law. Some statutes are in effect which declare the principles of the common law. In most States, however, the common law doctrines of dower have been very greatly modified by statute. In some States dower either has been abolished or a different right or interest has been substituted therefor. Even where it has been abolished, the term often popularly is used. Where dower is abolished the interest substituted may be in one of several forms, perhaps a certain portion of the husband's property or of the community property of both or of a life estate in a portion of his realty.

DOWIE, JOHN ALEXANDER (1847-1907), founder of the "Christian Catholic Apostolic Church in Zion," born in Edin-

burgh, and went as a boy to Australia with his parents. He returned in 1868 to study for the Congregationalist ministry at Edinburgh University, and subsequently became pastor of a church near Sydney, Australia. Imbued with belief in his powers as a healer of disease by prayer, he moved to Melbourne, where he founded "The Divine Healing Association of Australia and New Zealand." In 1888 he went to America, preaching and "healing," and in spite of opposition and ridicule attracted a number of adherents. In 1896 he established "The Christian Catholic Apostolic Church in Zion," with himself as "First Apostle"; and in 1901, with money liberally contributed by his followers, he founded Zion City, on a site covering about 10 sq m on the west shore of Lake Michigan, with a central Zion Temple. In 1903 and 1904, in the course of a visit to the branches of the Christian Catholic Church throughout the world, he appeared in London, but was mobbed. In April 1906 a revolt against his domination took place in Zion City. He was charged with pecculation and with practising polygamy, and was deposed, with the assent of his own wife and son. Downe was now broken in health, he was struck with paralysis and died in Zion City in March 1907. Downe was succeeded by Wilbur Glenn Voliva.

DOWLAS, plain cloth, similar to sheeting, but usually coarser. It is made in several qualities, from line warp and weft to two warp and weft, and is used chiefly for aprons, pocketing, soldiers' gaiters, linings and overalls. The finer makes are sometimes made into shirts for workmen, and occasionally used for heavy pillow cases. The word is spelt in many different ways, but the above is the common way of spelling adopted in factories, and it appears in the same form in the first part of Shakespeare's *Henry IV*, Act III scene 3. The modern dowlas is a good strong and closely woven linen fabric.

DOWN, a maritime county of Northern Ireland, occupying the most easterly part of the island, bounded N by Co. Antrim and Belfast Lough, E and S by the Irish sea, and W by Co. Armagh. The land area is 952.2 sq mi. Pop. (1937) 210,687.

The foundation of this county is Silurian rock throughout, the slates and sandstones striking as a whole north east, but giving rise to a country of abundant small hills. The granite that appears along the same axis in Armagh continues from Newry to Slieve Croob, furnishing an excellent building stone. South of it, the Eocene granite of the Mourne forms a group of rocky summits, set with scarps and tors, and divided by valleys, which are not yet choked by the detritus of these comparatively youthful mountains (Slieve Donard 2,796 ft.). Lower lands occupy the east, north and large portions of the west of the county. Basalt dykes abound, being well seen along the coast south of Newcastle. At the head of Strangford Lough, the basalt, possibly as intrusive sheets, has protected Triassic sandstone, which is quarried at Scrabo hill. A strip of marine Permian occurs on the shore at Holywood. The north west of the county includes, at Moira, a part of the great basaltic plateaus, with Chalk and Trias protected by them. The chief drainage is to the river Lagan in the north, and to the Bann and the Newry on the west. The period at which Down was constituted a county is not certain. A district, however, appears to have borne this name before the beginning of the 14th century, but little is known of it even later than this.

Down is a county of great natural beauty, and is one of the most fertile in Ireland. The soil is generally of a rich, deep, brown, loamy, and is well adapted for the raising of corn, and other crops. The county is well watered, and is one of the most fertile in Ireland. The soil is generally of a rich, deep, brown, loamy, and is well adapted for the raising of corn, and other crops. The county is well watered, and is one of the most fertile in Ireland.

On the summit of a hill near the borders of Antrim. This altar is in the centre of an enclosure about a third of a mile in circumference, formed of a rampart about 15 ft. high, and broad enough on the top to permit two persons to ride abreast. Near Down

patrick is a Rath, or encampment, three quarters of a mile in circumference. In its vicinity are the ruins of Saul abbey, an Augustinian friary founded about 1130 on the site of St. Patrick's first church, and Inch abbey, founded by Sir John de Courcy in 1180. The number of monastic ruins is also considerable. The most ancient and celebrated is the abbey or cathedral of Downpatrick. Dundrum castle attributed to the de Courcy family, stands above that town, and affords an unusual example (for Ireland) of a donjon keep. The castle of Hillsborough, seat of the marquesses of Downshire is of Carolan date. There are three round towers in the county, but all are fragmentary.

The predominating soil is a loam of little depth, in most places intermixed with considerable quantities of stones of various sizes, but differing materially in character according to the nature of the subsoil. Clay is mostly confined to the eastern coast, and to the northern parts of Castlerough. Of sandy soil the quantity is small, it occurs chiefly near Dundrum. Moor grounds are mostly confined to the skirts of the mountains. Bogs, though frequent, are scarcely sufficient to furnish a supply of fuel to the population. Agriculture is in a fairly satisfactory condition. The bulk of the labouring population dwells in reasonably good circumstances. Tillage land declines somewhat in favour of pasture land. Oats, potatoes and turnips are the principal crops, flax, formerly important, is almost neglected. Some of the best racehorses in Ireland have been bred in this county. The native breed of sheep is confined to the mountains. The various other kinds of sheep have been much improved. Pigs are reared in great numbers, chiefly for the Belfast market. Poultry farming is a growing industry. The fisheries, of less value than formerly, are centred at Donaghadee, Newcastle, Strangford and Ardglass. The chief industries in the county generally are linen manufacture and bleaching, and brewing.

The haematite of Dechommed, near Banbridge, is well spoken of. Topaz and aquamarine occur in hollows in the granite of the Mourne. The Mourne granite is quarried above Annalong, and an ornamental dolerite is worked at Rosstrevor.

The Great Northern railway has an alternative branch to its main line by Portadown, from Lisburn through Banbridge to Scarva, with a branch from Banbridge to Ballyronney and Newcastle. Newry is on a branch from the Dublin Belfast line to Warrenpoint on Carlingford Lough. The main line between Lisburn and Portadown touches the north western extremity of the county. The eastern part of the county is served by the Belfast and County Down railway with its main line from Belfast to Newcastle, and branches from Belfast to Bangor, Comber to Newtownards and Donaghadee, Ballynahinch Junction to Ballynahinch, and Downpatrick to Ardglass and Killybegs. The Newry Canal skirts the west of the county, and the Lagan Canal intersects the rich lands in the Lagan valley to the north.

Bangor is the largest town, though Downpatrick is the county town. Bangor and Newtownards are municipal boroughs and there are nine urban and eight rural districts in the county and eight Poor Law unions. There are several watering places on the coast. Co. Down returns eight members to the parliament of Northern Ireland and two members to the United Kingdom parliament.

DOWN, an expanse of high rolling ground destitute of trees occasionally used for a smooth rounded hill. The system of chalk hills in England is known as "The Downs" (see **DOWNES**). The usual English word "dune" is taken directly from the French. Low sandy tracts north and south of Yarmouth, Norfolk, are known as the "Dunes." The adverb "down," meaning, from above, had an earlier form "adown," i.e., off the hill.

DOWNES (D[O]UNAUS), **ANDREW** (c. 1540-1618), English classical scholar, was born in Shropshire. He did much to revive the study of Greek at St. John's college, Cambridge, and was elected fellow in 1571. In 1585 he was appointed regius professor of Greek. According to Simonds d'Ewes (*Autobiography*, ed. J. O. Halliwell, i. pp. 139, 141), who attended his lectures, Downes was accounted "the ablest Grecian of Christendom." He edited *Lysias Pro caede Erastosthenis* (1593), *Prælectiones in Philippiam de pace Demosthenis* (1612), dedicated to King James I., some letters (in Greek) to Isaac Casaubon

printed in the *Epistolae* of the latter, and notes to St Chrysostom, in Sir Henry Savile's edition. Downes was also one of the seven translators of the *Apocrypha* for the "authorized" version of the Bible, and one of the six learned men appointed to revise the new version after its completion.

DOWNING, SIR GEORGE, BART (c 1624-1684), English soldier and diplomatist, son of Emmanuel Downing, barrister, and of Lucy, sister of Governor John Winthrop, was born in Salem, Mass., and Downing studied at Harvard. In 1645 he sailed for the West Indies as a preacher and instructor of the seamen, and arrived in England some time afterwards, becoming chaplain to Colonel John Okey's regiment. In 1650 he was scout-master general of Cromwell's forces in Scotland, in Cromwell's parliament of 1654 he represented Edinburgh, and Carlisle in those of 1656 and 1659. In 1655 he was sent to France to remonstrate on the massacre of the Protestant Vaudois. Later in 1657 he was appointed resident at The Hague, to effect a union of the Protestant European powers, to mediate between Portugal and Holland and between Sweden and Denmark, to defend the interests of the English traders against the Dutch, and to inform the government concerning exiled royalists.

He was maintained in his post during the interregnum after the fall of Richard Cromwell, and in April 1660 made his peace with Charles II, to whom he communicated Thurloe's despatches, and declared his abandonment of "principles sucked in" in New England, of which he now "saw the error." Downing was knighted in 1660. He showed indelible zeal in restoring in Holland and handing over for execution the regicides Barkstead, Corbet and Okey. In 1661, he was created a baronet. Downing had from the first been hostile to the Dutch as the commercial rivals of England. He had strongly supported the Navigation Act of 1660, and he now deliberately drew on the fatal and disastrous war. During its continuance he took part in the management of the treasury, introduced the appropriation of supplies, and in May 1667 was made secretary to the commissioners, his appointment being welcomed by Pepys. He sat in parliament for Morpeth from 1660 till his death, and spoke with ability on financial and commercial questions. He was appointed a commissioner of the customs in 1671. The same year he was sent to Holland to replace Sir William Temple, to break up the policy of the Triple Alliance and incite another war between Holland and England in furtherance of the French policy. After three months' residence Downing fled to England, in fear of the fury of the mob. For this unauthorized step he was sent to the Tower for some weeks. Downing Street, London, is named after him, while Downing College, Cambridge, derived its name from his grandson, the 3rd baronet. The title became extinct when the 4th baronet, Sir Jacob G. Downing, died in 1764.

Downing's great talents were rarely employed for the advantage of his country and his character was marked by treachery, servility and ingratitude. "A George Downing" became a proverbial expression in New England to denote a false man who betrayed his trust. He published many declarations and discourses, mostly in Dutch, enumerated in Sibley's biography, and wrote also "A True Relation of the Progress of the Parliament's Forces in Scotland" (1652), *Thomasian Tracts*, Brit. Mus., E. 640 (5).

See J. L. Sibley, *Biographical Sketches of Harvard* vol. 1 (Cambridge, 1873), J. Beresford, *The Godfather of Downing Street*, Sir G. Downing (1897).

DOWNINGTOWN, a borough of Chester county, Pa., U.S.A. on Brandywine creek, 3 1/2 m. W. of Pottsville. It is situated on the Delaware river, and is one of the most important manufacturing centers of the State. It is the seat of the Chester County Court, and has a large population. It is the seat of the Chester County Jail, and has a large number of shops and factories. It is the seat of the Chester County Prison, and has a large number of shops and factories. It is the seat of the Chester County Jail, and has a large number of shops and factories. It is the seat of the Chester County Prison, and has a large number of shops and factories.

DOWNMAN, JOHN (1853-1894), L. Esq. born in the parish of St. Mary, London. He was a member of the House of Commons, and was a member of the House of Commons. He was a member of the House of Commons, and was a member of the House of Commons. He was a member of the House of Commons, and was a member of the House of Commons. He was a member of the House of Commons, and was a member of the House of Commons.

Downman is believed to have been "pressed" for the navy as a young man, and on his escape settled down for a while in Cum bridge, eventually coming to London, and later (1804) going to reside in Kent in the village of West Malling. He afterwards spent some time in the west of England, especially in Exeter, and then travelled all over the country painting his dainty portraits.

See G. C. Williamson, *John Downman, his Life and Works* (1907).

DOWNPATRICK, market town, urban district and county town of Co. Down, Northern Ireland, 28 m. S.E. of Belfast by rail. Pop. (1937) 3,373. Area, 4 sq. m. It stands near the S.W. extremity of Strangford Lough. It is the seat of the Roman Catholic and Protestant dioceses of Down. St. Patrick founded the see about 440, but the present Protestant cathedral dates from 1790, the old structure having been in ruins for 250 years. A round tower adjoining it was destroyed in 1790. The Rath or dun, from which the town is named, remains as one of the finest in Ireland. It is known as the Mound of Down and covers 10 acres. In the vicinity are remnants of the monastery of Saul, a foundation ascribed to St. Patrick, and where he died, and of Inch abbey (1180), founded by Sir John de Courcy. Three miles south is a stone circle and to the S.E. are the wells of Struill. The town was called *down-leth-plas*, the fort of the broken fetters, from the deliverance from bondage of two sons of Dicu, prince of Lecale, and the first convert of St. Patrick. It is the Dunum of Ptolemy and was the residence of the kings of Ulster. It was already incorporated early in the 15th century. A small trade is carried on at Strangford Lough, the quay being below the town. Industries are linen manufacture, brewing, tanning and soap-making.

DOWNS, the name of a system of chalk hills in the south east of England. It is most familiar in its application to the two ranges of the North and South Downs. Of these the North Downs are in the counties of Surrey and Kent, and the South in Sussex. Each forms a well-defined long range springing from the chalk area of Dorsetshire and Hampshire, to which latter the general name of the Western Downs is given. The Downs enclose the rich district of the Weald (q.v.).

The North Downs extend for 95 m. from Farnham to the English channel between Dover and Folkestone. The crest is not continuous, as the hills are breached by a series of deep gaps, through which northward flowing rivers, roads and railways pass. The entrances to these gaps are the locations of important town sites. The South Downs show similar characteristics, the rivers flowing southward. The river system of the Weald is an excellent example of a drainage system consequent upon an anticlinal structure. The western end of the North Downs is the Hog's Back, a narrow ridge, altitude 489 ft., a quarter of a mile broad on the top and sloping sharply north and south. At the west end is a depression, once occupied by the Blackwater, the head-waters of which have been captured by the Weir. In this depression lies Farnham. The Wey, flowing south of the Hog's Back, breaches the Downs at the Guildford gap. The next gap is that of the Mole, in which Dorking lies. Between Guildford and Dorking the main line of the Downs reaches 712 ft., but a lateral depression, followed by the railway, marks off on the south a loftier range of lower Greensand, in which Leth hill is 905 ft. in height. East of the Mole the northward slope of the Downs is deeply cut by narrow valleys and the depression between Redhill and Croydon was once traversed by a stream subsequently beheaded by the Mole. A height of 868 ft. is attained east of Caterham. The next river to break through is the Darent, but here another lateral depression marks off the Ragstone ridge, south of Sevenoaks, reaching 800 feet. The lateral depression is continued eastward, so that as far as Ashford the Downs consist of two parallel ranges, but the Medway itself breaches both, Maidstone lying in the gap. The elevation now begins to decrease, and 684 ft. is the extreme height east of the Medway. The final breach is made by the Great Ouse, between Ashford and Canterbury, but the valley of the Little Ouse offers a well-marked pass followed by the Folkestone-Canterbury railway. The North Downs end in the white cliffs between Dover and Folkestone.

The South Downs present similar characteristics on a minor

scale. Springing from the main mass of the chalk, south of Peters field, they have their greatest elevation (889 ft in Butser hill), and extend for 65 m to the English channel at Beachy Head. Here also a succession of rivers breach the hills, and towns mark the gaps. These are, from east to west, the Arun, with the town of Arundel, the Adur, with Shoreham, the Ouse, with Lewes and Newhaven and the Cuckmere, with no considerable town. The steep slope of the South Downs is northward. The southern slopes reach the coast east of Brighton, but west of this town a flat coastal belt, the Hampshire basin, intervenes, widening westward. Apart from the complete breaches, the South Downs, scored on the south with many deep vales, are generally more easily penetrable than the North Downs, and the coast is less continuous.

Smooth convex curves are characteristic of the Downs, their graceful and striking outline gives them an importance in the landscape in excess of their actual height, their flanks are well wooded, their summits covered with close springy turf.

"The Downs" is also the name of a roadstead in the English Channel off Deal between the North and the South Foreland. It forms a favourite anchorage during heavy weather, protected, except during severe southerly gales, by the Goodwin Sands. It has depths down to 12 fathoms.

DOWNSHIRE, WILLIS HILL, 1st MARQUESS OF (1718-1793), son of Trevor Hill, 1st Viscount Hillsborough, was born at Fairford in Gloucestershire on May 30, 1718. He became a member of parliament in 1741. In 1751 he was created earl of Hillsborough in the Irish peerage, and in 1756 a peer of Great Britain as Baron Harwich. For nearly two years he was president of the Board of Trade and Plantations under George Grenville, and after a brief period of retirement he filled the same position, and then that of joint postmaster general, under the earl of Chatham. From 1768 to 1772 Hillsborough was secretary of State for the Colonies and also president of the Board of Trade, becoming an English earl on his retirement, in 1779 he was made secretary of State for the northern department, and he was created marquess of Downshire seven years after his final retirement in 1782. Both in and out of office he opposed all concessions to the American colonists, but he favoured the project for a union between England and Ireland. He died on Oct. 7, 1793.

DOWRY, the property which a woman brings with her or is given to her at her marriage, a wife's marriage portion (see SETTLEMENT).

DOWSER and **DOWSING**, one who uses, or the art of using, the dowsing rod or "striking-rod" to find subterranean minerals or water (from the Cornish "dowse," ME *duchen*, to strike or fall. See DIVINING-ROD). More commonly with the spelling "douse" the verb is also used, especially in nautical parlance, with the meaning to lower or strike sail suddenly, as well as to quench or extinguish, as a light, or to close, as a port hole.

DOWSON GAS PRODUCER. See GAS MANUFACTURE.

DOXOLOGY, an ascription of glory to God (Gr *δοξολογία*, a praising). The name is applied specially to the *Gloria in excelsis Deo* (known as the Greater Doxology) and the *Gloria Patri* (the Lesser Doxology, usually called "the doxology" simple), but also, more generally, to the *Tersanctus* ("Holy, Holy, Holy," often called *Trisagion*, though that is strictly the name of the Greek invocation beginning "Αγος δ Θεος"), to the Alleluia of Rev. xix and of many of the Psalms, to the last clause of the Lord's Prayer as found in Matt. vi. 13, and to such passages of glorification as Rom. xvi. 27, Eph. iii. 21, etc.

The Greater Doxology, in a slightly different form from that now used in the Greek Church, is given in the 4th century *Apostolical Constitutions* (vii. 47), and a very similar form is found in the Alexandrine Codex (5th century). The translation into Latin is traditionally attributed to St. Hilary of Poitiers (d. 367). The date of its introduction into the public services of the church cannot be determined precisely. In the Eastern Church it was used in the morning office apparently as early as the 4th century, but has never formed part of the Liturgy. In the West, where it is used in the Mass, Pope Symmachus (498-514) is said in the Liber Pontificalis to have ordered it to be sung on Sundays and festival days, it is mentioned in the Gregorian Sacramentary, but not

in the Gelasian. Until the 11th century its use was confined to bishops, and to priests at Easter and on their installation. In the English prayer book it comes near the end of the communion of fice, but is not in either the morning or evening service. It is also used in the Protestant Episcopal and Methodist Episcopal churches of America, as indeed in most Protestant churches at the Eucharist.

The Lesser Doxology, or *Gloria Patri*, in its present form, is the result of the Arian controversies concerning the nature of Christ. There is no trace of its use in the first three centuries, and the second clause, "As it was in the beginning," etc., first appears in A.D. 520, when the 2nd council of Vaison asserted its use as already established in the East *propter haereticorum astutiam*, and ordered its adoption throughout the West. In the Western Church the *Gloria Patri* is repeated at the close of every psalm, in the Eastern Church at the close of the last psalm. This last is the optional rule of the American Episcopal Church.

Metrical doxologies are often sung at the end of hymns, and the term has become especially associated with the stanza beginning "Praise God from whom all blessings flow," with which Thomas Ken, bishop of Bath and Wells, concluded his morning and evening hymns.

See J. Bingham, *Blog. eccles. xiv. 2*, Siegel, *Christl. Alterthümer*, i. 515, etc., F. Procter, *Book of Common Prayer*, p. 212, W. Palmer, *Orig. Liturg. iv. § 23*, art. "Liturgische Formeln" (by Drews) in Hauck *Herzog, Realencyc. fur prot. Theol. xi. 547*, *Cath. Encycl.*

DOYEN, GABRIEL FRANÇOIS (1726-1806), French painter, was born at Paris in 1726. He became in his 12th year a pupil of Vanloo, obtained at 20 the Grand Prix, and in 1748 set out for Rome. Among his greatest works are counted the "Miracle des Ardents," painted for the church of Ste. Geneviève at St. Roch (1773), the "Triumph of Thetis," for the chapel of the Invalides, and the "Death of St. Louis," for the chapel of the Military School. In 1776 he was appointed professor at the Academy of Painting. Soon after the beginning of the Revolution he accepted the invitation of Catherine II and settled at St. Petersburg, where he died on June 5, 1806.

DOYLE, SIR ARTHUR CONAN (1859-1930), English novelist, knighted in 1902, eldest son of the artist Charles Doyle, was born on May 22, 1859. He was educated at Stonyhurst College, in Germany, and at Edinburgh University where he graduated M.B. in 1881 and M.D. in 1885. He was practising as a doctor in Southsea when he published *A Study in Scarlet* in 1887. *Mycrae Clarke* (1888), a tale of Monmouth's rebellion, *The Sign of Four* (1889), and *The White Company* (1891), a romance of Du Guesclin's time, followed. In *Rodney Stone* (1896) he drew an admirable sketch of the prince regent, and he collected a popular series of stories of the Napoleonic wars in *The Exploits of Brigadier Gerard* (1896). In 1891 he attained immense popularity by *The Adventures of Sherlock Holmes*, which first appeared in *The Strand Magazine*. These ingenious stories of the success of the imperturbable Sherlock Holmes, who had made his first appearance in *A Study in Scarlet* (1887), in detecting crime and disentangling mystery, found a host of imitators. The novelist himself returned to his hero in *The Memoirs of Sherlock Holmes* (1893), *The Hound of the Baskervilles* (1902), and *The Return of Sherlock Holmes* (1905). Other books by him include numerous novels, plays, *The Story of Waterloo* (1894), in which Sir Henry Irving played the leading part, *The Fires of Fate* (1909), *The House of Temperley* (1909), *The Poison Belt* (1913), two books in defence of the British army in South Africa—*The Great Boer War* (1900) and *The War in South Africa, its Causes and Conduct* (1902). During World War I Doyle wrote propaganda for the Allies. *His Cause and Conduct of the World War* appeared in 12 languages besides English. In his later years Doyle was a convinced spiritualist and a lecturer and writer on spiritualism. He died on July 7, 1930.

Among his later works were *History of the British Campaign in France and Flanders* (vols. 1 to vi, 1915-30), *A New Revelation* (1918), *History of Spiritualism* (2 vols., 1926), and *My Memories and Adventures* (1924).

DOYLE, RICHARD (1824-1883), Anglo-Irish caricaturist, water colourist and illustrator, was born in London in Sept.

DRACHMANN, HOLGER HENRIK HERBOLDT (1846-1908) Danish poet and dramatist son of A. G. Drachmann, a physician of Copenhagen, whose family was of German extraction, was born in Copenhagen on Oct. 9, 1846. At various periods he travelled very extensively in England, Scotland, France, Spain and Italy, and his literary career began by his sending letters about his journeys to the Danish newspapers. After returning home, he settled for some time in the island of Bornholm painting seascapes. He then issued his earliest volume of poems, *Digte* (1872), and joined the group of young Radical writers who gathered under the banner of Georg Brandes. By this time he had enjoyed a surprising experience of life, especially among sailors, fishermen, students and artists and the issues of the Franco-German War and the French Commune had persuaded him that a new and glorious era was at hand. His volume of lyrics, *Dampende Melodier* ('Muffled Melodies,' 1875) proved that Drachmann was a poet with a real vocation, and he began to produce books in prose and verse with great rapidity. *Ungt Blod* ('Young Blood,' 1876) contained three realistic stories of contemporary life. But he returned to his true field in his magnificent *Sange udhavet, Venezia* ('Songs of the Sea, Venice,' 1877), and won the passionate admiration of his countrymen by his prose work, with interludes in verse called *Derovre fra Grænsen* ('Over the Frontier There' 1877), a series of impressions made on Drachmann by a visit to the scenes of the war with Germany. During the succeeding years he visited most of the principal countries of the world, and familiarized himself by protracted voyages with the sea and with the life of man in maritime places. In 1879 he published *Rosker og Roser* ('Tendrils and Roses'), love lyrics in which he showed a great advance in technical art. To the same period belongs *Paa Somands Tro og Love* ('On the Faith and Honour of a Sailor,' 1878), a volume of short stories in prose. About this time Drachmann broke with Brandes and the Radicals, and led a 'nationalist' or popular Conservative party in Denmark. He continued to celebrate the life of the fishermen and sailors in books, whether in prose or verse, which were the most popular of their day. *Paul og Virginie* and *Lars Kruse* (both 1879), *Østen for Sol og vesten for Maane* ('East of the Sun and West of the Moon,' 1880), *Puppe og Sommerfugl* ('Chrysalis and Butterfly,' 1882), and *Strandby Folk* (1883) were among these. In 1882 Drachmann published his fine translation, or paraphrase, of Byron's *Don Juan*. In 1885 his romantic play called *Der var en Gang* ('Once Upon a Time') had a great success on the boards of the Royal theatre, Copenhagen, and his tragedies of *Volund Smed* ('Wayland the Smith') and *Brav Karl* (1897) made him the most popular playwright of Denmark. He published in 1894 a volume of exquisitely fantastic *Melodramas* in rhymed verse, a collection which contains some of Drachmann's most perfect

of which were: (1) extension of franchise, to all who could provide themselves with a suit of armour, (2) the institution of a property qualification for office (archon to minae strategus 100 minae), (3) a council of 401 members (sc. Boule), (4) magistrates and councillors to be chosen by lot. Further, the four Solonian classes are said to be already in existence.

But the passage is now generally considered spurious on the following grounds: (1) It is ignored by every other ancient authority, except in admittedly spurious passage in Plato,¹ whereas Aristotle says of his laws 'they are laws but he added the laws to an existing constitution' (Pol. ii, 9, 9). (2) It is inconsistent with other passages in the *Constitution of Athens*. It embodies some of the most advanced features of Solon's constitution, yet according to ch. vii, Solon repealed all laws of Draco except those relating to murder. (3) Its ideas are alien to the 7th century. That the qualification of the strategus should be ten times that of the archon is reasonable in the 5th but preposterous in the 7th century. Again it is unlikely that, had a wealth qualification for citizenship been established, Solon, a democratic reformer, would have reverted to an aristocratic birth qualification. (4) The terminology of Draco's constitution is that of the 5th century, whereas the chief difficulty of Solon's laws is the obsolete 6th century phraseology. (5) Lastly, the 'Draconian constitution' (hoplite census, nobody to hold office a second time until all duly qualified persons had been entrusted, fine for nonattendance in boule), embodies the ideals of Theramenes and the moderate oligarchs, which they expressed by the phrase *ἡ ἀριστοκρατία*.

Criticism of the text supports the hypothesis that ch. iv is an interpolation. Ch. iv breaks the connection of thought between iii and v. Moreover, an interpolator has inserted phrases to remove obvious contradictions: thus (1) in ch. vii, where we are told that Solon divided the citizens into four classes the interpolator adds "according to the division formerly existing," which was necessary in view of the statement that Draco gave the franchise to the Zeugites, (2) in ch. xli, the words "the Draconian" (*ἡ τῆς Δράκωντος*) are inserted in the list of constitutions, though the subsequent figures are not accommodated to the change. Solon is also here spoken of as the founder of democracy, whereas the Draconian constitution of ch. iv contains several democratic innovations. Two further points may be added, namely, that whereas Aristotle's account mentions a money fine, Pollux quotes a law of Draco in which fines are assessed at so many oxen, secondly, that though the treatise was widely read in antiquity there is no reference to Draco's constitution except the two quoted above. In any case, whatever were Draco's laws, Solon abolished all of them (Plut., *Solon*) except those dealing with homicide.

See J. E. Sandys, *Aristotle's Constitution of Athens*, 2nd ed. (1912), G. Gilbert, *Constitutional Antiquities*, Eng. trans. (1895), and works, quoted in article CONSTITUTION OF ATHENS, Grote, *Hist. of Greece*, pp. 9-11 (1907 ed.), with references, and histories of Greece published after 1804.

DRAÇO (the Dragon), in astronomy, a constellation of the northern hemisphere. The Greeks had many fables concerning this constellation, one is that when Heracles killed the dragon guarding the Hesperian fruit, Hera transferred the creature to heaven as reward for its services. The star γ Draconis has acquired historic interest because from his observations of it James Bradley discovered the phenomenon of aberration of light (see ABBERRATION OF LIGHT). It enjoyed this distinction because it is the brightest star that passes close to the zenith of Greenwich, so that errors of observation arising from refraction are minimized.

DRACONTIUS, BLOSSIUS AEMILIUS, of Carthage (according to the early tradition, of Spanish origin), Christian poet, flourished in the latter part of the 5th century A.D. He belonged to a family of landed proprietors and practised as an advocate in his native place. After the conquest of the country by the Vandals, Dracontius was at first allowed to retain his

¹A passage (long overlooked) in Cicero, *De republica*, shows that by the 1st century B.C. the interpolation had already been made, the quotation is evidently taken from the list in ch. xli of the *Constitution*, which it reproduces.

DRAÇO (DRACON) (7th century B.C.), Athenian statesman, was archon eponymos (but see J. E. Sandys, *Const. of Athens*, p. 12, note) in 621 B.C. He codified the laws, which had previously been unwritten and administered arbitrarily by the eupatrids. The fixing of the law was a great boon to the people, although later ages regarded Draco's code, in which "for nearly all crimes there was the same penalty of death" (Plut., *Solon*), as barbarously severe. For the institution of the 51 ephebes and their relation to the Areopagus in criminal jurisdiction, see GREEK LAW.

But in 1891 appeared Aristotle's treatise on the constitution of Athens, the fourth chapter of which credits to Draco the construction of an entirely new constitution for Athens, the main features

estates but was later thrown into prison by the Vandal king. He addressed an elegiac poem to the king, asking pardon and pleading for release. It is supposed that Dracontius obtained his liberty and migrated to northern Italy. This is consistent with the discovery at Bobbio of a 15th century ms., in the Museo Borbonico at Naples, containing a number of poems by Dracontius (the *Carmina minora*). The most important of his works is the *De laudibus Dei* or *De Deo* in three books, wrongly attributed by tradition to St. Augustine. The account of the Creation, which occupies the greater part of the first book, was at an early date edited separately under the title of *Hexameron*, and it was not till 1791 that the three books were edited by Cardinal Arevalo. The apology (*Satisfactio*) consists of 158 elegiac couplets, it is supposed that the king addressed is Gunthamund (484-496). The *Carmina minora*, nearly all in hexameter verse, are school exercises and rhetorical declamations. It is also probable that Dracontius was the author of the *Orestes tragedia*, a poem of some 1,000 hexameters, which in language, metre and general treatment resembles the other works of Dracontius. His works show considerable vigour of expression and a remarkable knowledge of the Bible and of Roman classical literature.

BIBLIOGRAPHY—*De Deo* and *Satisfactio*, ed. Arevalo, reprinted in Migne's *Patrologiae cursus*, ix. *Carmina minora* ed. F. de Duhn (1873), Baehrens 1879 in *Poetae Latini Minores* vol. v, re ed. F. Vollmer 1910. On Dracontius generally, see A. Ebert, *Allgemeine Geschichte der Lit. des Mittelalters im Abendlande*, i. (1874), C. Rossberg, in *D. Carmina Minora* (1878), H. Maillart, *De Dracontio poeta lingua* (1902), E. Provina *Blossio Emilio Dracontio*, in *Memorie della Reale Accademia delle Scienze di Torino* (Turin, 1912) vol. lxx. On the *Orestis tragedia* see editions by R. Peiper (1875) and C. Giarratino (Milan, 1906), pamphlets by C. Rossberg (1880), on the authorship, 1888, materials for a commentary.

DRAFT A written order drawn on a banker or other holder of funds for the payment of money to a third person, thus a cheque (*q.v.*) is a draft. A special form of draft is a banker's draft, an instruction by one bank to another bank, or to a branch of the bank making the instruction, to pay a sum of money to the order of a certain specified person. (See also **BILL OF EXCHANGE**, in **PRACTICE**.)

The term is also used to describe an outline, plan or sketch, or a preliminary drawing up of an instrument, measure, document, etc., which, after alteration and amendment, will be embodied in a final or formal shape, an allowance made by merchants or importers to those who sell by retail, to make up a loss incurred in weighing or measuring, and a detachment or body of troops "drawn off" for a specific purpose, usually a reinforcement from the depot or reserve units to those abroad or in the field. For draft in compulsory military service, see **CONSCRIPTION**.

DRAFTED MASONRY, in architecture, masonry formed of large stones dressed or cut round the edge to a single plane, with the face between left as it came from the quarry. Many notable Roman examples exist, such as that of the Porta Maggiore, at Rome (period of the emperor Claudius, c. A.D. 50). It was also particularly common in the Near East, being found from the time of Cyrus, in the platform at Pasargadae (c. 530 B.C.), up to the time of the castles built by the crusaders. In the Renaissance drafted masonry was used occasionally for decorative purposes, as in the Rucellai palace at Florence by Michelozzi (c. 1430). When so used it is sometimes loosely termed "rustication".

DRAG. The term is applied to a harrow for breaking up clods of earth, or to an apparatus, such as a grapple, net or dredge, used for searching water for drowned bodies or other objects. As a name of a vehicle, "drag" is sometimes used as equivalent to "break," a heavy carriage without a body used for tramping horses, and also a large kind of wagonette, but is more usually applied to a privately-owned four-horse coach for four m-h-and driving. The word is also given to the "shoe" of wood or iron placed under the wheel to act as a brake, and also to the "drift" or "sea anchor," usually made of spars and sails, employed for checking the lee-way of a ship when drifting. In fox-hunting, the "drag" is the line of scent left by the fox, but more particularly the term is given to a substitute for the hunting of a fox by hounds, an artificial line of scent being laid by the dragging of a bag of amsead or other strong smelling substance which a pack will follow.

DRAGASHANI (Rumanian *Drăgășani*), a town of Rumania, near the right bank of the river Olit, and on the railway between Caracal and Ramnicu Valcea.

The vineyards on the neighbouring hills produce some of the best Walachian wines. Dragashani stands on the site of the Roman Rusdava. In 1821 the Turks routed the troops of Ypsilanti near the town.

DRAGO DOCTRINE The government of every state, declared Lord Palmerston in 1848, is entitled by diplomatic methods to take up the complaint of any of its subjects against the government of another state, and if well founded, to demand redress. It has been the policy of the British Government not to encourage its subjects to hazard their capital by investing in foreign loans, and consequently it has usually refused to interfere when foreign governments have failed to meet their obligations. Lord Palmerston, however, added that in certain circumstances the Government might be prepared to go to the length of using force. To this statement Lord Salisbury subsequently gave his assent in 1880. In 1902 Venezuela having failed to comply with the demands made by Great Britain, Germany and Italy to make good its default in respect of its external loans, was called upon by these Powers to honour its obligations. Failing to obtain satisfaction, a blockade of certain Venezuelan ports was instituted. This led to the despatch of a note from Dr. Drago, foreign minister of the Argentine Republic, to the Argentine minister at Washington declaring that the principle should be accepted that for the common safety of the South American Republics, just as the Monroe doctrine is a principle enforced by the United States for the preservation of the territorial status quo throughout the American Continent against European aggression, the collection of pecuniary claims of citizens of any country against the Government of any South American Republic should not be effected by armed force. This proposal, however, did not find general acceptance, but by the Hague Convention (1907), the contracting Powers agreed not to have recourse to armed force for the recovery of contract debts claimed from the Government of one state by the Government of another state as due to its nationals. This agreement, however, does not apply if the debtor state refuses or neglects to accept an offer of arbitration, or after accepting the offer, prevents any compromise being reached, or after an award, fails to carry it out. See Sir T. Barclay, *Problems of International Law and Diplomacy* (1907), Phillimore, *International Law*, vol. II (1854-61).

(H. H. L. B.)

"COURTESY OF H. C. ROSE
DRAGOMAN OF CAIRO
EGYPT WHO ACTS AS IN
TERPRETER AND GUIDE

DRAGOMAN, a comprehensive designation applied to anyone who acts as an intermediary between Europeans and Orientals, whether as hotel tout or travellers' guide, or as the chief dragoman of a foreign embassy whose functions may include the carrying on of important political negotiations (Ar. *terjuman*, an interpreter, cf. Heb. *targum*).

The original employment of dragomans by the Turkish government arose from its religious scruples to use the language of any peoples which had not adopted Islam, while its political relations compelled the sultan's ministers to make use of interpreters, who rapidly acquired considerable influence. The first chief dragoman of the Porte was Panayot Nikousia, who held his office from 1665 to 1673. His successor, Alexander Mavrocordato (*q.v.*), Exaportos, was charged by the Turkish government with the delicate and arduous negotiation of the treaty of Carlowitz, and succeeded in becoming the factotum of Ottoman policy. From that time until 1821 the Greeks monopolized the management of Turkey's foreign relations, and soon established the regular system whereby the chief dragoman passed on as a matter of course to the dignity of hospodar (*q.v.*) of one of the Danubian principalities.

In the same way, the foreign representatives accredited to the

former sultan of Turkey, found it necessary, in the absence of duly qualified countrymen of their own, to engage the services of natives, Greek, Armenian or Levantine, more or less thoroughly acquainted with the language, laws and administration of the country, who became the confidential go-betweens of the foreign missions and the Porte. But the disadvantages of the system soon became apparent, and as early as 1869 the French government decided on the foundation of a school for French dragomans at Constantinople, for which in later years was substituted the *École des langues orientales* in Paris, most of the great powers eventually took some similar step, England also adopting in 1877 a system, since modified, for the selection and tuition of a corps of British born dragomans.

The functions of the first dragoman are mainly political and connected with diplomatic negotiations, while the subordinate dragomans transact the less important business comprising in general all the various matters in which the interests of foreign subjects may be concerned. The high estimation in which the dragomans are held by most foreign powers is shown by the fact that they are promoted to the most important diplomatic posts. In the Russian, Austrian and German services more than one ambassador began his career as a junior dragoman, and the French chief dragoman usually attains the rank of minister plenipotentiary. The more important consulates in the provinces of Turkey are also provided with one or more dragomans, whose duties, *mutatis mutandis*, are of a similar though less important nature. In the same way banks, railway companies and financial institutions employ dragomans for facilitating their business relations with Turkish officials.

DRAGOMIROV, MICHAEL IVANOVICH (1830-1905), Russian general and military writer, was born on Nov. 8, 1830. He entered the Guards in 1849 and from 1854 to 1859 studied military science first at the Russian staff college (Nicholas Academy) and then abroad. On his return to Russia he became professor of tactics at the staff college. He played a leading part in the reorganization of the educational system of the army, and acted as instructor to several princes of the imperial family. He took part in the suppression of the Polish insurrection of 1863-64. During the Austro-Prussian War of 1866, Dragomirov was attached to the headquarters of the II Prussian army. He was present at the battles on the upper Elbe and at Königgratz, and his comments on the operations which he witnessed are of the greatest value to the student of tactics and of the war of 1866.

In the Russo-Turkish war of 1877-78 he commanded the 14th division, which led the way at the crossing of the Danube at Zimnitsa. Later, after the reverses before Plevna, he, with the tsarevich and Generals Todleben and Milutin, strenuously opposed the suggestion of the Grand Duke Nicholas that the Russian army should retreat into Rumania, and the demoralization of the greater part of the army was not permitted to spread to Dragomirov's division. He was wounded at the Shipka pass, and further disabled for active service. For 11 years thereafter General Dragomirov was chief of the Nicholas Academy. He collated and introduced into the Russian army all the best military literature of Europe, and improved the morale and technical efficiency of the Russian officer-corps, especially of the staff officer. In 1889 Dragomirov became commander in chief of the Kiev military district, and governor general of Kiev, Podolsk and Volhynia, retaining this post until 1903. He was promoted to the rank of general of infantry in 1891. During the Russo-Japanese War of 1904-05 he was consigned by the general headquarters at St. Petersburg (Leningrad), and while he was charged with General Kuropatkin in many important questions of strategy and military policy, they both recommended a repetition of the strategy of 1812, even though the total soundness of Port Arthur was involved. General Dragomirov died at Koniopol on Oct. 25, 1905.

His larger military works were mostly translated into French and German, and his occasional papers, extending over a period of nearly 50 years, appeared chiefly in the *Военный Сборник* and the *Рассказы*, his later articles in the last named paper were like the general orders he issued to his own troops, attentively studied throughout the Russian army. His critique of Tolstoy's *War and*

Peace attracted even wider attention. Dragomirov was, in formal tactics, the head of the "orthodox" school. He inculcated the "offensive at all costs," and the combination of crushing short range fire and the bayonet charge. He carried out the ideas of Suvarov to the fullest extent, and many thought that he pressed them to a theoretical extreme unattainable in practice.

DRAGON, a fabulous monster, usually conceived as a huge-winged, fire-breathing lizard or snake. The word is derived through the French and Latin from the Greek *δράκων*, connected with *δρακω* "see," and interpreted as "sharp sighted." The equivalent English word "drake" or "fire drake" is derived from Anglo-Saxon *draca*. In Greece the word *δράκων* was used originally of any large serpent, and the dragon of mythology, whatever shape it may have assumed, remains essentially a snake. For the part it has played in the myths and cults of various peoples and ages see the article *Serpent Cults*. Here it may be said, in general, that in the East, where snakes are large and deadly (Chaldaea, Assyria, Phoenicia, to a less degree in Egypt), the serpent or dragon was symbolic of the principle of evil. Thus Apophis, in the Egyptian religion, was the great serpent of the world of darkness vanquished by Ra, while in Chaldaea the goddess Tiamat, the female principle of primeval Chaos, took the form of a dragon. Thus, too, in the Hebrew sacred books the serpent or dragon is the source of death and sin, a conception which was adopted in the New Testament and so passed into Christian mythology. In Greece and Rome, on the other hand, while the oriental idea of the serpent as an evil power found an entrance and gave birth to a plentiful brood of terrors (the serpents of the Gorgons, Hydra, Chimaera and the like), the *dragones* were also at times conceived as beneficent powers—sharp-eyed dwellers in the inner parts of the earth, wise to discover its secrets and utter them in oracles, or powerful to invoke as guardian genii. Such were the sacred snakes in the temples of Aesculapius and the *sacri dracones* in that of the Bona Dea at Rome, or, as guardians, the Python at Delphi and the dragon of the Hesperides.

In general, however, the evil reputation of dragons was the stronger, and in Europe it outlived the other Christianity, of course, confused the benevolent and malevolent serpent deities of the ancient cults in a common condemnation. The very "wisdom of the serpent" made him suspect, "the devil," said St. Augustine, "is a lion and a dragon, a lion because of his rage and a dragon because of his wiles." The dragon myths of the pagan East took new shapes in the legends of the victories of St. Michael and St. George, and the kindly snakes of the "good goddess" lived on in the *immanissimus draco* whose baneful activity in a cave of the Capitol was cut short by the intervention of the saintly pope Silverster I. In this respect indeed Christian mythology agreed with that of the pagan north. The similarity of the northern and oriental snake myths seems to point to a common origin in remote antiquity. Whatever be the origin of the northern dragon, the myths, when they first appear, show him to be in all essentials the same as that of the south and east. He is a power of evil, guardian of hoards, the greedy withholder of good things from men, and the slaying of a dragon is the crowning achievement of heroes—of Siegmund, of Beowulf, of Sigurd, of Arthur, of Tristram—even of Lancelot, the *beau idéal* of mediaeval chivalry. Nor were these dragons anything but very real terrors. In the works of the older naturalists, even in the great *Historia animalium* of Conrad Gesner (d. 1564), they still figure as part of the fauna known to science.

As to their form, this varied from the beginning. The Chaldaean dragon Tiamat had four legs, a scaly body, and wings. The Egyptian Apophis was a monstrous snake, as were also, originally at least, the Greek *dracones*. The dragon of the Apocalypse (Rev. xii. 3), "the old serpent," is many headed, like the Greek Hydra. The dragon slain by Beowulf is a snake (worm), for it "buckles like a bow," but that done to death by Sigurd, though its motions are heavy and snake-like, has legs, for he wounds it "behind the shoulder." On the other hand, the dragon seen by King Arthur in his dreams is, according to Malory, winged and active, for it "swoughs" down from the sky. The belief in dragons

seems to have arisen without the slightest knowledge on the part of the ancients of the gigantic and astonishingly dragonlike extinct reptiles of past ages.

The qualities of dragons being protective and terror inspiring, and their effigies decorative, they were early used as warlike emblems. Thus, in Homer (*Iliad* vi 36 seq.) Agamemnon has on his shield, besides the Gorgon's head, a blue three-headed snake just as ages afterwards the Norse warriors painted dragons on their shields and curved dragons' heads on the prows of their ships. From the conquered Germans, too, the Romans in Trajan's time borrowed the dragon ensign which became the standard of the cohort as the eagle was that of the legion, whence, by a long descent the modern dragon. Under the later east Roman emperors the purple dragon ensign became the ceremonial standard of the emperors, under the name of the *δρακόντιον*. In England before the Conquest the dragon was chief among the royal ensigns in use. Its origin, according to the legend preserved in the *Floris historiarum* was as follows: Uther Pen dragon, father of King Arthur, had a vision of a flaming dragon in the sky, which his seers interpreted as meaning that he should come to the kingdom. When this happened, after the death of his brother Aurelius, "he ordered two golden dragons to be fashioned, like to those he had seen in the circle of the star, one of which he dedicated in the cathedral of Winchester, the other he kept by him to be carried into battle." From Uther Dragon-head, is the English called him, the Anglo-Saxon kings borrowed the ensign, their custom being, according to the *Floris*, to stand in battle between the dragon and the standard. The dragon ensign which was borne before Richard I in 1191, when on crusade, "to the terror of the heathen beyond the sea" was that of the dukes of Normandy, but even after the loss of Normandy the dragon was the battle standard of English kings, and was displayed, e.g., by Henry III in 1245 when he went to war against the Welsh. Not till the 20th century was the dragon officially restored as proper only to the British race of Uther Pendragon, by its incorporation in the armorial bearings of the prince of Wales. Thus the dragon and wyvern (i.e., a two-legged snake, M.E. *wevern*, viper) took their place as heraldic symbols (see *HERALDS*).

In the east the dragon is the national symbol of China and the badge of the imperial family, and as such plays a large part in Chinese art. Chinese and Japanese dragons, though regarded as powers of the air, are wingless. They are among the deified forces of nature of the Taoist religion, and the shrines of the dragon kings, who dwell partly in water and partly on land, are set along the banks of rivers. (See also *DRACO*.)

See J. B. Panthot, *Histoire des dragons et des escarboucles* (Lyons, 1691); C. V. Darlington and F. Saglio, *Dictionnaire des antiquités grecques et romaines* (1886, etc.), s.v. "Draco"; Pauly-Wissowa, *Realencyclopädie*, s.v. "Drakon"; Du Cange, *Glossarium*, s.v. "Draco"; *La Grande Encyclopédie*, s.v. "Dragon." See also the article *BABYLONIAN AND ASSYRIAN RELIGION* (W. A. P. L.).

The term "dragon" has no zoological meaning, but it has been applied in the Latin generic name *Draco* to a number of species of small lizards, found in the Indo-Malayan region, characterized by the possession of winglike folds of skin projecting from the sides of the body and supported by the greatly elongated ribs. These structures do not involve the legs and cannot be used as actual wings for flight, they serve merely as gliding planes which extend the distance over which the animal can leap from one to another of the trees in which it lives. The largest form is only about 10 in. in length.

Another lizard to which the name is popularly applied is the giant monitor, *Varanus komodoensis*, discovered in Komodo, one of the Netherlands Indies. It is a heavily built lizard that reaches a length of at least 10 ft., thus greatly exceeding all other living lizards, although the extinct *Varanus pringi* of Australia attained perhaps twice the length.

In military use the name was applied to the musket—ornamented with the head of a dragon—from which the dragons derive their name, and later it was applied to a mechanical tractor for drawing guns, propelled by an internal combustion engine and running on caterpillar tracks. This machine, a variant of the steam

tractor for heavy guns in use in most European armies before and during World War I, and of the wartime tank, replaced teams of horses for the traction of guns and limbers in certain British field artillery brigades. (See further *ARTILLERY*.)

DRAGONET (*Callionymus lyra*), a small marine fish of the coasts of Europe, with slender naked body and large eyes close together on top of the flatfish triangular head. The male is larger and more ornamented than the female, the body and the large dorsal fins having blue spots and bands on an orange ground. There is courtship and pairing, the male and female swimming upwards in an embrace.

DRAGONETTI, DOMENICO (1763-1846), Italian double bass player, was born in Venice on April 7, 1763, and died in London on April 16, 1846. Dragonetti was a virtuoso of the first rank, and one of the best known figures in the musical life of his day. His first appearance in London was in 1794. In London he met Landley, with whom he played regularly from that time. In 1798 he visited Haydn at Vienna, and in 1808-09, on another visit to Vienna, he met Beethoven whom he worshipped. In 1835, at the age of 82, he led the double basses in the Beethoven Festival at Bonn.

DRAGONFLY, the common name applied to insects of the order Odonata. Dragonflies are graceful, acroplanlike insects which patrol the edges of ponds and streams. In the hand they are harmless and can be recognized by the great jewelled eyes, the two pairs of similar, narrow transparent wings, the long usually slender abdomen or "tail" and the fact that the six similar legs are far forward. Many are brilliant with spots and stripes of red, blue, green or yellow on a dark ground colour.

Habits and Structure—Above that of all other insects is the design of the dragonfly attuned to life on the wing. Some (*Ephedrus* princeps) seldom alight from dawn to dusk though the group has its loafers (*Neurocordulia*, *Gynacantha*) which sleep around the clock, except for short flights at dawn and again at

dusk. Dragonflies are content and at home in the air. All have speed, acrobatic ability and that most difficult manoeuvre of all, hovering, a flight skill possessed by few insects.

The eyes, occupying over half of the head surface, give both casual monocular and range-finding binocular vision as well as vision up, down and quartering to the rear. The dragonfly's life is encompassed and guided by vision. However, it is a mosaic vision, the sum of images seen by 2,000 or more individual cameras that compose the insect's compound eye. Such an eye is acutely sensitive to moving objects. The antennae, the main organs of smell in insects, are reduced to mere bristles with probably little use. The two pairs of jaws, with crushing and needle teeth, arm him well. The six legs placed far forward on the body are directed forward in hunting where the six feet form a spiny basket below the mouth in which hapless gnats are caught.

BY COURTESY OF W. J. LUCAS

FIG. 1.—DRAGONFLY NYMPH WITH MANDIBLES EXTENDED SEIZING ITS PREY. The female lays its eggs near or below the water, and after they are hatched, the nymphs spend their lives in the water until full development.

The wings are thin tough membranes stretched on an elaborate frame of veins. It is a rich basic plan for adaptation of wing structure to the flight habits of each species. Those living in low dense vegetation (*Coenagrutidae*, *Lestidae*) and of small size (1½-in. expanse) have paddlelike wings by which they flutter across the short distances between sedges and reeds. For concealment they can fold their wings against the body. The species (*Agridae*) of narrow wooded streams, full of flight obstructions, have broad

wings with rounded tips by which the dragonfly can suddenly stop and change direction. The great rivers of the world have coursing over their unobstructed surfaces at top speed (20 to 60 m.p.h.) the giant dragonflies (Macrominae) with stiff, sharp pointed wings. Collectors procure them with bird guns and dust shot. Such can bounce out of a net before the net opening can be twisted shut. The most graceful fliers (certain tropical Libellulinae), which can twist and spiral within the confines of a swarm of gnats, have the tip of the slender abdomen broadened into a thin horizontal steering fin. Such are aerial acrobats.

FIG 2—METAMORPHOSIS FROM NYMPH TO DRAGONFLY

On leaving the water the final change takes place, the anterior portion of the dragonfly being liberated through the nymph-outlet as shown in the drawing.

The thorax, to which legs and wings are attached, houses the great wing muscles, the motor of these insectan planes. The wing muscles in other insects are short and vertical but in the dragonfly they are skewed forward in a thorax lengthened forward in some tropical species to thrice the usual length. The long muscles are an adjustment to the slow beat necessitated by long wings.

The slender abdomen of ten bamboo-like segments has at the tip in the male 2 claspers by which he seizes the head or thorax of the female when they fly tandem during mating manoeuvres.

On the second and third abdominal segments of the male is a complex copulatory organ to which he transfers sperm from the sex opening near the tip of his abdomen. While flying or resting in tandem the female loops her abdomen forward and places its tip at the male organ. No other insects have a similarly complex mating, one adapted to fast flight. The females of many species with an ovipositor place eggs in soft plant tissues, while other species without, scatter eggs during flight over the water's surface.

With such structures adapted to speedy graceful life on the wing, various fine points of streamlining occur. The large eyes round the forward end. In many species the forward three segments of the abdomen form a bulbous trailer to the large thorax, easing air eddies behind the latter. The abdomen then becomes a slender trailer. In flight the legs are pulled up under the thorax. Even the wings in section are thickened along the leading edge by a series of vein-formed ridges. The speedier species even have the usual microscopic hairs eliminated.

Classification—Dragonflies in general fall into two groups, the suborder Anisoptera and the suborder Zygoptera.

The Anisoptera are usually larger, heavier-bodied and have the hind wings broader at the base than are the fore wings. At rest the wings are extended. There are seven families. Widespread northern genera are *Gomphus*, *Aeshna*, *Libellula* and *Sympetrum*.

The Zygoptera are slender and rest with the wings folded over the body (except Lestidae and some tropical species). Fore and hind wings are similar with narrow bases. There are nine families, common northern genera are *Coenagrion*, *Ischnura*, *Enallagma* and *Agrius*. In Japan and India live two species of *Epiophlebia* of an otherwise extinct suborder, the Anisozygoptera.

Development—While the adult dragonfly is an aerial insect,

it is attached to a water environment for its food of mosquitoes and aquatic gnats. The young dragonfly is aquatic but is limited to fresh or brackish water and mud. None are truly marine. Eggs are round and laid in the water or mud, or are elongate and thrust into aquatic plants when the female is one with ovipositor (Fig. 1 shows an aeshmine nymph or young with short wing pads and its elongate under lip (labium) with apical labial jaws shot forward and grasping a worm. Figs. 2 and 3 show the lip folded up under the head.) The nymph stalks its living prey by stealth and when in range shoots the lip to grab it. The food is chewed with jaws similar to those of the adult and in many species is reground within a gizzard lined with teeth. The nymph can walk but swims by a sort of jet propulsion. Water is drawn into the large rectum and is then forcibly ejected. Descended from air-breathing land insects, the nymph has a complete tracheal or air-tube system which carries oxygen to all parts. In the water the openings to the air (spiracles) are closed, and oxygen is absorbed into the tracheal system, directly from that dissolved in water, osmosis takes place through the walls of the gills and through the walls of the rectum, which areas are supplied with microscopic tracheal branches (tracheoles). In the Anisoptera the tracheolar gills are in the rectum and are folds of the rectal walls. They are aerated by

FIG 4—METAMORPHOSIS FROM NYMPH TO DRAGONFLY

The third stage shows the whole body extricated from the nymph outlet.

water drawn through the anus into the rectum. In the Zygoptera three leaf-shaped gills occur as three tails on the apex of the abdomen. If these are lost the Zygopteran nymph can still breathe by sucking water into the rectum. The minute newly-hatched nymph eats at first large protozoa, then Entomostraca (*Cyclops*, *Daphnia*), and eventually in large species may attack and devour tadpoles and young fish. It attacks only moving prey as it is eye-minded as are the adults. After many moults (10 to 15) of the skin or exoskeleton it reaches full growth. For a week or so it sits stupid and without motion while within its body the larval organs change into those of the adult.

The long lip is shortened, the wings develop as crumpled wads within the nymphal wing pads.

Eventually the urge to light and air comes and the aquatic nymph crawls slowly up a stem into the air and sunshine. The back of the nymphal skin splits and a much crumpled dragonfly crawls out to expand in an hour or so into the winged adult. (See Figs. 2-4.) It is a critical period, since martins and other birds rear their young largely on soft emerging dragonflies. Many aeshmine nymphs emerge at night and are smartly on the wing with the birds at dawn.

Geographic Distribution—Dragonflies form a small order, 2,700 species, as against some Carabidae, Coleoptera, Diptera, Hymenoptera above 100,000 each. Carnivores form small groups. Because they are adapted to sunshine they are most abundant in the tropics, with 500 species in British India and 40 species in England. Few species spread onto two continents.

Geological History—Dragonflies appear in the Palaeozoic where fossils occur in the Carboniferous at Coventry, France, next in the Permian of Kansas. These were of the order Protodonata, many large, some 2 ft. across the wings. In the Mesozoic great size is lost and early modern forms appear of the orders, Anisozygoptera, Zygoptera and Anisoptera, found in the Bavarian slates (Jurassic). Cenozoic dragonflies early modern occur in the U.S. Green river beds (Eocene), and Miocene beds in Colorado and at Oenningen (Switzerland). In the latter appear libellulid nymphs, the most modern type.

Some of the most intensely coloured insects known are Odonata. *Chalcopteryx* (the golden-winged one), South American, has

FIG 3—METAMORPHOSIS FROM NYMPH TO DRAGONFLY

The second stage shows the tail being extricated from the nymph outlet.

wings in glittering gold, metallic violets and glistening black. The jewels of the order are in *Rhinocypha*, the species of which are scattered down the islands from India to New Guinea. These have gaudy bodies but indescribably brilliant wings that glitter with iridescent pinks, greens, blues and violets. In tropical rain forests are many species which while aquatic avoid the water.

FIG. 3.—THE PERFECT DRAGONFLY. ITS METAMORPHOSIS COMPLETE. The wings have acquired their full dimensions. The dragonfly is seen resting to dry itself, before the wings are horizontally extended.

These (*Megalagrion*) in Hawaii have nymphs that live in the mud of the forest floor. In tropical America occur the giant Zygoptera of the *Pseudostigmatinae* with bodies 3.8 in. long, though slender, and 4-7 in. across the wings, the nymphs of which live in the mud at the bases of the broad leaves of tree-born epiphytes (*Bromeliads*) of the pineapple family.

Economic Importance.—All adult dragonflies catch mosquitoes while the nymphs feed on larvae and the active pupae. The nymphs are regular food for fish and diving ducks.

BIBLIOGRAPHY.—The only large general work on Odonata is R. J. Tillyard, *The Biology of Dragon-flies* (1917). For Great Britain, see Cynthia Longfield, *Dragonflies of the British Isles* (1937); America North of Mexico, Needham, *Handbook of the Dragonflies of N. America* (1929); for British India, F. C. Fraser, *Odonata of British India, Burma and Ceylon* (3 vols., 1933-36); and for Europe, R. Timpel, *Die gefährlichen Mitteleuropas* (1922). (C. H. Ky.)

DRAGON'S BLOOD, a red-coloured resin obtained from several species of plants. *Daemonorops draco*, one of the rotang or rattan palms, which produces much of the dragon's blood of commerce, is a native of Further India and the Eastern Archipelago. The fruit is round, pointed, scaly, and the size of a large cherry, and when ripe is coated with the resinous exudation known as dragon's blood. The substance in commerce is dark red brown, nearly opaque and brittle, contains small shell-like flakes, and gives when ground a fine red powder. It is soluble in alcohol, ether and fixed and volatile oils. If heated it gives off benzoic acid. In Europe it was once valued as a medicine on account of its astringent properties, and is now used for colouring varnishes and lacquers, in China, where it is mostly consumed, it is employed to give a red tinge to writing paper. The dragon's blood of commerce is still one of the products of Socotra, and is obtained from *Dracaena cinnabari*. The dragon's blood of the Canary Islands is a resin procured from the surface of the leaves and from cracks in the trunk of *Dracaena draco*. The hardened juice of a euphorbiaceous tree, *Croton draco*, a resin resembling kino, is the dragon's blood of the Mexicans, used by them as a vulnerary and astringent.

DRAGOON, originally a mounted soldier trained to fight on foot only (See CAVALRY and INFANTRY). This mounted infantryman of the late 16th and early 17th centuries, like his comrades of the infantry who were styled "pike" and "shot," took his name from his weapon, a species of carbine or short musket called the "dragon." Dragoons were organized not in squadrons but in companies, like the foot, and their officers and non-commissioned officers bore infantry titles. The invariable tendency of the old-fashioned dragoon, who was always at a disadvantage when engaged against true cavalry, was to improve his horsemanship and armament to the cavalry standard. Thus "dragoon" came to mean medium cavalry, and this significance the word has normally retained since the early wars of Frederick the Great. The light cavalry of the British army in the 18th and early 19th centuries was for the most part called light dragoons. The phrases "to dragoon" and "dragoonade" bear witness to the mounted infantry period, this arm being the most efficient and economical form of cavalry for police work and guerrilla warfare. The "Dragoonades," properly so called, were the operations of the troops (chiefly mounted) engaged in enforcing Louis XIV's decrees against Protestants after the revocation of the edict of Nantes.

DRAGUIGNAN, the chief town of the department of the Var in S.E. France, 51 m. N.E. of Toulon, and 28½ m. N.W. of Fréjus by rail, 679 ft. above sea-level, at the southern foot of the wooded heights of Malmont, on the left bank of the Nartuby river, pop. (1946) 11,801. The buildings are mainly modern. There are manufactures of leather, soap and spirits and trade in olive oil and grapes.

DRAINAGE, HOUSE. See SANITATION OF BUILDINGS.

DRAINAGE OF LAND. Drainage is the removal of unwanted water. When done over great areas of land, necessitating large engineering works, it is called arterial drainage (see below), but when done on farms to carry the water away from the fields to the nearest discharge point it is called agricultural or land drainage. It is needed because plant roots require oxygen and, if the pore spaces of the soil are blocked with water, air cannot enter nor can the carbon dioxide escape. Agricultural crops become enfeebled and their place is apt to be taken by weeds that tolerate the conditions. Drainage does not affect the water held by the powerful forces of suction in the finer pores on which the plant depends for its water supply and which may in a clay soil amount to about 30% of the weight of the dry soil.

In designing a drainage system the first problem is to ascertain if the superfluous water comes from a spring or by seepage from higher land or upthrust from an impervious subjacent layer, if so, some intercepting system is then required. But if it comes from rain it must either be led away by a water furrow or percolate through to the subsoil. On sandy or gravelly soils this happens easily, though a way out may still have to be found if the subsoil contains an impervious layer. On clays and heavy loams percolation is much more difficult and it is these that stand most in need of drainage. The method is to cut channels (formerly called "thoroughings," meaning "through ways," hence the name "thorough drainage") into which the water can seep, and to link them with an exit into a ditch that will carry the water into the arterial system either by gravity or by aid of a pump. The ditch must be kept clean so that the water may flow away as rapidly as possible.

The siting of the channels, their depth and distance apart are largely empirical matters, but there are certain general rules. Usually the depth should not be more than about 2½ to 3 ft., and the distance between them about 30 or 40 ft., less on a heavy than on a lighter soil. They should be straight, parallel on a fairly level ground but running down the slope on sloping land, and be placed that every part of the field is served. The gradient must be uniform, and the more nearly level the ground the greater must be the care in ensuring this. These channels—the minors—run into a main, entering it if possible at a right angle though this may be impracticable on sloping land. The main leads to the exit point. On high grazing land the channels may be left open, they are then called sheep drains. But on more productive land open chan-

nels would interfere too much with agricultural operations. Unglazed clay pipes¹ are carefully laid at the bottom, the ends touching, and the channels are then filled up. The pipes on the minors are usually about 2½ or 3 in. in diameter, those on the main may be larger. The outlet to the ditch must be a solid brick or stone structure. A map of the system should be carefully prepared.

The channels can be made by a machine but the machine and the pipes are both expensive. A cheaper method available on heavy soils free from stones is to use a mole plough. This implement carries a strong steel blade at the end in which is a cylinder with a pointed end, this cuts a 2 or 3 in tunnel (mole) 15 to 25 ft below the surface into which the water can drain. The moles must be much closer together than the piped lines, about 10 or 12 ft is a suitable distance apart. They should not be too long—100 yd is a usual limit—and they should not discharge directly into the main but into a length of clay pipes. On stiff soils the moles may last 15 or 20 years, but since they can be redrawn over the same mains fairly cheaply they should not be left if they show signs of failing.

The water escapes from the soil into the drainage system by gravity through large pore spaces, cracks and other discontinuities, and the extent to which these persist determines the efficiency of the system. Good cultivation, dressings of lime and deep rooted crops all help to open up new passages and to promote stability of the soil crumbs and prevent their disintegration into fine particles which would block up the passages. Silty soils are particularly liable to this risk and are therefore the most difficult to drain, clay soils are much more stable.

The benefits of drainage are many. Cultivation becomes more effective, giving a better tilth and seed bed, germination is improved, plant growth can begin earlier in spring because the soil warms up much more quickly. The roots strike more deeply into the soil, they have a better oxygen supply—and oxygen for the plant roots is, in humid regions, as vitally important as is water in arid regions. A wider range of crops can be grown and the need for bare fallows is greatly diminished, fertilizers act much more efficiently. Grass land especially benefits from drainage because wild white clover can now be grown, greatly improving the grazing value, certain harmful parasites of the livestock are reduced and troubles like liver fluke and footrot in sheep considerably lessened. It should however be added that over considerable areas of the boulder clay in England the need for drainage arises from a dense mat of vegetation on the surface which holds up the rain water, if basic slag is applied the soil microorganisms become active and break up the mat, clover develops and its roots strike through into the underlying clay making a way for the water and so dispensing with the need for drainage.

Broadly speaking it is safe to say that drainage is one of the greatest and most vital improvements in humid countries. It has long been practised in England. Yet in the 1930s the National Farmers' union estimated that 7,000,000 ac. of farm land still needed drainage. More or less the same holds true today and after World War II we are concerned about the water problem in the United States. The Government estimates that 60 million acres need drainage. In fact, the drainage industry in America is now being organized as never before.

(L J R)

ARTERIAL DRAINAGE

The term arterial drainage embraces the whole drainage system of a catchment area, other than local field drainage systems, whereby surplus water is collected from the land and delivered finally into the sea. In lowlands such as the fens in England or the polders of Holland which have been reclaimed from marshes, the drainage system consists mainly of artificial channels. In such

reclaimed areas the land generally lies at such a low level that pumps have to be employed to lift the water into the main high-level system. In former times windmills were employed for this purpose, but with the invention of the steam engine and later the diesel engine and centrifugal pump, much more efficient and intensive drainage has been possible. Apart from lowlands, where the drainage system is mainly artificial and where it is vital to the continued existence of agricultural land, practically all agricultural land depends in some degree upon drainage to maintain its fertility.

In the Netherlands, where the arts of draining and embanking have created the very soil of the country, organized drainage authorities of one sort or another may be traced from the 11th century onward. In some provinces the administration of drainage was part of the functions of the local government authority, e.g., the count and his court or the local ecclesiastical body, in others there were organizations created exclusively for this purpose. By the 13th and 14th centuries the administration of draining and embanking enterprises was highly developed, and in some regions conducted on a broadly democratic basis. In 1954 there were in the Netherlands about 2,500 embankment and drainage bodies, of which about 500 dated back to the middle ages.

It is probable that the earliest drainage authority in England, viz the lords bailifs and jurats of Romney marsh, dating from the reign of Henry III (1232), was based on the example of the Netherlands and, in its turn, served as a model for later drainage bodies in England. The first general statute relating to commissioners of sewers ("sewer" then meaning a watercourse) was promulgated in 1427 under Henry VI, it declared that his majesty had ordained that for a period of ten years commissioners of sewers should be sent into all parts of the realm where needed. The practice of issuing such commissions became permanently established in the reign of Henry VIII under the Bill of Sewers, 1531. These commissioners were, however, temporary in character. Their powers were originally limited to a three year period, later extended to five years and subsequently to ten. The commissioners had no powers to carry out any work, but they could hold inquiries, order work to be done, assess responsibilities, appoint bailiffs to collect money, distrain for arrears, and so forth. The "laws and customs of Romney Marsh" were taken as precedents to be followed.

The act of 1531 has provided the basis of land drainage legislation up to modern times. Indeed, it is the rather obscure wording of this enactment which is held to establish the principle of obtaining benefit or avoiding danger as a basis for the liability to pay drainage rates, a principle reaffirmed, but with a wider interpretation of benefit, in the Land Drainage act, 1930. The Sewers act, 1833, and the Sewers Acts Amendment act, 1849, gave wider powers to commissioners, but under the Land Drainage act, 1861, the duties of commissioners were more clearly defined and their powers greatly extended. It was under this act that elective drainage boards were first established. Apart from the commissioners of sewers, many drainage authorities were set up under special acts, particularly in the fens in the 18th and 19th centuries, when numerous internal drainage boards were established. The Land Drainage act of 1918 enabled the ministry of agriculture and fisheries to constitute drainage boards and delegated certain powers to county councils, further powers being given to county councils under the Land Drainage act, 1926.

While the work done by internal drainage boards in fen areas established under various acts was effective enough, the natural drainage problem remained unsolved. The principle of "no benefit, no rates" resulted in limited rating areas which yielded insufficient funds to carry out the works required. The failure of the Ouse Drainage board, set up in 1920 to remedy the drainage difficulties on the Great Ouse, showed how impracticable was the limited benefit area for dealing with a large-scale problem. It was largely as a result of this that the royal commission on land drainage in England and Wales was set up in 1927. The commission's report states that "the administration of ardenal drainage is conducted by a confused tangle of Authorities established by the piecemeal legislation of 500 years, and exercising a great variety of powers and functions. There is no uniformity of

²The pipes should not be too porous. In U.S. experience concrete pipes serve equally well, but they are too costly for use in Great Britain.

Statistics—According to the enterprises each serving 500 ac. In 30 states these enterprises benefit while in the other 10 the and technical supervision and arranged financing of community drainage works. The New England states, Pennsylvania and West Virginia reported no drainage enterprises.

In 1950, out of 1,158,000,000 ac in farms in the United States, 103,000,000 ac were included in drainage enterprises. This number compared with 87,000,000 in 1940 and 84,000,000 in 1930. Drainage enterprises reported 155,000 mi of open ditches, 56,000 mi of tile drains and 8,000 mi of levees. These figures do not include the much greater length of open and closed drains provided by private landowners.

Despite the large area already improved, many millions of acres of land throughout the country still needed drainage at mid-20th century.

(M. R. L.)

DRAKE, SIR FRANCIS (c. 1545-1596), English admiral, was born near Tavistock, Devonshire, about 1545 according to most early authorities, but possibly as early as 1539 (see Corbett, vol. 1, Appendix A). His father, a yeoman and a zealous Protestant, took refuge in Kent during the reign of Queen Mary. Young Drake was educated at the expense and under the care of Sir John Hawkins, who was his kinsman, he was apprenticed on a coasting vessel, and at 18 was purser of a ship trading to Biscay. At twenty he made a voyage to Guinea, and at twenty-two he was made captain of the "Judith." He fought his ship gallantly in the Gulf of Mexico under Sir John Hawkins, and returned with him to England, having acquired great reputation, though with the loss of all the money which he had embarked in the expedition. In 1570 he obtained a regular privateering commission from Queen Elizabeth, and embarked on a cruise in the Spanish Main. He planned an attack against the Spaniards in the West Indies to indemnify himself for his former losses, and set sail in 1572, with two small ships named the "Pasha" and the "Swan." He was afterwards joined by another vessel, and with this small squadron he took and plundered the Spanish town of Nombre de Dios. He penetrated across the isthmus of Panama, and committed great havoc among the Spanish shipping. From the top of a tree on the isthmus he obtained his first view of the Pacific, and resolved "to sail an English ship in these seas." In these expeditions he was assisted by the Maroons, descendants of escaped negro slaves. Having filled his ships with plunder, he bore away for England, and arrived at Plymouth on Aug. 9, 1573.

Having fitted out three frigates at his own expense, he sailed to Ireland, and served as a volunteer, under Walter, earl of Essex. After his patron's death he returned to England, where he was well received by Queen Elizabeth. The first proposal he made to her was a voyage into the South Seas through the straits of Magellan, which no Englishman had hitherto ever attempted. The queen furnished him with means, and his own fame quickly attracted the men. The fleet with which he sailed consisted of only five small vessels, manned in all by 166 men. Starting on Dec. 13, 1577, he laid his course by the west coast of Morocco and the Cape Verde Islands. He reached the coast of Brazil on April 6, and entered the Rio de la Plata, where he parted company with two of his ships, but having met them again, and taken out their provisions, he turned them adrift. On June 9, he entered the port of St. Julian's, where he remained two months,

THE SAME MARSH AFTER BEING DRAINED BY CHANNELS

partly to lay in provisions, and partly delayed by the trial and execution of Thomas Doughty, who had plotted against him. On Aug. 21 he entered the Straits of Magellan. The passage of the straits took sixteen days, but then a storm carried the ships to the west, on Oct. 7, having made back for the mouth of the strait, Drake's ship and the two vessels under his vice-admiral Captain Wynter were separated, and the latter, missing the rendezvous, returned to England. Drake went on, and came to Mocha Island, off the coast of Chile, on Nov. 25. He thence continued his voyage along the coast of Chile and Peru, taking all opportunities of seizing Spanish ships, and attacking them on shore, till his men were satiated with plunder, and then coasted along the shores of America, as far as 48° N. lat., in an unsuccessful endeavour to discover a passage into the Atlantic. He named the country New Albion, and took possession of it in the name of Queen Elizabeth. He sailed on July 26, 1579, for the Moluccas. On Nov. 4 he got sight of those islands, and, arriving at Ternate, was extremely well received by the sultan. On Dec. 10 he made the Celebes, where his ship unfortunately struck upon a rock, but was taken off without much damage. On March 11 he arrived at Java, whence he intended to have directed his course to Malacca, but he found himself obliged to alter his purpose, and to think of returning home. On March 26, 1580, he again set sail, and on June 15 doubled the Cape of Good Hope, having then on board only 57 men and three casks of water. He passed the line on July 12 and on the 16th reached the coast of Guinea, where he watered. On Sept. 11 he made the Island of Terceira, and on Sept. 26 (?) he entered Plymouth harbour. This voyage round the world, the first accomplished by an Englishman, was thus performed in two years and about ten months.

The queen hesitated for some time whether to recognize his achievements or not, on the ground that such recognition might lead to complications with Spain, but she finally decided in his favour. She went on board his ship at Deptford and there conferred upon him the honour of knighthood. She likewise gave directions for the preservation of his ship, the "Golden Hind," that it might remain a monument of his own and his country's glory. After the lapse of a century it decayed and had to be broken up. Of the sound timber a chair was made, which was presented by Charles II. to the university of Oxford.

In 1581 Drake became mayor of Plymouth, and in 1585 he married a second time, his first wife having died in 1583. In 1585 hostilities having commenced with Spain, he again went to sea, sailing with a fleet to the West Indies, and taking the cities of Santiago (in the Cape Verde Islands), San Domingo, Cartagena and St. Augustine. In 1587 he went to Lisbon with a fleet of thirty sail, and having received intelligence of a great fleet being assembled in the bay of Cadiz, and destined to form part of the Armada, he entered the port on April 19, and there burnt upwards of 10,000 tons of shipping—a feat which he afterwards called "singeing the king of Spain's beard." In 1588, when the Spanish Armada was approaching England, Sir Francis Drake was appointed vice admiral under Lord Howard, and made prize of a very large galleon, commanded by Don Pedro de Valdez, who struck at once on learning his adversary's name.

In 1589 Drake commanded the fleet sent to restore Dom Antonio to the throne of Portugal. He defeated the fleet of the king of Spain, and then sailed for the West Indies, and on Jan. 28, 1596

the older Lives by Samuel Clarke (1671) and John Barrow, junr (1843), have been superseded by Julian Corbett's two admirable volumes on *Drake and the Tudor Navy* (1898), the best source of information on the subject, which were preceded by the same author's *Sir Francis Drake in the "English Men of Action"* series (1890). See also E. J. Payne's edition of *Voyages of the Elizabethan Seamen to America*. Thirteen original narratives from the collection.

DRAKE, NATHAN (1766-1836), English essayist and physician, son of Nathan Drake, an artist, was born at York. He was apprenticed to a doctor in York in 1779, and in 1786 proceeded to Edinburgh university, where he took his degree as M.D. in 1789. In 1790 he set up as a general practitioner at Sudbury, Suff., where he found an intimate friend in Mason Good. In 1792 he removed to Hadleigh, Suff., where he died in 1836. His most important production was *Shakespeare and His Times, Including the Biography of the Poet, Criticisms on His Genius and Writings, a New Chronology of His Plays, a Disquisition on the Object of His Sonnets, and a History of the Manners, Customs and Amusements, Superstitions, Poetry and Elegant Literature of His Age* (1817).

DRAKENSBERG or QUATHLAMBA, the highest portion of the great eastern scarp of the South African plateau. It forms the eastern boundary of Basutoland and Orange Free State.

DRAM or DRACHM, a weight approximately equal to that of the ancient Greek coin, in apothecaries' weight one-eighth of an ounce, or 60 gr. (3.888 g.), in avoirdupois weight one sixteenth of an ounce, or 27.34375 gr. (1.772 g.). For short the term is used for a fluid dram (drachm), a measure of capacity equal to one-eighth of a fluid ounce. The US *Pharmacopoeia* differs in usage from the British. The former uses apothecaries' weights, the latter the avoirdupois.

DRAMA is a transmutation of the Greek δράμα, which means a thing done, theatre is a transmutation of the Greek θέατρον, which means a seeing place. The word audience, meaning those who listen, is derived from the Latin and therefore represents a later idea of playgoing. From this use of two Greek words and one Latin a useful hint is given as to the first dramatic values. Drama begins with action and spectacle, the deed comes before the word, the dance before the dialogue, the play of body before the play of mind. The audience is subsequent to the spectators. The history of drama is largely a history of changing dramatic values. Gradually the presentation of thought becomes as important as the representation of emotion, which was the main element of theatrical origins. Nowadays a person who talks about the drama may actually be thinking of a literary form and of something that will be read and discussed but will rarely or never live up to the original meaning of its name and be "done."

Modern drama includes work in which the discussion of ideas is the whole purpose of the play. Of the play it is sometimes permissible to observe that it is just as effective in book form as when "done." Indeed, in the first decade of the 20th century the drama of the intellectuals definitely revolted so far from the idea of "four boards and a passion" that H. G. Granville-Barker could describe it in this way: "Plays grew so austere, intellectual that their performance seemed a profanation, and we saw the actors moving apologetically through their parts as if they had been told that they were rather vulgar people with no right here at all." This was a paradoxical fate to befall the men of action in "the seeing place," but those who read or listen to the political and philosophical discussions in George Bernard Shaw's "Metabolical pentateuch" *Back to Methuselah* will appreciate the point of this and realize how great is the change from the simple conception of a drama as a thing done to the later use of "the seeing place" as a schoolroom for the continued instruction and entertainment of the adult who is hungry for ideas. If we are to find a definition of drama which will cover all theatrical manifestations from the wordless ritual and mummer of primitive man to the actorless dialectic of a modern philosopher that definition will be so loose as to be almost useless. It is more profitable to ask and answer two simple questions about the thing which is done. They are: Why is it done, and how is it done?

The Laws of Aristotle.—To the query "Why?" the answers fall into two main groups. It is possible to reply from a psycho-

logical or a historical point of view. It is also possible to combine the two kinds of reply. Such a combination is made in the *Poetics* of Aristotle. Because of the classical domination over western thought which has prevailed since the Renaissance, Aristotle's *Poetics* has had an enormous influence on academic views of drama. He laid down laws of drama in general and of various types of drama in particular.

Horace presented the Aristotelian lore to Rome (whose theatre was almost entirely derivative from Greek models), and the French classicists carried on the tradition of a dramatic discipline expounded in Greek lecture rooms as a small part of Aristotle's encyclopaedic survey of all human problems. So diligent was the pursuit of the classic ideal that Aristotle's hints about observing the three unities of time, place and action are incorporated and strengthened in the great French curriculum, being expanded and expounded by Jean Chapelain, Richeieu, Corneille and N. Boileau Despreaux. A last echo of the Aristotelian authority was to be heard in the dramatic criticism of A. B. Walkley who used to complain of George Bernard Shaw that he did not keep to the familiar classical rules. The critic was twitted in turn by Shaw for his obedience to "the immortal Stagire" (see *Fanny's First Play*, introduction). During the first decades of the 20th century the revolt against classical authority in the art of the theatre was finally driven home.

Imitation in Drama.—Aristotle gave both a brief historical explanation of the rise of Greek drama from ritual choruses and a psychological interpretation of the dramatic impulse. Of the latter he said (*Poetics*, 4), "Imitation is natural to man from childhood, one of his advantages over the lower animals being this, that he is the most imitative creature in the world, and learns at first by imitation. And it is also natural for all to delight in works of imitation." That is true. Man is a natural mimic as birds and beasts have been before him, and anthropologists who examine the origin of drama and seek all manner of esthetic causes for acting are seriously mistaken if they omit to allow also for the simple impulse to dress up and play at "let's pretend." But, however much the world's first player may have enjoyed his primitive masquerade or mischievous aping of a neighbour, as soon as the fun becomes regulated in a ritual a great change occurs. We soon discover that acting has become immensely serious and is directed by prudential considerations. Possibly the first "thing done" was done for a joke, as Aristotle suggested when he cited the universal delight in works of imitation. But, undeniably, when the things done became seasonal rites, they were carried on for serious and sacred purposes. The idea of going to the play as a form of relaxation or holiday treat belongs to the civilized and not to the primitive state. It is true that as early as Roman times Terence, an adroit adapter of the Greek new comedy, complained of the rivalry of jugglers and rope walkers in the Roman entertainment market, which shows how far the secular notion of playgoing had prevailed over the primeval concept of dramatic ritual. Comedy had naturally lost its religious significance before tragedy. But the essential fact about early drama, both comic and tragic, is that, all over the world, the primitive peoples have regarded it as a utility and an obligation. It is only after civilization has firmly established itself that the atmosphere of a religious service no longer surrounds the thing muted and is replaced by the less strenuous air of an entertainment for an idle occasion. Thus the development of drama presents us with a double change. On the one hand physical action directed toward an emotional climax is no longer the supreme quality of drama, since the mind insists that the mental march may be movement of the dramatic kind, on the other hand, secularization sets in and what had been in its infancy a propitiation of gods and heroes becomes in its mellow years a popular show and source of mundane merriments and excitements. Drama did quite literally begin with song and dance and the most popular form of drama today is still mainly compact of song and dance. But the difference in purpose and temper of the old dithyramb as offered to the gods and the new musical comedy "number" as projected at the orchestra and gallery is, by its very immensity, indicative of a change that is fundamental. But by

no means is the change final, since it is continually the object of theatrical reformers to recapture the drama for the exalted social purposes toward which, in other circumstances, its child hood was directed

The Origin of Dramatic Rites—It is not necessary to discuss at this point the rival theories as to the origin of dramatic rites. These theories fall into two main groups. It is claimed by one party that the song and dance from which drama sprang were a celebration of the life force in the natural world and that the traditional dramatic conflict is a repetition or a restatement of the old battle between the New Year and the Old which was fought out with ubiquitous regularity in the folklore of races. The other party, of which Sir William Ridgway was an active and important protagonist, surveyed the primitive folk dances and mummings of the world and found the significant common factor to be a tomb ritual. The "thing done" was inspired by a wish to honour the great departed and to help him to immortality in order that he might, from his place of influence in the next world, continue to guide and protect his kinsmen and his tribesmen in this world.

There is much evidence which both parties can fruitfully exploit. For the believers in a vegetation cult there are the old mummers' plays which have survived in many counties and in which a slaying of age or winter and a resurrection of youth or spring are constant features. For the other side there appears in the witness box the constant presence of the mask which is traditionally associated with the impersonation of departed spirits. The world-wide researches of anthropology have, as Ridgway demonstrated in his collection of far-fung testimony, proved a continual connection of early mummings, dances and choruses with the sites of tombs and occasions of remembrances. One cause of drama is certainly to be found in that pursuit of immortality which has been the devouring passion of man from his first rough struggles for existence down to the ceaseless quest of civilized thought into human origins and human destiny. Acting in the first form was a species of prayer. You imitate a thing in order that the gods may take the hint and do likewise. You leap round the growing corn that the corn may also leap in a large fertility, you pour out water as a sign to the god who controls the rain, you act the hero rising from the tomb or portray his sufferings and services that he may be strengthened in his immortality and pass on some of his grace and greatness and succour to mortals here below. From such ritual an art of drama was developed, from that art an entertainment.

A Birth in Holy Places—Thus, what we must conceive, if we wish to understand the vigour and variety of drama in the light of its history, is a birth in holy places. The performer was no playboy, but a priest or servant of the priests. He was also a social worker engaged, as much as any prelate or politician, in saving the tribe. By sympathetic magic he might prevail for the common good, by his persuasive arts the sun might shine and the rain might fall in their proper seasons. Dionysus, to give the fertility god his Greek name, might leap amid the leapers and pour out his power in appropriate response to the dithyramb or vigorous incantation of his cult. Or else the rite at the tomb might save from a black oblivion the vanished leader and keep him in ghostly power to help the tribe amid its difficulties and dangers. So we pass from Dionysus, the god, to the Greek Dionysia, the festival for which the tragedian wrote, and so out on to that winding highway of secular art and amusement whose final tributaries and turnings are Broadway and Drury lane.

Along such lines as these the many replies must be made to the question "Why is there drama, why is there a thing done?" Naturally the answers will vary according to the particular circumstances of time and place. Civilizations make drama according to their needs and develop it according to their capacities. To the second question, "How?" the answers will be equally numerous and various. Drama may be purely communal or purely individual, poetical or prosaic, acted by individuals and by teams or presented through the medium of the puppet or the marionette. Here it borders on ballet, there it borrows from the library. Its literary form will be found to be conditioned by the

particular stage or platform for which it was written and the particular social object at which it was originally aimed. There are no inclusive theatrical formulas. Nor can a simple definition be found by use of the word "imitation." Many of the earliest forms of drama and some of the later are not representative in the sense that the players are trying to mimic the life they know. Instead of copying they are creating and their performance is a statement and not a simulation. It is true that some kind of imitation remains, but it is imitation tempered by traditional symbolism. The Greek actor, to take the most obvious instance, did not try to imitate a man, he attempted to present something larger than life. Accordingly he wore a mask, propped himself up on buskins, and was padded out to superhuman size. This made realistic acting, as we understand it, impossible, but created a suitable mouthpiece for the superb rhetoric of Greek tragedy and also assisted the atmosphere of religious ceremonial in which the play was produced. Similarly in the mystery plays of the middle ages the actor often wore the conventional symbol of his part as though that sufficed. The symbol announced what could not be imitated. A gilt beard, for example, was the traditional decoration of St. Peter, just as in the circus we may know the clown by his colour long before he has begun his antics. The clown is an actor, but he is not, in any close sense of the word, an imitator. He works in his own world of fancy free. The history of the theatre has contained every kind of presentation and representation from the purely fantastic and symbolic to the actualities of our modern stage on which producers will lavish infinities of care in order to get a trifling detail "correct", i.e., as closely imitative of life as possible.

Varieties of Drama—Accordingly, as our eyes range up and down the whole cycle of "things done," from the vast ritual of the resurrection play of Osiris, the god hero of Egypt, to the 20th-century comedy with its cynical chatter and realistic cocktails and cigarettes, we find it difficult indeed to lay down boundaries and to make exclusive or inclusive definitions. After the broad casting of plays had become a popular practice one could not even insist that drama must be a thing seen, and from its very beginning the silent mummery, the thing seen but not heard, has been an essential form of the theatre. But, if we rule out broadcasting, we can say that drama consists of emotions and opinions and occurrences presented in three dimensions with more or less approach to imitation by human agency. (It is true that one medium may be the marionette but that is controlled by the human hand and mind.)

There may be as much or as little music, as much or as little scene, and as much or as little mechanical aid as the circumstance offers. The acting company may be a civic community, as in a pageant, or a single individual, like a modern reciter or the first Greek *ὑποκριτής* who answered the chorus and so originated dialogue. A great amount of human ingenuity has been wasted on laying down rules for drama as though it were a small and single thing. But such lawgiving either ends in academic and abstract formulas which are belied by the history and practice of the stage or else makes classifications which are so vague as to be valueless. The much discussed "dramatic conflict" is itself a widely inclusive term since the conflict may be of the mind as well as of the body, argument is simply mental action. In short, as we come to survey the various dramas of the various nations and cultures, we can only conclude that the techniques of drama are as widely divergent as the racial tendencies and individual qualities of mankind and that to lay down lists of rules and to impose conditions is only a vanity of the academic brain, against which all the diversity of performance stands in a complete and crushing defiance. (I Br.)

GREEK DRAMA ORIGINS

Modern drama is confessedly an entertainment, its "intent is all for our delight," and it is generally a piece of free fiction with imaginary characters and an invented plot. In Greece and elsewhere, however, drama was in its origin a religious ritual, intended to secure the continued life of the community or to avert the consequences of unpurged pollution or the wrath of the dead. In Rome, for instance, in 364 B.C., *ludi scaevici* were introduced from Etruria in order to stop a plague. Even in the great works of Attic drama some traces of the old ritual remain: a severely traditional form and diction, a preoccupation with religious or ethical problems and an adherence to what was regarded as true history.

Tragedy was never free fiction, and even comedy, though it uses fictitious characters, followed certain ritual forms.

Recent research has enabled scholars to understand more clearly the real nature of the ritual which took form in tragedy and comedy.

Dionysus—It is generally recognized that Dionysus was not one of Homer's aristocratic Olympians, but an "original Thracian or Thracio-Phrygian god, whose worship stole in early times into Greece and found response among the village populations. It also seems fairly sure, on lines initiated by Kretschmer, that the name, with its variants *Dios nysos* and *Deos nysos*, means either "Son of Zeus" or, more probably, "Young Zeus." *Dios* or *Deos* being the Thracio-Phrygian equivalent of Zeus. His mother is *Zelmé* (Greek, *Semle*), which is simply Earth, the perpetual queen mother, and he himself the new god who is the rebirth of the world after the dead winter. An orchestra, or dancing ground, of Dionysus with a special *theatron*, or arrangement for spectators, was built in Athens early in the 6th century B.C. and evidently became the great centre for ritual drama, including many varieties not originally connected with Dionysus. They are all, however, absorbed by him. Drama in both its forms is produced at his festival, in his theatre, under the presidency of his priest, by performers in masks and hieratic dress who are technically known as *Διονυσίου χοροῖται*.

Drama (*δράμα*) means "a thing done" or "performed," and the drama is a performance in honour of Dionysus. One may compare the *δρῶμενα* or "things done" and the *δελμάτα*, "tableaux" or "things shown" in the mysteries at Eleusis and elsewhere (cf. C. A. Lobbeck, *Aglaophamus*, pp. 50, 688 *et seq.* [Berlin, 1820]), and even more helpfully the ecclesiastical plays of the middle ages. These were sometimes tableaux, sometimes extracts from the liturgy made dramatic and divided between performers, and sometimes they were developed into plays in the full sense, representing such subjects as the Passion or the Massacre of the Innocents. They sometimes included characters outside the Gospel, e.g., the *unguentarius* from whom Mary Magdalene buys cosmetics. Sometimes they left both the Bible and the liturgy aside and dealt with the adventures of saints,

Thus we see that the mediaeval religious plays were gradually extended both in subject and treatment far beyond the original limits, and the Greek proverb *ὁδὸς τὸν Διόνυσον* ("nothing to do with Dionysus") seems to refer to a similar extension of the field of drama. Yet it would be rash to suppose that all Attic drama dealt originally with Dionysus and thence spread to other cults. It is more likely that *dramata* existed in many rituals of the Mediterranean religion from the earliest times.

Aristotle in his account of drama remarks that man is "by nature imitative," extremely ancient *χοροί*, or dancing grounds, like those from which the drama developed, have been found in Thera, Crete, etc., they are assumed as an ordinary institution in the Homeric poems, while in the dialogue *Menos* (attributed to Plato) it is remarked that tragedy was "ancient in Athens." There is also sufficient evidence of the use of tableaux and acting in other cults besides the Dionysiac to justify this hypothesis. However, it remains certain that in classical Greek times the drama was the *sacer ludus* of Dionysus.

Tragedy and Comedy—Drama took two forms distinct and never combined, *καὶ τραγῳδία*, *hōmos* song and *tragōs*-song, respectively. The first name is transparent, a *hōmos* being a revel, and almost every extant comedy ending with a revel scene. The second is obscure, and must be considered more carefully below.

To begin with comedy, we find in it almost always a *hōmos* and associated therewith, as habitually on Greek drinking vases, a *γῆμος* (*gamos*) or union of the sexes. Of the 17 plays of Aristophanes 8 end in a *gamos*. And we may note that in three of these (*Ach.*, 1, 128 *et seq.*, *Eg.*, 1, 380 *et seq.*, *Vesp.*, 1, 342 *et seq.*) it is dragged in and not naturally deduced from the plot. That is to say, it probably comes from the underlying ritual.

Also, all through the classical period, the chorus and the performers in comedy wear artificial *phallai* (i.e., representations of the male organ of generation), usually to some extent disguised in the 5th century, except in the bird or beast choruses. This feature also is usually (except, e.g., in the *Lyssistrala*) quite irrelevant to the plot. It comes from the ritual, and the ritual is a well known fertility ritual connected with the *Emantos* or recurrent year daemon.

Aristophanes boasts more than once how he has raised the tone of comedy (*Nub.*, 537 *et seq.*, *Vesp.*, 1, 015 *et seq.*, *Pax.*, 736 *et seq.*), but amid all refinements the ritual *phallai* were still retained, in inconspicuous form, even in plays like the *Frogs* and the *Birds*. By the time of Menander they had disappeared.

Thus comedy is a perfectly intelligible performance of *hōmos* and *gamos* in the ritual of the vegetation or fertility spirit, Dionysus. It represents, we may say, the triumph and marriage of the *Emantos* daemon.

Essentials of Tragedy—If we seek for some similar constant feature in tragedy, we find generally (a) an *αἰτίον* (*aition*), i.e., the origin or cause of some rate or custom. Thus the *Prometheus* trilogy explained the festival *Prometheia*, the *Ajax* explains the ritual of the Aiantidae, the *Eumenides* explains the origin of the worship of the Eumenides at the Areopagus, the *Hippolytus* the worship of that hero by maidens, the *Iphigenia in Tauris* the curious ritual of Artemis at Brauron, the *Medea* the lamentation for Medea's children, etc. We find (b) that the *aition* is almost always a death, and the ritual to be explained a tomb worship, e.g., that of Alcestis, Hippolytus, Neoptolemus, Pelcus and Thetis (*Androm.*), Rhesus, etc. Some tragedies indeed seem to be taken more from the epic tradition than from any ritual. The *Septem* is a treatment of the old siege motive, found in very early Minoan paintings as well as in the *Iliad* and the *Thebais*, but the trilogy to which it belongs is based on the regular year-king sequence, in which the old king is killed by the young king with the queen mother as his accomplice. Some of the plays about Orestes (e.g., Sophocles' *Electra*) become epic rather than religious, but they also are rooted in the year-king ritual. And even the most definitely epic or heroic stories seem always to have in them a dirge or a sacred tomb, e.g., *Troades*, *Antigone*, *Persae*.

Thus it seems normal to tragedy to contain a dirge or a tomb ritual, and to act the *aition* of it. It is also noticeable that the

death of the hero or heroine is not enacted, but, as in the year ritual of Osiris, Adonis, Pan, etc., regularly related by a messenger

Death and Resurrection.—Thus, as comedy gives the *kósmos-gamos*, so tragedy gives the *πάθος-θῆνος* ("violent death and lamentation") of its hero or heroine

Now a marriage revel plus a slaying and lamentation is the content of the traditional pre-Christian religious drama once prevalent all over the Mediterranean world, and still not quite extinct under the name of the "mummers' play" It celebrates the birth and growth, the victorious battle and marriage, the lost battle and death and sometimes the resurrection of a hero representing the year, or the annual revivification of the world And Dionysus, the "Young Zeus," was just such a being, akin, as Sir James Frazer has shown, to Attis, Adonis and Osiris

Thus comedy gives a triumph and marriage, tragedy a defeat and death but in the death two lines of myth seem to be confused In one we have simply the overthrow of the old year-king, doomed for his *hubris* and his pollutions In the other we have the mourning for the young god, an Adonis, Osiris or Dionysus, torn in pieces at the harvest or the vintage, then sought for and at last rediscovered A complication is added by the rule that the death of Dionysus is "unspeakable" (see below) As for his birth and growth, we have these described in the *Hymn to Hermes*, the satyric *Dicéyales* and *Ichneutae* and the *parados* of the *Bacchae*, and it is possible that this was properly the content of the dithyramb At least Plato says that the dithyramb was *Διονύσου γένεσις, οἰσμοί* ("the birth of Dionysus, I imagine") (*Lysis*, 700B)

There is one further element commonly, though not always, present in the mummers' play, viz., the resurrection of the slain hero This resurrection or rejuvenescence occurs in many myths (A B Cook, *Zeus, a Study in Ancient Religion*, 3 vol., II, 210 et seq [Cambridge, 1914-40]) and is common in comedy (*Knights*, *Trigens*, *Amphitruos*, cf *Clouds*, *Wasps*, see F M Cornford, *The Origin of Attic Comedy*, pp 87-93 [London, 1914], cf also *Bacchae*, 184 et seq, *Heliad*, 786 et seq, *Andr*, 548-765) It seems possible that this was represented in the satyr play, which normally followed the third tragedy, and represented the arrival of Dionysus with his attendant *daemones* (Jane Harrison, *Themis, a Study of the Social Origins of Greek Religion*, p 344 et seq [Cambridge, 1912, rev 1927], Cook, *Zeus*, I, pp 680, 696 et seq) At any rate a trace of it seems to exist in the constantly recurring deification or heroization of the chief characters Thus it seems that in dithyramb, comedy, tragedy and satyr play we have traces of the birth and growth, the marriage, the death and the resurrection of the year-daemon, which formed the subject of a complete ancient mummers' play

The Goat Song.—We have seen above that the *tragōidia* or goat song, with its enigmatic name, describes the *πάθος* or violent death of the hero, generally by some form of ritual slaying and particularly by *sparagmos* or dismemberment When we observe that a goat was the animal commonly sacrificed to Dionysus, and particularly was so at Icaria, where tragedy is said to have been invented by Thespis, it seems reasonable to suppose that the goat song was the song sung over the sacrificial goat It is certain that in Graeco-Roman tradition generally the goat was especially associated with Dionysus, and almost certain that the dismembered kid or goat, of which we hear so often, was the representative or the embodiment of the god (L R Farnell, *The Cults of the Greek States*, v, pp 105 et seq, 302, 303 [Oxford, 1896-1909]) The *sparagmos* or *διασπαρσμός* of the kid, whose blood the worshippers sacramentally drank, tells its own tale The goat song is the song of the dismembered goat, which is really the god (Cf Eratosthenes, "The Icarians then first danced around a goat," and Farnell, *The Cults of the Greek States*, v, p 303)

When, therefore, Herodotus tells us (v, 67) that at Sicyon they used to honour Adrastus instead of Dionysus, celebrating his "sufferings" (*πάθεα*) with tragic choruses, we may naturally suppose that other people in their tragic choruses celebrated the "sufferings" of Dionysus What were these "sufferings"?

The Dismemberment.—We have the express testimony of He-

rodotus, a contemporary of the bloom of tragedy, that the characteristic worship of Dionysus was "in almost all respects the same" as that of Osiris (see Harrison, *Themis*, p 342, Hdt., II, 48 *τὴν δὲ ἑλλήνων ἀνάγουσι ὁρτὴν τῷ Διονύσῳ· οἱ Αἰγύπτῳ, πᾶσι χωρὶν, κατὰ ταυτὰ σχεδὸν πάντα ἔλλαττο*) Ordinarily Herodotus simply uses the name Dionysus for Osiris (as here, cf II, 144, "Osiris is Dionysus in Greek," cf II, 42, etc) We know the ritual of Osiris, and must therefore conclude that the ritual of Dionysus also contained a *sparagmos*, mourning, search and discovery It seems at first sight extraordinary that, if this were so, there is no mention of this ritual in classical times The explanation is given by Herodotus When there is mention of Osiris' death and lamentation he has a religious scruple against mentioning Dionysus' name in such a connection (II, 61, "They lament but whom they lament I must not say" (cf II, 132, "When the Egyptians lament the god whom I may not name in this connection," so II, 170, 86) It was forbidden to speak of the death of the god who was the life of the world Consequently, in the manner of ancient religion, a surrogate took the god's place We find a frequent *sparagmos* of beings who have committed some sin against Dionysus or other gods of Pentheus by Maenads, Orpheus by Maenads, Lycurgus by horses, Hippolytus by horses, Dirce by a bull, Actaeon by hounds, etc This use of a surrogate was made easier by the fact that both at Eleusis (Lobeck, *Aglaophamus*, pp 50, 688 et seq) and in the Osiris rite (Hdt., II, 171) the myths were sometimes conveyed by tableaux, not words The truth could be shown to the wise and at the same time veiled from the unknowing Such facts help to explain the charge of "profaning the mysteries" which was brought against Aeschylus

Aristotle's two statements, that tragedy arose "from the *ἐξάρχοντες* of the dithyramb" and comedy "from those of the *ῥηλίκαι*" are thus intelligible The dithyramb (see above) is perhaps used for the whole birth and death story of Dionysus, the *exarchontes* develop into the actors as opposed to the chorus *Τὰ φαλλικά* form that part of the year ritual which is concerned with the *gamos*, and perhaps also, as in the Osiris rite, with rebirth or resurrection

In the remains of tragedy that we possess a few plays, like the *Bacchae*, and Aeschylus' *Edon*, show the full Dionysus ritual almost unaltered, its influence is visible in others, such as the *Hippolytus* and *Andromache*, which have a sequence of scenes showing agon, pathos or *sparagmos*, messenger, threnos, theophany But elsewhere we find that other rituals have left almost equally clear traces the regular earth-and-year sequence in which the sky god marries the earth (Gaia, Semele, etc) and is overthrown by his son, the virgin martyr rite, in which a king gives his daughter or son to save the city (*Macaria*, *Iphigeneia*, *Polyxena*, *Menekleus*), the rite of supplication at an altar (the two *Supplikes* plays and frequently elsewhere), of atonement for a sin (for Medea's children, Heracles' children, for Oedipus' pollutions), of averting the wrath of the dead (*Eumenides*, many tomb rituals) One can see also great influence exerted by the idea of the theophany or resurrection

Most tragedies end with the quasi-deification of some hero or heroine, or at least the foundation of some worship Less prominent but constantly influential among these ritual types is the figure of the *pharmakos*, the old polluted year, the sin bearer, who has to be stoned or cast out, to suffer for his people Oedipus and Orestes are typical

Thus, while we must allow for the influence of epic legends and heroic sagas upon tragedy, and of mere stories upon comedy, in the main Greek drama grows from a dramatization of ritual, and mostly of some ritual connected with the cult of the year spirit or vegetation spirit When drama was put specially under the charge of Dionysus the specific Dionysus ritual, resembling that of Osiris, with its *sparagmos* and search and discovery, became prominent, but it was not exclusive, and through the earlier part of the 5th century other themes were fully as common It is the year religion in general which provides tragedy with its main scheme and exhibits life in the tragic pattern as a thing which, like the corn and flowers, like the young animals, like the sun and earth themselves, begins gentle and gracious, grows gradually,

great and commits the sin of *hubris* (pride), and at last in punishment of that sin must die and be replaced.

Development of the Modern View—The researches referred to above have, after much controversy, arrived at something like a firm and generally accepted result, which is really a restatement of the traditional doctrine better understood. That doctrine, as stated in old books like Max Müller and Sir James Donaldson's *History of Greek Literature* (1858), regarded tragedy as a performance developing from the cult of Dionysus, the god of wine, ecstasy and the forces of nature, especially the joy of the spring. It was obviously a little difficult to get from this god to tragedy, though to comedy the way was easy enough. In A. E. Haigh's *Tragic Drama of the Greeks* (Oxford, 1896) this difficulty is felt but not solved. The first bold stroke at a solution was made by Sir Wilfrid Ridgeway, who simply denied the Dionysian origin of drama, and explained tragedy as a funeral performance at the grave of a warrior ("Origin of Tragedy," in *Quarterly Review* [1908], also a book, same title [1910]). These were followed by *Dramas and Dramatic Dances of Non-European Races* [Cambridge, 1915]. Part of Ridgeway's theory was obviously true. Tragedy is a *Traversal*, a ritual lamentation over a death, and almost every tragedy contains a sacred or "heroic" tomb. On the other hand, all the ancient testimony describes tragedy as a Dionysiac celebration, and no one had properly emphasized the words of Dionysius Halicarnassensis, *Roman Antiquities*, II, 10, about "black-robed festivals, with beatings of the breast and lamentation over the disappearance (or death) of gods, as for the rape of Persephone and the sufferings of Dionysus."

Meantime the real nature of Dionysus was much clearer by Frazer's *Adonis, Attis, Osiris*, which emphasized the element of death and mourning in this type of cult, and Farnell's account of Dionysus in *The Cults of the Greek States*, vol. V. Farnell rightly (chap. 5) derived tragedy from the contest between the fair and the dark (*i. e.*, day and night or summer and winter), using a hint of H. Usener's in the *Archiv für Religionswissenschaft* (pp. 303-313 [1904]), while A. Dietrich in a remarkable article in the same *Archiv* (1908) developed the conception of tragedy as a *sacer ludus*, for the purpose of averting the disasters which it portrayed. The connection between the Dionysus cult, dithyramb, tragedy, etc., and the wide-spread year celebration known as the mimes' play, with its sequence of birth, growth, victory, marriage, defeat, death and (sometimes) resurrection, was first brought out by Richard M. Dawkins, "A Modern Carnival in Thrace and the Cult of Dionysus," in the *Journal of Hell Studies*, xvi (1906).

Gilbert Murray in a chapter contributed to Jane Harrison's book *Themis* pointed out the knowledge by Herodotus of a Dionysus cult practically identical with the mourning cult of Osiris, and the regular presence in tragedy of a ritual death, together with the traces in many tragedies of the complete sequence: agon, pathos, messenger, threnos, theophany. Finally, Cornford in *The Origin of Aitica Comedy* combined with this conception of tragedy as the death and lamentation of the year-daemon the observation that comedy represented his victory, revel and marriage. For Dionysus as Young Zeus see especially A. B. Cook (*Zeus*, II, 271-291), also the account of the marriage of the "very old wooden Dionysus" with the Baslinna in A. Mommsen's *Feste der Stadt Athen* (p. 302, *et seq.* [Leipzig, 1898]) and L. Deubner's *Attische Feste* (p. 100 *et seq.* [Berlin, 1932]). The best negative criticism of these results is by A. W. Pickard-Cambridge, *Dithyramb, Tragedy, and Comedy* (Oxford, 1927).

GREEK DRAMA HISTORY

The beginning of tragedy may be put at the foundation of the Great Dionysia by Peisistratus (535 B.C.), when Thespis was the first victor. There were already festivals, presided over chiefly by Apollo and the muses, for music and for epic recitation, the new feast gave dignity to the Dionysiac dance and spectacle and perhaps began its separation from the wild play of the satyrs. The full Dionysiac celebration was a tetralogy, consisting of three *tragic dramas* (performances) followed by a *drama* of satyrs, the *phallos* half god *daimon* forming the rout of Dionysus.

Aristotle's statement that tragedy arose from the *exarchontes*, or directors, of the dithyramb, is illustrated by the earliest tragedy we possess, Aeschylus' *Suppliants*, which has three choruses of 50 dressed with barbaric splendour and each directed by its *exarchon* the Danaiads by their father, the Argive soldiers by their king, the Egyptians by the herald. The dancing, 603 lines out of 1,073, must have occupied fully three-quarters of the time, and the subject is simply the flight of suppliant virgins from black pursuers. There is no separate *troupeur*, or actor, unconnected with the chorus. Tradition, however, says that Thespis employed one actor and Aeschylus two. The satyr element faded away later, as in Euripides' proto-*Alcestis*, but of the two elder contemporaries who competed with tragedies against Aeschylus in 499 B.C., Choerilus is famed as "a king among satyrs" and Pratinas as "second only to Aeschylus" in the satyr play.

Phrynichus (first "victory" 511 B.C., another 476, with Themistocles as *choragus*) invented dance movements "as many as waves on a stormy sea" and wrote lyrics beloved by Aristophanes long after him. Many of his plays started a tradition in tragedy, *e.g.*, *Alcestis* (cf. Euripides), *Suppliants*, followed by *Aegypius* (cf. Aeschylus) and *Phoemissae* (celebrating the victory of Salamis, like Aeschylus' *Persae*). His *Capture of Miletus*, however, celebrating a disaster with political bearings, incurred a fine and was never imitated.

In early times each tragic drama probably concentrated on one situation, so that the three made up a loosely connected story, like some of the recorded trilogies of Aeschylus. His *Orestes*, however, the one trilogy we possess, was written toward the end of his life and is a magnificent unity. The element of epic story as opposed to Bacchic dance steadily increased. Aeschylus drew "slices from the great banquet of Homer" (not the *Iliad* and *Odyssey*, which belonged to the Panathenaea, but the rest of the epic tradition), and Sophocles was named "Ὀμηροποιός," "most Homeric" (In the *Odyssey* only 317 lines out of 1,530 are lyrical.) Sophocles particularly developed the "plot," *i. e.*, the art of telling a story not by narrative but by action. He dropped the tetralogy and made each play a finished whole. The third actor, introduced by him, led the way to complex dramatic effects as when a messenger brings the news of Orestes' death at the same time to Clytemnestra and Electra, throwing one into exultation, the other into despair, while the news itself is a lie. No such effect could be produced with the two actors of Aeschylus, whose genius liked to concentrate on one great situation, like the age-long martyrdom of Prometheus, or one problem, like the crime that can only be avenged by more crime (*Orestes*). Sophocles made his diction more natural, his character drawing more subtle and varied and his verse more fluent, often ending a line with no pause, and sometimes even with an elision. One may say he created the "well made play" admired by Aristotle.

Greek opinion, however, demanded, as may be seen from the *Frogs* and from Plato, that a poet should be σοφός, "wise" or "enlightened," and Euripides particularly responded to the demand. In some ways he returned toward Aeschylus in his Dionysiac form (see above), his grand choral effects, his religious problems, even his revival of the obsolete long-trochaic metre, but in thought he belongs to the Sophistic age, being a friend of Anaxagoras and Protagoras and particularly admired by Socrates. He subjects to criticism both the traditions about the gods and the Socratic theory that virtue is knowledge (Hipp., 377-383). He was also an adept in *πρῶτον*, not what we call "rhetoric" but the new "art of speech," aiming at order and lucidity. His plays generally start with a prologue, often spoken by a supernatural being, explaining the subject, and end with a divine judgment or prophecy. This produces both a ritual form and an artistic pattern: calm—passion and crisis—calm. The variety of his themes is remarkable, he has dramas of love (*Hippolytus*, *Medea*), of mystery (*Bacchae*) and realism (*Electra*), of adventure (*Telephus*, *Helena*), of epic fullness (*Phoemissae*) and of static Aeschylean tragedy (*Troades*).

He had only 5 victories, 1 of them after his death, as against 13 of Aeschylus and 18 of Sophocles. The ancient life says,

strangely, that he "had no ambition about the theatre" In later antiquity, however, he was far more acted and read than the other two Aeschylus, though always respected, began to be obsolete even in the 4th century B.C., he is little noticed by Aristotle Sophocles was not apparently much acted, and was less quoted and discussed than Euripides, though far more highly praised by the critics He was something of a critic himself, remarking that Aeschylus "did what was right without knowing how," while Euripides presented people "as they are, not as they ought to be presented"

The three great writers towered above the rest, but others, like Ion and Agathon, were admired, and Philocles actually defeated the *Oedipus Rex* of Sophocles The plays of the three were reproduced by their heirs, who also wrote tragedies of their own Euphorion, son of Aeschylus, Iophon, son of Sophocles, and Euripides, nephew of his namesake Later on, because of the conquests of Alexander, the interest in tragedy spread all over the Hellenistic world, but the art of Dionysus chiefly lived on in the so-called new comedy (see below)

Old Comedy—For its general nature see above Popular revels and *phallics* were no doubt common and took the most varied forms what is remarkable is their development in Athens into a brilliant art form, spirited and accomplished in language and verse, and often highly intellectual in subject One may compare the history of the "mime," or humorous realistic conversation piece, which branched into philosophical discussions under Euripides and reached the very height of philosophy in Plato's dialogues The old comedy had a fairly fixed traditional form: a prologue and preparation scene, an agon or contest, ending in a victory (cf. the mummer's play), a break in the action for the parabasis or "coming forward" of the chorus to address the spectators on behalf of the poet, and finally a number of more or less farcical scenes, showing the result of the victory, e.g., what happens when Dicaeopolis has made a private peace all by himself, or when the birds have founded their happy city

We know the old comedy only by 11 plays of Aristophanes, though other writers, such as Cratinus, Eupolis, Crates, Pherecrates and Magnes, are known by a few criticisms in Aristophanes (especially *Knights*, 1,516-40) and by about 1,500 fragments The subjects discussed are public and topical, whether political (*Acharnians*, *Knights*, *Lyssistrata*), philosophical (*Clouds*) or literary (*Frogs*, *Thesmophoriaeuzae*), and seem to be addressed to a very well read audience As remains of the popular fertility revel we may note the frequently indecent language, the constant suggestion in the background of a better world to be attained in some new age, and the personal abuse of politicians, as in the cartoons in modern newspapers These attacks were often violent, especially against the ultrademocratic war party, and were forbidden by law (414 B.C. and later) when that party was chiefly in power In the general distress after 404 B.C. the old chorus, consisting of true Athenian citizens "taught" by the poet, seems to have been replaced by professional performers of higher training if less pure citizenship In the latest extant plays of Aristophanes we find occasionally, instead of the actual lyric, the note "chorus," as is regular in the Menander papyrus Indeed his last plays, except for some burlesques of tragedy, form a transition or middle stage leading toward the famous "new comedy" of Menander, Philemon, Diphilus and others

New Comedy—It was a comedy of manners, with no coarse language and no mixture of the supernatural or heroic "O Menander and life, which of you imitated the other?" asks one ancient critic On the other hand it kept faithfully the Dionysiac new-year pattern There is always a lost or mysterious baby who in the end is "recognized" and restored to his proper state in life He is a replica of the unknown son of a god and an earth mother, who in so many tragedies is "recognized" and becomes the "new king" (cf. Menander's *Arbitration* with Euripides' *Alope*) Menander (c. 343/2-291/0 B.C.) was known only by numerous quotations (including St. Paul's "evil communications corrupt good manners") and Terence's Latin imitations until the discovery in 1905 of a papyrus containing a great part of three plays and fragments of four others The plays fully confirm the ancient

praises of Menander's quietly witty style and delicate character drawing The plays might well belong to the times of Congreve or Molière, except that the intrigue is never produced by marital infidelity but always by the exposure or loss of a child

ROMAN DRAMA

Early Dramatists—The art of the drama was at Rome a *res peregrina*, and, according to Livy (vii, 2), took its rise from the performances of the Etruscan *hdu* who were summoned to Rome in 364 B.C. to avert by their dancing and playing the wrath of the gods who had sent a plague Livy is, no doubt, following the accepted antiquarian view of contemporary scholars, such as Varro, and too much reliance must not be placed upon his details, but that Roman drama came under Etruscan influence at an early stage is proved by the Etruscan origin of the words *hister* (player) and (probably) *persona* (a player's mask) Rome had been in contact with the Italian Greeks much earlier than the middle of the 4th century and must have been aware through them of the existence of dramatic exhibitions, and the "Fescennine verses" were germs out of which the art of dramatic representation might have been developed Further, the Oscan town of Atella from an early time had possessed (possibly under Greek influence) a rude native drama, afterward developed at Rome into a distinctive form under the name of the *fabula Atellana* Under the combined influence of the Etruscan *hdu* and the rudimentary of the Fescennine verses there developed (according to Livy) a form of drama called the *satura*, with full musical accompaniment by a flute and an appropriate style of acting, but the details of the development are obscure and the very existence of the dramatic *satura* is doubtful

It was not till the Punic Wars that Rome possessed a regular drama Livius Andronicus, a Greek captured at Tarentum and afterward a schoolmaster at Rome, translated a Greek tragedy and comedy for production at the Roman games of 240 B.C. The titles of nine tragedies and three comedies of his survive, the skill with which Greek metres are handled in his extant fragments, and the success with which the Latin language is adapted to their use, are so remarkable as to cause hesitation in accepting the current view that he was absolutely the pioneer of verse translation from the Greek His contemporary Gnaeus Naevius inclined more toward comedy than tragedy, we have the titles of 34 comedies of his as against 7 tragedies he was the first to choose as subjects for tragedies traditional Roman legends (e.g., Romulus) or contemporary events such as the battle of Clastidium (222 B.C.), this type of tragedy was known as *fabula praetextata* The fragments of his comedies contain references to contemporary life and manners worked into the framework of his Greek original One of his most famous comedies was the *Tarentilla*, which turned upon the adventures of two young men detected by their fathers living with two girls in Tarentum and haled back to respectability Naevius thus pointed the way for the later type of comedy which found its subject matter in Roman (or Italian) life, the *fabula togata* The work of the two pioneers was continued by Quintus Ennius who was born in Calabria in 239 and lived till 170 B.C. We know by name only two comedies of his, but there are fragments of 22 tragedies, and two *fabulae praetextatae* He seems to have been especially attracted by Euripides, his translation of the *Medea* was famous and his *Andromache in Captivity* was well known and appreciated as late as the time of Cicero

Plautus and Terence—After Ennius no one attempted both branches of the drama, indeed the practice had already been abandoned by his elder contemporary T. Maccius Plautus, a na-

tive of Sarsina in Umbria whose dramatic career began during the later years of the Second Punic War. Plautus confined himself to comedy, and is the great representative of the *fabula palliata*, the comedy imitated or adapted from the Greek masters of the middle or new comedy, Menander, Philemon, Diphilus and then Terence. Of the poet himself we know next to nothing, the only certain dates in his career are those of his death (194 B.C.) and of the production of the *Stichus* (200 B.C.) and the *Pseudolus* (191 B.C.). The name Plautus may be a nick-name ('flatfoot') and Mucius may be derived from the name of one of the stock characters in the *fabula Atellan* in which he may have appeared during his youth. The details of his life given by later writers are either inventions or inferences or modelled upon fables in Greek biographies. The 6 complete comedies which we possess along with the *Trinummus* (extant only in fragments) were all that Varro recognized as genuine of the 150 attributed to Plautus in his day (hence known as the *fabulae Varronianae*). Besides these we have insignificant fragments of 25 of the plays rejected by Varro. Of the prologues to the extant plays some are certainly (and all may be) post-Plautine.

Though Plautus immoderately adopted a Greek original he preserved his independence, fitting in upon occasion scenes from other plays where they served his purpose (a method known to subsequent critics as *contaminatio*). He introduced quite freely allusions to Roman legal procedure, manners and customs; he abandoned the previous convention with regard to the metres of dialogue; his boisterous humour broke through the artistic restraint imposed by tradition upon his Greek masters. One of the greatest masters of the Latin language Plautus roasts and gambols in dialogues in which everything is sacrificed to the desire to raise a laugh, but the merriment and uprightness of his diction are extraordinary. His high spirits and his mastery of dialogue remained unique in Roman comedy.

Plautus' younger contemporary, Titus Cincius who died in 168 (or 166) B.C., with his comic later critics regarded as the chief of Roman comedians. Masters of plot and *gratuitas* were regarded as his principal merits, following the advice of his friend Ennius he avoided *contaminatio*. His chief model was Menander to whom he owed the plots of 16 of his 42 known comedies and his fragments show that (in spite of Cicero's *maius latinis latius auctor est*) he had caught something of Menander's happy brevity. A new movement which roused the hostility of the dominant school of comedy was represented by Publius Terentius Afer who, coming to Rome from Carthage as a slave, became a literary friend of Scipio and his circle and died at an early age c. 159 B.C. Of Terence's six plays the first (the *Indra*) was produced in 166 B.C. and the last (the *Idylls*) in 100 B.C. Terence avoided the boisterous mirth of his predecessors and lacks the rich vocabulary of Plautus; he excelled in the portrayal of character, his style is choice and correct without formality, he avoids the anachronisms and carelessness of Plautus, and simplifies his medium by confining himself practically to two metres and by omitting the lyrical passages in irregular verse known as *canina*. His prologues were war upon the popular taste and the views of his critics. Without the strength and vigour of Plautus, Terence is superior to him in dramatic construction and definiteness of phrase, and became the acknowledged model of cultivated Latin speech. After Terence the comedy modelled upon Greek originals declined, and a number of writers (Sextus Turpilius, who died in 103 B.C.) alone deserve mention. He represents the extreme reaction from the line of correctness of Terence to the vocabulary of the crowd. But the public taste was turning to other forms of comedy, though *palliatae* continued to be produced and earlier plays were revived and imitated. It is to this period that many of the plays afterward attributed to Plautus can be assigned, including (perhaps) the *Asinaria*.

Later Developments.—Roman tragedy after Ennius was continued by his nephew and pupil Marcus Pacuvius, born at Brundisium about the beginning of the Second Punic War. He was regarded down to the time of Quintilian as the chief Roman tragedian, though Cicero finds fault with his style. We possess fragments of one *prae-tectata* and 13 tragedies modelled on the Greek.

His plays continued to be performed till the 1st century A.D., the most famous being the *Tenace*, the *Intopia* and the *Niptra* parts of which Cicero preferred to Sophocles' play on the same subject. Pacuvius' metre conformed closely to Greek models, and he was noted for his copious flowing style and his love for compounds and unusual grammatical forms. His technical competence was contrasted by later critics with the spirited and lofty genius of Lucius Accius (born 170 B.C.), whom Ovian seems to have rated higher than Pacuvius. Fragments survive of 43 of his tragedies and of two *praetextatae*. His plays cover the whole of Greek mythology and his favourite master is Sophocles. His first tragedy the *Atrius*, was produced in 139 and though Pacuvius to whom it was read found it somewhat harsh and immature in spite of its stately and sonorous style, it remained a favourite acting piece. His style shows the influence of theonic and he provided models for more than one of Seneca's plays. Quintilian considered him a master of diction.

By the last century B.C. the comedy borrowed from Greece was supplanted by the *fabula togata*, the subject of which was the life of country towns and obscure people. Its chief writers were the plebeian Titinius, a younger contemporary of Terence. I. Quintus Atta (d. 77 B.C.) and Lucius Afranius (b. about 150 B.C.). The last brought the *togatata* to the highest finish and his plays were popular till the Augustan age. Sulla's predilection for the *fabula Atellan* gave it a vogue during the same century. These forces originally dealt with stock characters (Maccus the simpleton, Pappus the old fellow, Dossennus the hunchback, etc.) but later were assimilated to the *fabula togata*. The same century witnessed the rise of the *minimus* which by the time of Cicero had ousted the *Atellan* as an *exodium*. The principal writers of these, generally licentious, plays were Decimus Laberius (105-143) and his contemporary Publius Syrus, a liberated slave from Antioch, the fame of the latter rests mainly on the collections dating from the 2nd century A.D. of *sententiae*, or pithy sayings from his works.

During this century the tragedies of the earlier masters were frequently reproduced but there was no tragedian of repute until the reign of Nero when Seneca composed his tragedies whether for the theatre or not is uncertain. He borrowed freely from his predecessors, Greek and Latin, and produced nine tragedies, in which plot and character were subordinated to declamation and expositions of Stoic morality, but as models of tragic composition they long exercised great influence. The *praetextata* entitled *Octavia* which is included in the list of his plays is of later date.

Production of Plays.—The early Roman drama laboured under great restrictions: plays were produced only at the great festivals, such as the *ludi Romani*, the *Megalensia*, etc., or at funerals, triumphs and dedications of temples. The theatre was a temporary structure of wood and for long no seats were permitted. An attempt in 151 B.C. to build a stone theatre was prevented by the consul Scipio Aemilianus. Pompey's stone theatre was not built till 55 B.C. though wooden seats for the spectators had been provided a century before.

There were three stock changes of scene, and the only music was provided by a flute player (*tibicen*). At first authors acted in their own plays but later a manager (such as Ambivius Turpio, who produced for Terence) with a troupe of actors (*grex*) brought out the play, engaging their services to the magistrate who had charge of the festival. These actors were generally slaves, though the Atellan farces were for long produced by freeborn citizens, in course of time, however, great actors like Quintus Roscius Gellius and Clodius Aesopus had a certain social position, though the actor in a name (*plamper*) was despised until imperial times.

DOWNFALL OF THE CLASSICAL DRAMA

The end of the ancient classical drama has been already fore shadowed. The elements of dance and song, never integrally united with the dialogue in Roman tragedy, were now altogether separated from it. While it became customary simply to recite tragedies to the small audiences who continued (or, as a matter of courtesy, affected) to appreciate them the *pantomimus* commended itself to the heterogeneous multitudes of the Roman theatre and to an effete upper class by confining the performance of the actor to gesticulation and dancing, a chorus singing the accompanying text. The species was developed with extraordinary success under Augustus by Pylades and Bathyllus, and so popular were these entertainments that even eminent poets, such as Lucius (40-39-65), wrote the librettos for these *fabulae saturnae* (ballets), of which the subjects were generally mythological, only now and then historical, and chiefly of an amorous kind.

Comedy more easily lost itself in the cognate form of the *mimus*, which survived all other kinds of comic entertainments because of its more rudacious immorality and open obscenity. Women took part in these performances by means of which, as late as the 6th century, a *mima* acquired a celebrity which ultimately raised her to the imperial throne, and perhaps occasioned the removal of a disability which would have rendered her marriage with Iustinian impossible.

Meanwhile, the regular drama had lingered on, enjoying in all its forms imperial patronage in the days of the literary revival under Hadrian (117-138), but the perennial taste for the spectacles of the amphitheatre, which was as strong at Byzantium as it was at Rome, and which reached its climax in the days of Constantine the Great (c. 288-337), under whom the reaction set in, determined the downfall of the dramatic art. It was not also totally extinguished even by the irruptions of the northern barbarians, but a bitter adversary had by this time risen into power. The whole authority of the Christian church had, without usually caring to distinguish between the nobler and the looser elements in the drama, involved all its manifestations in a consistent condemnation (as in Tertullian's *De spectaculis*), comprehended them all in an uncompromising anathema. When the faith of that church was acknowledged as the religion of the Roman empire, the doom of the theatre was sealed.

At Rome the last mention of *spectacula* as still in existence seems to date from the sway of the Ostrogoths, in the earlier half of the 6th century. In the capital and provinces of the eastern empire the decline and fall of the stage cannot be similarly traced, but its end is authoritatively assigned to the period of Saracen invasions which began with the Omeyyad dynasty in the 7th century. Gradually, however, as they lost all footing in the centres of civic life, the mimes and their fellows became a wandering fraternity, who doubtless appeared at festivals when their services were required, and vanished again into the depths of the obscurity which has ever covered the strollers' life. It was thus that these strange intermediaries of civilization carried down such traditions as survived of the acting drama of pagan antiquity into the succeeding ages.

CHINESE DRAMA

Chinese drama is deeply rooted in the tradition of the country and has many conventions which are not easily understood by the casual spectator. Even to this day when films and plays in plain dialogue compete so hard with the traditional drama, which is something of an opera, there is no sign that the latter has lost any of its popularity. It has colour in the gorgeous pre-17th-century costumes and it has well-trained actors to perform dancing, singing and mime, allowing just enough variation to give the imprint of the favourite actor's individuality, which reinterprets old themes and familiar songs and dances and livens up the conventions of the stage. In the miming and dancing, quick or slow, the movements of hands, feet, head or body are always in curves

and never in angles or straight lines, as, for instance, in Javanese dancing.

Sources.—The history of the traditional drama of China, like that of most dramas, goes back to the earliest rituals connected with sacrifices performed with song and dance by the *wu* (priests and their acolytes), and a very ancient pantomime is said to have originated from a symbolical dance in honour of the victory of Wu Wang, founder of the Chou dynasty, over the then known empire of China. Dancing and singing always accompanied celebrations at harvests and in connection with war and peace.

But the drama proper did not develop directly from religious ceremonies as, say, in Greece. Miming, dancing and singing continued to exist as such and Hsuan Tsung of Tang (8th century A.D.) personally trained actors in music and dancing in the part of his palace called Pear garden. His patronage is cherished in the memory of this much despised profession to this day, so that actors still call themselves "disciples of the Pear garden."¹ Meanwhile, independently, there grew up at court the tradition of persons offering counsel to their ruler under the cover of impersonation, to present a story or a situation which led to the remembrance and this method often softened the blow so much that the ruler tolerated it, was often amused and could even see his own faults of omission or commission in a more reasonable light. Thus such persons were in the position of the clowns in Shakespearean plays. The rulers of Tang and Sung employed groups of actors to perform little one-act plays at court banquets besides the performance of dance, music and song, and it was greatly amusing when these actors satirized, chiefly with puns, on the most powerful ministers as well as the emperor and his lords, even at the risk of losing their heads. Wang Kuo wei in his *History of the Drama of Sung and Yuan* recorded many such plays or dialogues.

Side by side with such impersonation and dialogues between two or more actors there grew up in Tang times a rich body of short stories, *ch'uan-ch'ie*, historical, heroic, melodramatic or tragic, which became very popular, and from them professional storytellers could extract material for their own embellished interpretations to their special audiences in their various dialects. Competing with these in popularity were performances of Buddhist sutras and stories, *pien-wen*, which look more like a direct ancestor of the drama. These were originally stories from sutras woven in order to interpret to the laymen the ideas of Buddhist saints and sages. Large audiences flocked to the monasteries to hear the storyteller of the *pien wen*. These stories consisted of short prose passages, either direct quotations from a sutra or parts of a Buddhist story in prose, each is followed by a rhymed part to be chanted or sung and this embellishes the short and comparatively dry prose with something appealing to the audience, since it furnishes personal and familiar details, depicts characters, provides humour and diversion and in some cases good poetry. The singer of these *pien wen* must have employed facial expressions, his hands and change of voice to add vividness and poignancy to his story, but it was still told in the third person. Like religious drama in the west, this sort of entertainment became so popular that vulgarities crept in and caused embarrassment to the monasteries as well as to the Confucian government. The Sung emperor Chen Tsung (988-1022) issued an edict to forbid its performance, so that it disappeared from the sacred places, but its prototype with increasingly secular themes reappeared among the people in different areas by another name. In the *pien wen* narrative, song and mime were combined for the first time.

Meanwhile music and dance had experienced a great change in Tang times, as this period came after long foreign domination in the northern part of the empire and the great emperors of Tang times extended their influence to western Asia and continued the contact with the outside world. Exchange of cultures was bound to take place and in the sphere of music and dance foreign influence was so dominant that of the ten schools of music only two taught the native kind. Chinese poems were fitted to popular tunes, of either native or foreign origin, and these poems and tunes were seized upon by singers to be the medium for telling their stories.

Drama Proper—At the times of Sung and Chin (K'itan Tatars, 1115-1234) long acts of dancing and singing with a chorus incorporating popular tunes and representing some narrative were called *yuan-pên* or *isa chu*, but it was only in *Yuan times* (1280-1367) that the drama proper, again called *isa chu* or *pei ch'u*, actually appeared. It included singing of the poetic parts which were the popular tunes (*chu kung-tiao*), dialogues, mime and dancing when it could fit in, and for the first time the actor spoke in the first person. These dramas or operas or plays, whatever one chooses to call them, were in four acts with occasionally a *tsieh tsu* (wedge) taking the place of a prologue or epilogue, according to its position. They were necessarily short plays, seeing that at a banquet or celebration a play was only one feature of a variety of entertainment. When a longer story was told, it had to be done in more plays than one. A story like that of *Hsi-Hsiang-Chi* (The Western Chamber) took up the time of five plays of four acts each. The peculiar feature of these plays was that only one person did the singing throughout one play, and so hero and heroine never sang together. Later during the Ming dynasty in the 16th century the *K'un-ch'u* or music from the Wu district became the most popular and plays of this style abolished the earlier restrictions of the four-act rule as well as that of allowing only one person to sing throughout the play. The play probably then became independent as a complete entertainment with more than one singer and was able to be as long as its theme required, without the previous time limit. The construction of the play became freer after Yuan times.

The themes of Chinese plays range from historical plays about emperors, princes, ministers, popular strategists and successful generals down to the common men, melodramas and mysteries expanded on themes of the short stories (*ch'uan-ch'i*) of the T'ang dynasty and stories from other sources of past and present, woven around persons of all classes and walks of life, depicting vividly the virtues and vices of nearly every phase of society. From the Yuan dynasty to this day the Chuang Yuan (candidate who has been awarded a first) has always been the favourite hero who wins the fair, as through examinations even the poorest and most despised could be raised to the highest rank and salary and thus become the flower of Chinese society. The state examination and the grand reviser of court decisions often take the part of *deus ex machina* in discovering the guilty and rewarding the virtuous. With the exception of *The Western Chamber* in which the hero and heroine follow the dictates of love rather than those of Confucian morality, most plays uphold virtues such as filial piety and the wife's devotion to her husband, as in *P'i-P'a Chs* (*The Story of the Lute*), loyalty and self sacrifice as in *Chao-Shih-Ku-Erh* (*The Little Orphan of the House of Chao*), the theme taken by Voltaire in his *L'Orphelin de la Chine*, chastity, fortitude, honesty and so on. The Chinese audience abhorred an unjust ending, so much so that often spirits were brought back onto the stage to be witness against the wicked. As the Chinese stage is bare, with colour depending on the gorgeous costumes and headgear of the actors, and properties are few, often of symbolical character, there is no difficulty at all in allowing ghosts or immortals to stalk among the human beings—characterized as they will be by what they wear and carry.

The traditional plays of China cannot be classified strictly as tragedies and comedies, for they usually include both comic and tragic events. Where a character has suffered at the hands of evil people or through fate, the suffering does not seem to call forth nobility and magnanimity from him, for the story will rather pile misfortune upon misfortune on the poor creature who suffers like a dumb animal. The three unities were never recognized by Chinese playwrights, and the audience was accustomed to follow the story through years and over hundreds of miles.

From the Yuan dynasty down to the present the traditional theatre has appealed to all classes of Chinese society, who participate in the joy and sorrow of the characters on the stage and follow intently the music of the orchestra and every word sung by the chief actors as well as the actors' movements, with all the nuances and variations which they will introduce in spite of the stylized conventions.

At the end of the Manchu dynasty and after the Chinese Revolu-

tion of 1911, experiments were made with plays without music, called *wen ming hsi*. They could not compete with the traditional plays in popularity as they failed to transport the audience into that "suspension of disbelief" which the miming and singing and conventions, main attractions for the audience of the older play, were able to create. There was a surge of dramatic activity in propaganda plays during the Japanese invasion of China beginning in 1937, an example is *The Lone Battalion*, depicting the desperate struggle of a few last men in a Shanghai godown, and modern plays have been written about social problems, as, for instance, *Slaughter*, which dramatizes the moneylender's exploitation of the farmer, and there are also translations and adaptations of favourite Russian stories and Shakespearean plays as well as more modern ones.

JAPANESE DRAMA

Traditional Japanese drama forms are *nô*, *jôruri* and *kabuki*. The *nô* derives partly from religious dances at Japanese shrines and partly from entertainments imported from China, it was given substantially its final form by Kan-ami Kiyotsugu and his son Se amu Motokiyo (1363-1443) at Nara. Since the 16th century its language, costumes and settings have not changed, its audiences are mainly connoisseurs and it is deeply involved in Zen mysticism. The stage is square, with the audience on three sides. Toward the back, projecting obliquely from the left, is an open passage (*hashigakari*) leading from the dressing rooms. Along this the actors (who are all male) make their entrances. The acting is stately and formal, the scenery nonexistent or merely symbolic, the costumes magnificent. The principal actor generally wears a mask or succession of masks corresponding to a development of character. Concentration and a feeling of identity with the role enacted are considered essential for a *nô* actor. Facial expression being impossible, it is partly replaced by conventional manipulation of the fan (tears, for example, being indicated by a fluttering movement of the fan alternately over each eye). Emotion is also expressed by rhythmical stamping of the feet, the stage being resonant. An orchestra of three drums and a flute, and dances by the actors, serve to intensify the drama. A chorus comments on the action and, when the chief actor dances, chants his part. The language is a combination of verse and prose, with many allusions to earlier literature. Subjects are drawn mainly from Japanese history and legend, but also include Chinese stories and Indian and native Buddhist themes. A *nô* program consists of several plays, with comic interludes (*kyôgen*).

Jôruri is puppet drama. It enjoyed great popularity between 1650 and 1730, but is now restricted to the Bunraku theatre in Osaka, where scenes from famous plays are performed. This drama, which carries puppet manipulation to a higher level of complicated skill than anywhere else in the world, arose about 1600 from the collaboration of puppeteers attached to temples and shrines (where they performed scenes from Buddhist or Shinto legend), with performers who chanted to the accompaniment of the *shamisen* (a three-stringed instrument then recently introduced into Japan). The puppets, about three feet high, are manipulated each by as many as three men. Movement even of tongue, finger joints, and eyelids is possible. Scenery is of great complexity, the revolving stage having been introduced early in the 18th century. The possibilities of the puppet theatre had been quickly recognized in Yedo (now Tokyo), where Satsuma Jôun (d. 1666) produced many plays on the life of Kimpri, a legendary general, in these the use of puppets permitted gruesome scenes of bloodshed. *Jôruri* would not have been very important, however, had not Chikamatsu Monzaemon (1653-1724), Japan's greatest dramatist, worked with the reciter Talemoto Gidayû (1651-1714) in Osaka. He transformed the violent plays of

Yedo into highly complicated and fantastic pseudohistorical dramas, the most famous being the *Battles of Coxinga*. Chikamatsu also initiated the *sewamono*, the plots of which were drawn from contemporary incidents, they were usually stories of illicit love, often ending in a suicide pact, as in the *Love Suicide at Sonezaki* and *Courier from Hades*. Other important *jōruri* dramatists are Ki no Kaion (1663-1742) and Takeda Izumo (1691-1756).

After 1750 *jōruri* declined and was replaced in popular favour by *kabuki*, which is played by live actors. It also originated about 1600, with performances in Kyoto by a female dancer, O Kuni. *Kabuki* developed into normal drama, at first using only woman actors, governmental bans upon woman and then boy actors hampered its development until Ichikawa Danjūrō, in Yedo, about 1680, presented *kabuki*, now using only adult male actors, with vivid scenes of violence, bizarre make up and exaggerated gestures. *Kabuki* appropriated the entire *jōruri* repertory, and borrowed heavily from the *no*, no outstanding original dramatist having emerged. Its stage has complicated scenery, and a gangway (*hanamichi*), along which protracted exits and entrances are possible, stretches from it to the back of the auditorium. *Kabuki* remains widely popular, its acting style reveals much puppet influence. Since 1868 modern western style plays have appeared, apart from translations, there are many good original pieces, such as *Father Returns* by Kikuchi Kan and *The Priest and His Disciples* by Kurata Momozō.

INDIAN DRAMA

The earliest texts of the Indian classical drama, which consist of fragments of three plays dating from the 2nd century A.D., reveal certain characteristic features which were destined to remain in the drama throughout the period of its greatest brilliance and subsequent decline. Much speculation has arisen, therefore, as to the probable sources of the dramatic form. Native tradition affords a purely mythical explanation on this point. Modern scholarship has put forward various theories, attempting, on the one hand, to derive the origins of the drama from certain of the Vedic hymns which were cast in dialogue form, on the analogy of known developments in ancient Greece, and, on the other, to place the sources of the drama in the recitation, accompanied by gesture, of epic tales. That religious subjects were favoured for such representation is suggested by a reference in the *Mahābhāṣya* (*The Great Commentary*) of Patañjali (2nd-3rd century B.C.) to two dramatic themes dealing with episodes of the Kṛṣṇa (Krishna) cult, while the fact that Sauraseni, the language of the drama, is a dialect of the Sanskrit spoken in the region of the Ganges, is a further indication of its religious origin. The drama, in fact, is a form of religious literature (*śāstra*) to instruct the sage Bhārata in his creation, goes at least give prominence to the essential elements of the Sanskrit theatre, with its conventional gestures, alternation of prose and verse, and subordination of plot and character to emotional content.

The Classical Drama—The first drama of known authorship, which appears among the 2nd-century fragments mentioned above, is the *Sūtrputra-prakarana* of the Buddhist author Asvaghosa (1st century A.D.), dealing with the theme of conversion to Buddhism found also in his two poetic works. Enough of the text remains to show that the division into acts, the use of both

prose and verse, and the appearance of a Prākṛit-speaking *Vidūṣaka* were features already well established in Asvaghosa's time. One of the other two fragmentary plays, depicting a religious allegory, represents a type of composition which was to culminate in the 11th century *Prabodhacandrodaya* (*The Rise of the Moon of Knowledge*).

Such are the first records of the drama, and between Asvaghosa and Kālidāsa no accurately datable work is known. The 13 plays published at Trivandrum in 1912 were at one time attributed to Bhāsa, whom Kālidāsa mentions as a predecessor, but much has been said against this view. Three of the plays, however, *Śaṅkavāsavadattā* (*The Vision of Vāsavadattā*), *Pratītyāyagandharayana* (*Yagandharayana's Vows*) and *Cārudatta*, are most probably, because of their literary qualities, to be ascribed to Bhāsa. The plot of the first two is taken up later in *Ratnāvalī* (*The Pearl Necklace*), while the third foreshadows *Mrcchakatika* (*The Little Clay Cart*). However uncertain the date and authorship of the Trivandrum plays may be, there is general agreement as to the position of the next writer who appears in Indian literary history. Most scholars have placed Kālidāsa's date at approximately A.D. 400, and it is probable that he enjoyed the favour of the Gupta kings at their court in Ujjain. The supreme figure in Sanskrit letters, Kālidāsa is the author, among other works, of three dramas, one of which, *Abhijñānasakuntalā*, was known in Europe in 1789 (in English translation) and earned unstinted praise from Goethe, who possibly imitated its form in the opening scenes of *Faust*. The play describes the love of King Duśyanta for the fair Sakuntalā, and the plot, a favourite one in Sanskrit drama, revolves around their first meeting, subsequent separation and final recognition and reunion. Similar is the theme of *Vikramorvāṣī* (*Vikrama and Urvāṣī*), which tells of the love of the mortal king Purūravas for the divine nymph Urvāṣī, a tale as old as the Vedas, though it has lost some of its former effectiveness because of the demands of the courtly drama. The third play, *Mālavikāgnimitra* (*Malavikā and Agnimitra*) is of unequal merit.

Harsha, a 7th century king of northern India, is assured an important place among Sanskrit dramatists for his *Ratnāvalī*, where the ever-popular triangle problem is posed and solved in Indian fashion. King Udayana falls in love with a maiden of unknown descent, Sagarikā, and causes great distress thereby to his queen Vāsavadattā. After many misunderstandings and jealous protests, the difficulties are resolved by Vāsavadattā's final acceptance of Sagarikā, who turns out to be a princess, as a co-wife. Of the other two plays of Harsha, the *Priyadarśikā* is a more feeble treatment of the same theme, while the *Nāganandī* (*The Joy of the World of Serpents*) describes a young lover's self sacrifice for religious reasons, the ultimate reward of which is reunion with his beloved.

Bhāvabhūti (8th century), whose dramas are generally considered to rival those of Kālidāsa, is nevertheless of more serious temperament. The story of Rāma and Sītā, involving marriage, separation and reunion, which he dramatized in *Mahāvīracarita* (*The Fortunes of the Great Hero*) and its sequel, *Uttararāma-carita* (*The Later Fortunes of Rāma*), hailed by many as his greatest play, depicts a passion deeper and more enduring than the love affairs which form Kālidāsa's material. Bhāvabhūti's third play, *Mālatīmādhava* (*Malati and Madhava*), follows the adventures of a young couple in overcoming the difficulties placed in the way of their marriage. It is interesting in that it contains a subplot involving a second pair of lovers, but because of the looseness of its construction and its excessive length the play fails to be dramatically effective.

The *Venṣambhāra* (*The Binding of the Tress of Hair*) of Bhāta Nārāyaṇa, whose date cannot be later than A.D. 800, derives its material, in somewhat prolix and disjointed fashion, from the *Mahābhārata*. The same fault is visible in the *Bālārāmāyana* (*The Lesser Rāmāyana*) and the incomplete *Blabharāta* (*The Lesser Bhārata*) of Rājasekhara, but Rājasekhara wins an enduring place with his *Karṇāyana* (*The Compeller Cluster*), a play entirely in Prākṛit, which takes up, once again, the *Ratnāvalī* theme.

Drama Proper—At the times of Sung and Chin (Khitai Tartars, 1115–1234) long acts of dancing and singing with a chorus in incorporating popular tunes and representing some narrative were called *yuan pên* or *tsa chu*, but it was only in *Yuan times* (1280–1367) that the drama proper, again called *tsa-chu* or *pei ch'u*, actually appeared. It included singing of the poetic parts which were the popular tunes (*chu kung-hao*), dialogues, mime and dancing when it could fit in, and for the first time the actor spoke in the first person. These dramas or operas or plays, whatever one chooses to call them, were in four acts with occasionally a *hsieh-tzu* (wedge) taking the place of a prologue or epilogue, according to its position. They were necessarily short plays, seeing that at a banquet or celebration a play was only one feature of a variety of entertainment. When a longer story was told, it had to be done in more plays than one. A story like that of *Hsi Hsueh Chi* (The Western Chamber) took up the time of five plays of four acts each. The peculiar feature of these plays was that only one person did the singing throughout one play, and so hero and heroine never sang together. Later during the Ming dynasty in the 16th century the *k'iu ch'u* or music from the Wu district became the most popular and plays of this style abolished the earlier restrictions of the four act rule as well as that of allowing only one person to sing throughout the play. The play probably then became independent as a complete entertainment with more than one singer and was able to be as long as its theme required, without the previous time limit. The construction of the play became freer after Yuan times.

The themes of Chinese plays range from historical plays about emperors, princes, ministers, popular strategists and successful generals down to the common men, melodramas and mysteries expanded on themes of the short stories (*ch'uan-chi's*) of the T'ang dynasty and stories from other sources of past and present, woven around persons of all classes and walks of life, depicting vividly the virtues and vices of nearly every phase of society. From the Yuan dynasty to this day the Chuang Yuan (candidate who has been awarded a first) has always been the favourite hero who wins the fair, as through examinations even the poorest and most despised could be raised to the highest rank and salary and thus become the flower of Chinese society. The state examination and the grand reviser of court decisions often take the part of *dus ex machina* in discovering the guilty and rewarding the virtuous. With the exception of *The Western Chamber* in which the hero and heroine follow the dictates of love rather than those of Confucian morality, most plays uphold virtues such as filial piety and the wife's devotion to her husband, as in *P'ei P'ei-chu* (*The Story of the Lute*), loyalty and self sacrifice as in *Chao Shih Ku-erh* (*The Little Orphan of the House of Chao*, the theme taken by Voltaire in his *L'Orphelin de la Chine*), chastity, fortitude, honesty and so on. The Chinese audience abhorred an unjust ending, so much so that often spirits were brought back onto the stage to be witness against the wicked. As the Chinese stage is bare, with colour depending on the gorgeous costumes and headgear of the actors, and properties are few, often of symbolical character, there is no difficulty at all in allowing ghosts or immortals to stalk among the human beings—characterized as they will be by what they wear and carry.

The traditional plays of China cannot be classified strictly as tragedies and comedies, for they usually include both comic and tragic events. Where a character has suffered at the hands of evil people or through fate, the suffering does not seem to call forth nobility and magnanimity from him, for the story will rather pile misfortune upon misfortune on the poor creature, who suffers like a dumb animal. The three unities were never recognized by Chinese playwrights, and the audience was accustomed to follow the story through years and over hundreds of miles.

From the Yuan dynasty down to the present the traditional theatre has appealed to all classes of Chinese society, who participate in the joy and sorrow of the characters on the stage and follow intently the music of the orchestra and every word sung by the chief actors as well as the actors' movements, with all the nuances and variations which they will introduce in spite of the stylized conventions.

At the end of the Manchu dynasty and after the Chinese Revolu-

tion of 1911, experiments were made with plays without music, called *wen ming hsi*. They could not compete with the traditional plays in popularity as they failed to transport the audience into that "suspension of disbelief" which the miming and singing and conventions, main attractions for the audience of the older play, were able to create. There was a surge of dramatic activity in propaganda plays during the Japanese invasion of China beginning in 1937, an example is *The Lone Battalion*, depicting the desperate struggle of a few last men in a Shanghai godown, and modern plays have been written about social problems, as, for instance, *Slaughter*, which dramatizes the moneylender's exploitation of the farmer, and there are also translations and adaptations of favourite Russian stories and Shakespearean plays as well as modern ones.

JAPANESE DRAMA

Traditional Japanese drama forms are *nô*, *jôruri* and *kabuki*. The *nô* derives partly from religious dances at Japanese shrines and partly from entertainments imported from China, it was given substantially its final form by Kan ami Kiyotsugu and his son Se ami Motokiyo (1363–1443) at Nara. Since the 16th century its language, costumes and settings have not changed, its audiences are mainly connoisseurs and it is deeply involved in Zen mysticism. The stage is square, with the audience on three sides. Toward the back, projecting obliquely from the left, is an open passage (*hashigakuri*) leading from the dressing rooms. Along this the actors (who are all male) make their entrances. The acting is stately and formal, the scenery nonexistent or merely symbolic, the costumes magnificent. The principal actor generally wears a mask or succession of masks corresponding to a development of character. Concentration and a feeling of identity with the role enacted are considered essential for a *nô* actor. Facial expression being impossible, it is partly replaced by conventional manipulation of the fan (*teus*, for example, being indicated by a fluttering movement of the fan alternately over each eye). Emotion is also expressed by rhythmical stamping of the feet, the stage being resonant. An orchestra of three drums and a flute, and dances by the actors, serve to intensify the drama. A chorus comments on the action and, when the chief actor dances, chants his part. The language is a combination of verse and prose, with many allusions to earlier literature. Subjects are drawn mainly from Japanese history and legend, but also include Chinese stories and Indian and native Buddhist themes. A *nô* program consists of several plays, with comic interludes (*kyôgen*).

Jôruri is puppet drama. It enjoyed great popularity between 1650 and 1730, but is now restricted to the Bunraku theatre in Osaka, where scenes from famous plays are performed. This drama, which carries puppet manipulation to a higher level of complicated skill than anywhere else in the world, arose about 1600 from the collaboration of puppeteers attached to temples and shrines (where they performed scenes from Buddhist or Shinto legend), with performers who chanted to the accompaniment of the *shamisen* (a three stringed instrument then recently introduced into Japan). The puppets, about three feet high, are manipulated each by as many as three men. Movement even of tongue, finger joints, and eyelids is possible. Scenery is of great complexity, the revolving stage having been introduced early in the 18th century. The possibilities of the puppet theatre had been quickly recognized in Yedo (now Tokyo), where Satsuma Jûn (d. 1669) produced many plays on the life of Kimpira, a legendary general, in these the use of puppets permitted gruesome scenes of bloodshed. *Jôruri* would not have been very important, however, had not Chikamatsu Monzaemon (1653–1724), Japan's greatest dramatist, worked with the rector Takemoto Gidayû (1651–1714) in Osaka. He transformed the violent plays of

Particularly interesting because of their treatment are the *Mrechakatika* of Śāṅkha and the *Mudrarakṣasa* (*Rakṣasa* and the *Saṅgi*) of Viśākhadatta. The first is centred in bourgeois life and relates the courtship and marriage of a noble Brahman, Cāruḍatta, with a courtesan, Vāsuntikā, and the second abounds in the traditional love interest, forming a well-knit drama of political intrigue, with Cāṇakya, the Mithavelli of Indian tales, as the prominent character.

A different but at one time popular type of drama is the *bhāna*. Only one character appears, the *Vīta*, who carries on imaginary conversations about his adventures among the less reputable quarters of the big cities. Four such plays were discovered and published in 1927 under the general title *Āṭarbhāṇa*.

Finally, there is the late but important *Prabodhacandrodāya* of Kṛṣṇamāra (11th century). A philosophical allegory with abstract qualities as the characters, it portrays with much skill the strife of good and evil forces in man's mind.

After the 11th century and the Moslem invasions the Sanskrit drama suffered a decline, and most of the productions of the following centuries are inferior to those of the great age. The forms remained, but the inspiration was lacking, the romantic drama never again reached its former heights, Kṛṣṇamāra, like Calderón de la Barca, had no worthy successors, while plays like the *bhāna* and the *prahasana* (farce) degenerated into mere crudities. The new theatre of India was destined to arise out of the modern dialects.

Species of Drama.—The Sanskrit drama, no less than Sanskrit poetry, has been subjected to the traditional Hindu criticism, a purely analytic process carried out with a regard for minutiae and fine distinctions unknown to other literatures. Bharata's *Nāṭyaśāstra*, a large compendium of criticism on all the arts and the first authoritative work to survive, lays down the criteria for determining the main types of drama. These pedantic rules are further developed and elaborated in later works dealing exclusively with the theatre, notable among which are the *Daśarūpa* (*The Ten Forms [of Drama]*) (10th century) and the later *Sāhityadarpaṇa* (*The Mirror of Poetry*), new divisions being added and general rules frequently being inferred from single instances.

Dramas are termed, in a general manner, *rūpaka*, of which ten species are recorded, the division resting on the content, type of hero and sentiment (*rasa*) to be evoked. Secondary types, termed *uparūpaka*, also came to be classified, and of these 15 to 18 species are mentioned. The highest form of *rūpaka* is the *nāṭaka*, where the subject is legendary, the hero a royal or divine personage and the sentiment heroic or erotic (*Abhijñānashakuntalā*, *Mahāvīra-carita*). Another form, the *prakaraṇa*, is similar in theme, but the main characters are drawn from ordinary society (*Mrechakatika*, *Mālatīmādhava*). Among the *uparūpaka* may be mentioned the *bhāna* and, on a still lower scale, the *prahasana* or farce.

What is remarkable to the western mind in this classification is not merely the elaborate nature of the criteria, but the very basis of the criticism. The division into tragedy, tragicomedy and comedy which has developed in the west is irrelevant in the case of Sanskrit drama. The tragic denouement of a play was expressly prohibited, and whatever the sufferings of the characters during the course of the play, a happy ending was considered essential, even if it involved the introduction of *deus ex machina*. Again, whereas in western drama importance is placed on a plot worked out through psychological conflict, the chief aim of the Sanskrit theatre was to evoke a sentiment or *rasa*, of which more than eight types have been classified. For this reason the Hindu play approximates more closely to the dramatic poem of western literature. Apart from the basic types of *uparūpaka*, which did not conform to the main rules of the drama, the Hindu theatre was designed to satisfy the tastes of an intellectual aristocracy, its very life was bound up with the interests of a cultured Sanskrit-speaking minority.

Structure.—The Indian play begins generally with a benediction (*mantra*) which is followed by a prologue (*prastāvanā*) where the stage manager (*sutradhara*) explains the situation with a view or more of the end to introduce the subject matter of the play.

The play itself is divided into acts (*anaka*), which vary considerably in number from play to play. Characteristic is the use of both prose and lyrical verse in Sanskrit drama, while the appearance of Prakṛit, or dialect, beside Sanskrit, the latter spoken by the hero and the chief male characters, is a noteworthy feature. The heroines and, in general, all the female characters speak Prakṛit, usually Sauraseni, while Mahārāṣṭri is used for the songs. Prakṛit is also spoken by the *Vidūṣaka*, a Brahman who is represented as the hero's friend. He is an important character in the play and bears a certain resemblance to the fool of the Elizabethan stage. His attempts to further the hero's love intrigues are usually mis-placed, and his remarks are designed purely to raise laughter.

Scenery was not used, since, although types of stage were described in the dramatic treatises, plays were generally performed at royal courts or in the open air. Change of scene, which was freely permitted, was therefore indicated in the text. Duration of action, the unity of which was enjoined but, unfortunately, not always followed in practice, was usually limited to one year, while the length of an act was not to be more than 24 hours. Death and violence were prohibited on the stage and practices such as kissing and eating were not approved.

Summary.—The Indian drama moves and has its being in an idealistic atmosphere and treats its problems with an acute perception of the workings of human passion. Love and heroism are its most popular themes, and these are portrayed within the range of a clearly defined and complete philosophy, which allows, nevertheless, for the intervention of fate or divine decree. Nature is the storehouse whence the Indian poet draws his wealth of imagery, and it is in lyrical scenes, such as the meeting of Duryānta and Śakuntalā, that the Indian drama makes its particular appeal to the western reader. Despite the restrictions imposed on it by its limited audience, and despite the fact that it is built up not only on an alien system of philosophy but on an outlook and a standard of comparisons drawn from a vastly different environment, the Hindu theatre nevertheless will amply reward him who gives it his attention, for it is worthy to rank high among the dramas of the world.

PERSIAN DRAMA

Persian literature, until late in the 19th century, exhibits no true dramatic form, either borrowed or of its own invention, which would allow of comparison with the Greek tragedies or the great dramas of western Europe. In virtually all other fields of literature—the epic and the lyric in particular, but also the narrative, the memoir, the essay and the fantasy—some comparison could be drawn, though the canons applying on either side are utterly at variance in most cases, but the dramatic, in Persia as indeed throughout most of the Islamic world, seems to have struck no clear responsive chord in the creative mind. That the Arabo-Persian civilization of the 8th-10th centuries should have worked every vein of Greek treasure but the dramatic is, however, considerably less of an enigma, for, in the Byzantine Hellenic world with which that civilization was in such fruitful contact, though science and philosophy still flourished abundantly, the tradition of Greek drama was long dead.

There is nevertheless, in the Persian character a powerful historic instinct to which all travellers from the time of Herodotus onward, have borne both direct and indirect witness, and this has tended, for centuries past, to find its expression in the religious 'mysticisms' (*tahrikah*, 'mourning or condolences') and the 'epic comedies' (*tavāshih*, 'spectacle' or *taqāh*, 'mimicry').

The former is commonly ascribed to be in its present form at any rate little older than the 11th-18th century, but it is still to be seen as considerably more venerable antecedents than this. It probably received its powerful impulse after the planting

tion of Shi'ite Islam with Persian nationalism, an ancient, often blighted hope which became a successful official policy under the Safawi dynasty (16th-17th centuries). Such plays, forming part of the *Muharram* (holy month) religious celebrations, tell of the "martyrdom" of Al Husayn, the younger son of Ali and retrospective focal point of Shi'ite aspiration—how, in his final struggle at Karbala in 680, he fought against pitiless odds, both natural and human, until with a tiny band of faithful followers he eventually succumbed to the forces of the "accursed Yazid." Though lacking the essentially dramatic development of the Christian Passion narratives, the tale is told and played with such lyrical intensity and such epic force as to spare none of the feelings of the devout audience, many of whom, indeed, often discard their semiprecious robe for one of active participation drawing their own blood with knives and chain scowles and chanting hypnotic refrains until, not seldom, oblivion supervenes. Under Riza Shah Pahlavi such spectacles were forbidden as degrading to Persian honour in the eyes of the modern world, but after his abdication in 1941 they were revived with considerable success as (ironically enough) a triumphant affirmation of Persian national pride in all its politico-religious fervour.

The "knockabout" comedy bears easy comparison with the *commedia dell'arte* and the Punch and Judy show equally in regards themes, techniques and players (many of whom are of gypsy stock). Literary allusions to it would seem to carry it back in one form or another for nearly a millennium, but it is almost certainly, of its simple yet stereotyped nature, much older than that. Despite increasingly unfavourable conditions it is still to be found, particularly in the provinces.

The modern Persian drama, though attempting more and more to use native material, is (like its Arabic counterpart) an almost wholly foreign importation, indeed, it would scarcely be unfair to suggest that it is composed for the most part of translations and free adaptations, particularly from the French. The comedy of manners has found the widest popularity, probably as representing an easily assimilated extension of the native farce, transplanted into the plebeian playhouses (*imashakhanah*) that accommodated its predecessor, it gives every promise of thriving. The more serious type of "problem play" is seldom performed, and an attempt to introduce the opera failed.

MEDIAEVAL DRAMA

In the midst of the condemnation with which the Christian church visited the stage, we find such works as the *Xpistos pástxwv* (*Passion of Christ*), formerly attributed to St. Gregory Nazianzen, and the *Querolus*, long fathered upon Plautus himself, which were doubtless mostly written for educational purposes. The same was probably the design of the famous "comedies" of Hroswitha, the 10th-century Benedictine nun of Gandersheim, in Eastphalian Saxony. While avowedly imitated in form from the comedies of Terence, these religious exercises derive their themes—martyrdoms (*Gallicanus*, part II, *Sapientia*) and miraculous or otherwise startling conversions (*Gallicanus*, part I, *Callimachus*, *Abraham*, *Paphnutius*)—from the legends of Christian saints. Thus, from perhaps the 9th to the 12th centuries, Germany and France and, through the latter, England, became acquainted with the literary monastic drama. Thus the *Play of St. Katharine* was acted at Dunstable about the year 1110 in "copies" by the scholars of Geoffrey, the Norman, afterward abbot of St. Albans, and was certainly not regarded as a novelty.

From about the 6th to the 11th century the Latin and the Teutonic elements of mediaeval "minstrelsy" more or less imperceptibly coalesced. The traditions of the disestablished *munus* combined with the "occupation" of the Teutonic scop, who is found under this name or that of the "gleeman" in Anglo-Saxon literature, before it fell under the control of the Christian church

How far these jugglers kept alive the usage of entertainments more essentially dramatic than the minor varieties of their performances, we cannot say. In different countries these entertainments suited themselves to different tastes and to different literary tendencies. The literature of the troubadours of Provence which communicated itself to Spain and Italy, came into only isolated contact with the beginnings of the religious drama, in northern France the jongleurs, as the jugglers were now called, were confounded with the *trouvères* (*q.v.*). As appointed servants of particular households they were there and afterward in England, called *menestrels* (from *ministerium*) or *minstrels*. In England such accomplished minstrels enjoyed the favour of the Norman, Angevin and Plantagenet kings. But there, as elsewhere, the humbler members of the craft spent their lives in strolling from castle to convent, from village green to city street, exhibiting their skill as dancers, tumblers and jugglers proper and as masquers and conductors of bears and other dumb contributions to popular wonder and merriment.

Pagan Elements—From the days of Gregory the Great, the western church tolerated and even attracted to its own festivals popular customs which were in truth relics of heathen ritual. Such were the Mithraic feast of Dec. 25, or the egg of Eostre tide, and a multitude of Celtic or Teutonic agricultural ceremonies of a semidramatic nature—such as processions of beasts or men in beast mask, dressing trees with flowers and the like, but above all, ceremonial dances often in disguise. The sword dance, recorded by Tacitus, of which an important feature was the symbolic threat of death to a victim, endured (though it is rarely mentioned) till the latter middle ages by which time it had attracted to itself a variety of additional features and of characters familiar as page-eggers, mummers and morris dancers (probably of distinct origin).

The dramatic "expulsion of death," or winter, by the destruction of a lay figure—common through western Europe about the 8th century—seems connected with a more elaborate rite, in which a disguised performer (who perhaps originally represented summer) was slain and afterward revived (the *Pangest*, jack in the green or Green Knight). This representation after acquiring a comic complexion, was annexed by the character dancers, who about the 15th century took to adding still livelier incidents from songs treating of popular heroes, such as St. George and Robin Hood, which latter found a place in the festivities of May day with their central figure, the May queen. The feast of fools (or asses), which enjoyed the greatest popularity in France (though protests against it are on record from the 11th century till the 17th) was well known from London to Constantinople. It was probably derived from the ancient Kalend feasts. In the 16th century the feast of fools was combined with the elaborate festivities of the 12 Christmas feast days—the season when throughout the previous two centuries the "mummers" especially flourished, who in their disguises and *usurpes* began as dancers gestulating in dumb show, but ultimately developed into actors proper.

Christian Elements—Thus the literary and the professional element, as well as that of popular festive usages, had survived to swell the main stream of the early Christian drama, which had its direct source in the liturgy of the church itself. The service of the mass contains in itself dramatic elements, and at a very early period—certainly already in the 5th century—it was used on special occasions to illustrate the Gospel narrative by living pictures accompanied by songs. The insertion, before or after sung portions of the service, of tropes, originally one or more verses of texts, usually serving as intonations and in connection with the Gospel of the day, and recited by the two halves of the choir, led to dialogue chanting, and this was frequently accompanied by illustrative action, such as drawing down the veil from before the altar.

This practice of interpolations in the offices of the church, which is attested by texts from the 9th century onward (the so-called "Winchester tropes" belong to the 10th and 11th), progressed till the liturgical mystery—the earliest form of the Christian drama—was gradually called into existence. As early as the

10th century on great ecclesiastical festivals the priests performed in the churches these offices (as they were called). The whole Easter story, from the burial to Emmus was thus presented, the Maries and the angel adding their lyrical *planctus*, while the surroundings of the Nativity—the Shepherds, the Innocents, etc.—were linked with the Shepherds of Epiphany by a recitation of "Propheies," including Virgil and the Sibyl. Before long, from the 11th century onward, mysteries, as they were called, were produced in France on scriptural subjects such as the Wise and Foolish Virgins Adam (with the fall of Lucifer), Daniel, Lazarus etc. These mysteries and miracles being as yet represented by the clergy only, the language in which they were usually written is Latin, the earliest example in the vernacular being the 11th-century mystery of the Resurrection.

Mysteries, Miracles and Moralities—It is usual to divide the productions of the medieval religious drama into three classes. The mysteries proper deal with scriptural events only, and set forth with the aid of the prophetic history of the Old Testament and the fulfilling events of the New the central mystery of the Redemption of the world, as accomplished by the Nativity, the Passion and the Resurrection. But in fact these were not kept distinctly apart from the miracle plays, or miracles, which are strictly speaking concerned with the legends of the saints. Thirdly, the moralities, or moral plays, teach and illustrate the same truths allegorically, their characters being personified virtues or qualities.

As the plays grew more elaborate and their spectators more numerous, they began to be represented outside as well as inside the churches, at first in the churchyards, and in the vulgar tongue. A Beverly Resurrection play (c. 1200) and some others are bilingual. Miracles were less dependent on this connection with the church services than mysteries proper, and lay associations, guilds in particular, soon began to act plays in honour of their patron saints in or near their own halls. Lastly, as some of these characters came to be depended on by the audiences for conventional extravagance or fun, every new Herod seeking to out Herod his predecessor, and the devils asserting themselves as indispensable favourites, the comic element in the religious drama increased, and that drama itself grew more profane. The endeavour to sanctify the popular tastes to religious uses, which connects itself with the institution of the great festival of Corpus Christi (1264, confirmed 1311), when the symbol of the mystery of the Incarnation was borne in solemn procession, led to the closer union of the dramatic exhibitions (hence often called *processus*) with this and other religious feasts, but it neither limited their range nor controlled their development.

France—In France, where dramatic performances had never fallen entirely into the hands of the clergy, the progress was speediest and most decided toward forms approaching those of the modern drama. The earliest play in the French tongue, however, the 12th century *Adam*, supposed to have been written by a Norman in England (as is a fragmentary *Résurrection* of much the same date), still reveals its connection with the liturgical drama. Jean Bodel of Arras' miracle play of *St Nicolas* (before 1205) is already the production of a secular author, and has some realistic features. On the other hand, the *Theophilus* of Rutebeuf (d. c. 1280) treats its Faustlike theme in a rather lifeless form but in a highly religious spirit, and belongs to the cycle of miracles of the Virgin, of which examples abound throughout this period. Easter or Passion plays were fully established in the towns of France by the end of the 14th century, and in 1402 the *Conférence de la Passion* obtained a royal privilege for their performance.

Of these series of religious plays perhaps the most notable (c. 1450) is that by Arnoul Greban, a canon of Le Mans. Its revision, by Jean Michel (first performed at Angers in 1486), was very popular. Still more elaborate is the Rouen Christmas mystery of 1474, and the celebrated *Mystère du Vieux Testament*, produced at Abbeville in 1458 and performed at Paris in 1500. Most of the Provençal Christmas and Passion plays date from the 14th century, as well as a miracle of St Agnes. The miracles of saints were popular in all parts of France, and the diversity of local colouring contributed materially to the growth of the early French

drama.

The earliest known secular plays presented by university students in France were moralities, performed in 1426 and 1431. These plays depicting the struggle between good and evil in the human soul, become more frequent from about this time. Now it is (at Rennes in 1439) the contention between *Bien avoir* and *Mal avoir*, now, one between *l'homme juste* and *l'homme mondain*. Political and social problems are likewise similarly treated, the *Mystère du Conseil de Bale*—a historical morality—dates back to 1432, and in 1507 there is even found a hygienic or abstinence morality (by N de la Chesnaye) in which "Banquet" enters into a conspiracy with "Apoplexy," "Epilepsy" and "the whole regiment of diseases."

From the beginning of the 14th century onward the famous fraternity of the Basoche (clerks of the *parlement* and the *châtelet*) had been entrusted with the conduct of popular festivals at Paris, and had performed plays. But after the *Confrérie de la Passion* had monopolized the religious drama, the basochiens confined themselves to moralities and farces, in which political satire found a place. A third association, the *Enfants Sans Souci*, had, apparently also early in the 15th century acquired celebrity by its performances of short comic plays called *saturs*, not very distinct from the farces of the Basoche. Other confraternities and associations readily took a leaf from the book of these devil may care good fellows and interwove their religious and moral plays with comic scenes and characters from actual life, thus unconsciously preparing the transition to the regular drama.

The earliest known example of a serious secular play written in the French tongue is the *Estoire de Griseldis* (1393) which is largely indebted to Petrarch. The *Mystère du siège d'Orléans*, on the other hand, written about half a century later, in the epic tediousness of its manner comes near to a chronicle history, and interests us chiefly as the earliest of many efforts to bring Joan of Arc on the stage. Jacques Milet's celebrated mystery of the *Destruction de Troye la Grant* (1452) seems to have been addressed to readers and not to hearers only. The beginnings of the French regular comic drama are more difficult to ascertain. But there is ample evidence that the most famous of all mediaeval farces, the immortal *Maître Pierre Pathelin* (otherwise *L'Apocathelin*), was written before 1470 and acted by the *basochiens*, and we may conclude that his delightful story of the hater bit and the profession outwitted typifies a multitude of similar comic episodes of real life, dramatized for the delectation of clerks, lawyers and students and of all lovers of laughter.

Other Countries—In the neighbouring Netherlands many Easter and Christmas mysteries are noted from the middle of the 15th century, and with them the celebrated series of the Seven Joys of Mary. To about the same date belongs the small group of *abele spelen* (as who should say plays easily managed), chiefly on chivalrous themes. The moralities were specially cultivated during this century by the *Rederijkers* (rhetoricians)—civic associations which cultivated learned poetry and took an active share in the festivals that formed one of the most characteristic features of the life of the Low Countries. Among these moralities was that of *Blickerlye* (printed 1495), which is regarded as the original of the finest of English moralities, *Everyman*.

In Italy traces of the liturgical drama are few and confined to the northeast. The collective mystery so common in other western countries, is represented by a single example only—a *Passione di Gesù Cristo*, performed at Revello in Saluzzo in the 15th century—though there are some traces of other cyclic dramas of the kind. The Italian religious plays, called *figure* when on Old, *vangelis* when on New, Testament subjects, differ from those of northern Europe chiefly by the lesser degree of coarseness in their comic characters, and seem largely to have developed from the processional element in the festivals of the church. Besides such processions as that of the Three Kings at Epiphany in Milan, there were the penitential processions and songs (*laude*), which at Assisi, Perugia and elsewhere already contained a dramatic element, and at Siena, Florence and other centres these again developed into the so-called (*saecre rappresentazioni*). Such

a piece was the *San Giovanni e San Paolo* (1489), by Lorenzo the Magnificent, another was the *Santa Teodora*, by Luigi Pulci (d. c. 1484), *San Giovanni Gualberto* (of Florence) treats the religious experience of a latter day saint, *Rosana e Ulmuto* is a love story with a Christian moral. Passion plays were performed at Rome in the Coliseum by the Compagnia del Gonfolone, but there is no evidence of this before the end of the 15th century. In general, the spectacular magnificence of Italian theatrical displays accorded with the growing pomp of the processions, both ecclesiastical and lay, called *trionfi* already in the days of Dante, while the religious drama gradually acquired an artificial character and elaboration of form assimilating it to the classical attempts, to be noted below, which gave rise to the regular Italian drama.

In Spain hardly a monument of the mediaeval religious drama has been preserved. There is manuscript evidence of the 11th century attesting the early addition of dramatic elements to the Easter office, and a Spanish fragment of the Three Kings Epiphany play, dating from the 12th century, is one of the very earliest examples of the mediaeval drama in the vernacular. But that religious plays were performed in Spain is clear from the permission granted by Alfonso X of Castile (d. 1284) to the clergy to represent them, while prohibiting *juegos de escarnio* (mocking plays).

The German religious plays in the vernacular, the earliest of which date from the 14th and 15th centuries and were produced at Trier, Wolfenbützel, Innsbruck, Vienna, Berlin, etc., were of a simple kind, but in some of them, though they were written by clerks, there are traces of the minstrel's hands. The play of *The Wise and the Foolish Virgins*, in a Thuringian manuscript thought to be as early as 1328, a piece of remarkable dignity, was evidently based on a Latin play. In the same century miracle plays began to be performed in honour of St Catherine, St Dorothea and other saints. The Corpus Christi plays, or *Frohnleichnamsspiele*, are notable, since that of Innsbruck (1391) is probably the earliest extant example of its class.

The number of nonscriptural religious plays in Germany was much smaller than that in France, but the theme of the last judgment was common in Germany in the later middle ages. Of this theme *Antichrist* may be regarded as an episode, though in 1469 an *Antichrist* appears to have occupied at Frankfurt four days in its performance. The earlier (12th century) *Antichrist* is unique of its kind, this political protest breathes the Ghibelline spirit of the reign (Frederick Barbarossa's) in which it was composed. While the Shrove Tuesday plays (*Fasnachtsspiele*) of the professional strollers (*fahrende Leute*) reproduced the practical fun of common life, they occasionally, as in the Lubeck *Fasnachtspiel* of the five virtues, contained an element of the morality, but the main productivity of the writers of moralities and cognate productions falls into the periods of Renaissance and Reformation.

The performance of miracle plays is traceable in Sweden in the late 14th century, and the Germans who immigrated into the Carpathian lands, and into Poland in particular, in the later middle ages brought with them their religious plays. This fact is the more striking, as, though Czech Easter plays were performed about the end of the 14th century, none are known among the Magyars or among their neighbours of the eastern empire.

Religious Drama in England.—Coming now to the English religious drama, we find that from its extant literature a fair general idea may be derived of the character of these mediaeval productions. The miracle plays, miracles or plays (these being the terms used in England) of which we hear in London in the 12th century were probably written in Latin and acted by ecclesiastics, but in the following century mention is made—in the way of prohibition—of plays acted by professional players. In England as elsewhere, the clergy either sought to control the religious plays, which were occasionally acted in churches even after the Reformation, or else reprobated them, with or without qualifications. In Cornwall miracles in the native Cymric dialect were performed at an early date in extensive amphitheatres constructed for the purpose—two of which, at St Just near Penzance, and Perranzabuloe, are still extant, but the miracles which have

been preserved are apparently copies of English or French originals.

The flourishing period of English miracle plays begins with the practice of their performance by trading companies in the towns. Of this practice Chester is said to have set the example (1268–69), which was followed by many other towns. These towns with their neighbourhoods include, starting from East Anglia, where the religious drama was particularly at home Wymondham, Norwich, Sleaford, Lincoln, Leeds, Wakefield, Beverley, York, New castle upon Tyne, with a deviation across the border to Edinburgh and Aberdeen. In the northwest they are found at Kendal, Lancaster, Preston, Chester, whence they may be supposed to have migrated to Dublin. In the west they are noticeable at Shrewsbury, Worcester and Tewkesbury, in the midlands at Coventry and Leicester, in the east at Cambridge and Basingbourne, Heybridge and Munningtree, to which places have to be added Reading, Winchester, Canterbury and London, in which last the performers were the parish clerks. Four collections, in addition to some single examples of such plays, have come down to us: the York plays, the so-called *Towneley* plays, which were probably acted at the fairs of Widdikirk, near Wakefield, and those bearing the names of *Chester* and of *Coventry*. Their dates are more or less uncertain, that of the York seems to be earlier than that of the *Towneley*, which were probably put together about the middle of the 14th century, the *Chester* may be ascribed to the 14th or early 15th, the body of the *Coventry* to the 15th or 16th. Many of the individual plays in these collections were doubtless founded on French originals, others are taken direct from Scripture, from the apocryphal gospels, or from the legends of the saints. Their characteristic feature is the combination of a whole series of plays into one collective whole, exhibiting the entire course of Bible history from the creation to the day of judgment. The oldest of the series—the York plays—exhibits a fairly close parallel to the scheme of the *Cursus mundi* (q.v.). Among the isolated plays may be mentioned *The Hurrowing of Hell* and several belonging to a series known as the *Digby Mysteries*, including *Parfere's Candlemas Day* (the massacre of the Innocents) and the miracle of *Mary Magdalene*. Of the so-called "paternoster" and "creed" plays (which exhibit the miraculous powers of portions of the church service) no example remains, though of some we have an account, the Croxton *Play of the Sacrament*, the late 15th century manuscript of which is preserved at Dublin, exhibits the triumph of the holy wafer over wicked Jewish wiles.

Each play was performed by the representatives of a particular trade or company, after whom it was called the fishers' gloves', etc., pageant, a general prologue was spoken by a herald. As a rule the movable stage sufficed for the action, though we find horsemen riding up to the scaffold, and Herod instructed to "rage in the pagod and in the strete also." There is no evidence that the stage was, as in France, divided into three platforms with a dark cavern at the side of the lowest, appropriated respectively to the Heavenly Father and his angels, to saints, to mere men and to souls in hell. But hell was frequently displayed in the English miracles, with or without fire in its mouth.

The costumes were in part conventional—divine and saintly personages being distinguished by gilt hair and beards, Herod being clad as a Saracen, the demons wearing hideous heads, the souls black and white coats according to their kind and the angels gold skins and wings. The plays contained an element of humour, often broadly farcical, but much that seems ludicrous or coarse to modern standards of taste would not have so struck contemporaries. The York Corpus Christi plays (48) are comparatively free from the tendency to jocularly and vulgarity observable in the *Towneley*, several of the plays concerned with the New Testament and early Christian story are, however, in substance common to both series. The *Towneley* plays or *Wakefield* mysteries (32), composed by the friars of Widdikirk or Nostel, are of a popular character, and are superior in vivacity and humour to both the later collections. The *Chester* plays (25) were indebted to the *Mystère du Vieux Testament* and to earlier French mysteries, they are less popular in character than the two earlier cycles, and on the

whole undistinguished by pathos or humour. While these plays were performed at Whitsuntide, the *Coventry* plays (42) were Corpus Christi performances. They are far more effectively written than the *Chester* plays, and occasionally rise to real dramatic force. In the *Coventry* series there is already to be observed an element of abstract figures, which connects them with the moralities.

English Moralities—The moralities corresponded to the love for allegory which, while dominating the whole field of mediaeval literature, was nowhere more evident than in England. Moreover, a specially popular element was supplied to these plays in a character borrowed from the miracles and usually provided with a companion whose task it was to lighten the weight of such abstractions as Sapience and Justice. These were the Devil and his attendant, the Vice, of whom the latter seems to have been of native origin, and, as he was usually dressed in a fool's habit, was probably suggested by the custom of keeping an attendant fool at court or in great houses. The Vice had many aliases (Shift, Ambidexter, Sin, Fraud, Iniquity, etc.), but his usual duty was to tease the Devil his master for the edification and diversion of the audience. He was gradually blended with the domestic fool, who survived in the regular drama.

The earlier English moralities—from the reign of Henry VI to that of Henry VIII—usually allegorize the conflict between good and evil in the mind and life of man, without any side intention of theological controversy. Such also is still essentially the purpose of the extant morality, *Magnificence*, by Henry VIII's poet, the witty Skelton. *Everyman* (c. 1539), perhaps the most perfect example of its class, contains passages certainly designed to enforce the specific teaching of Rome. But its Dutch original was written at least a generation earlier, and could have no controversial intention. On the other hand, R. Wever's *Lusty Juventus* breathes the spirit of the dogmatic reformation of the reign of Edward VI. Theological controversy largely occupies the moralities of the earlier part of Elizabeth's reign, and connects itself with political feeling in Sir David Lindsay's *Saetre of the Three Estatis*, written and acted (at Cupar, in 1559) on the other side of the border, where the religious drama proper had been extinguished by the Reformation. Only a single English political morality proper remains to us, which belongs to the beginning of the reign of Elizabeth (*Albion Knight*). Another series connects itself with the ideas of the Renaissance rather than the Reformation, treating of intellectual progress rather than of moral conduct, thus extending from the reign of Henry VIII to that of Elizabeth. Besides these, there remain some Elizabethan moralities which have no special theological or scientific purpose, and are none the less lively in consequence.

The transition from the morality to the regular drama in England was effected, on the one hand, by the intermixture of historical personages with abstractions—as in Bishop John Bale's *Kyng Iohā* (c. 1538)—which easily led over to the chronicle history, on the other, by the introduction of types of real life by the side of abstract figures. This latter tendency is observable in several of the 16th-century moralities, but before most of these were written, a further step had been taken by a man of genius, John Heywood (b. c. 1500, d. between 1577 and 1587), whose "interludes" were short farces in the French manner. Heywood's interludes dealt entirely with real—very real—men and women. Other writers, such as T. Ingeland, took the same direction, and the allegory of abstractions was thus undermined on the stage. Thus the interludes facilitated the advent of comedy, without having superseded the earlier form. Both moralities and miracle plays survived into the Elizabethan age after the regular drama had already begun its course.

Bibliography—The following works treat of the mediaeval drama, religious or secular. H. Anz, *Die lateinischen Mysterien* (Leipzig, 1905); E. K. Chambers, *The Medieval Stage*, 2 vol., bibl. (1903); E. de Coussemaker, *Drame liturgique du moyen âge* (1861); P. Duméril, *Théâtre liturgique que Latona superavit monumenta* (Caen and Paris, 1849); W. The revival of the classical drama in the Renaissance age is treated in P. Bahlmann, *Die Erneuerung des antiken Dramas und ihre ersten dramatischen Versuche*, 1314-1478 (Münster, 1896); A. Chassagny, *Des essais dramatiques imités de l'antiquité au XIV^e et XV^e siècles* (1852); V. de Amatus, *L'immissione latina nella commedia del XVI secolo* (Pisa, 1871).

Both the mediaeval and portions of the later drama are treated in W. Cloetta, *Beiträge zur Literaturgeschichte des Mittelalters und der Renaissance*, 4 vol. (Halle, 1890-91); W. Creizenach, *Geschichte des neueren Dramas*, vol. 1-iii (Halle, 1891-1901); R. Probs, *Geschichte des neueren Dramas*, 3 vol. (Leipzig, 1881-83). See also L. V. Goffart, *Le Théâtre au collège, du moyen âge à nos jours*, preface by Jules Claretie (1907) (J. R. A. N. X.)

THE MODERN NATIONAL DRAMA

ENGLISH DRAMA

Early Tudor Drama—Modern investigation has shown that English secular drama takes its beginning from the earliest Tudor period, and in all probability from the end of the 15th century. *Fulgens and Lucres* (a copy of which came to light in 1919), an interlude by Henry Medwall, chaplain to John Cardinal Morton, may be dated about 1496. Its theme, the contest between a plebeian love-loving patrician and a high-principled commoner for the hand of Lucres, is based upon a humanist tale, it anticipates Shakespearean technique by adding a comic underplot which is a variation of the main subject. Medwall's other extant play, *Nature*, though in form a morality, shows much of the technical skill and realistic observation of *Fulgens and Lucres*. John Rastell, brother-in-law of Sir Thomas More, who printed *Fulgens and Lucres*, was himself the author of *The Interlude of the Four Elements* and of *Gentleness and Nobility*, two didactic plays, without action, but reflecting his interest in scientific and social problems. He also probably adapted from its Spanish source the fragmentary romantic drama *Calisto and Melibea*. John Rastell's daughter, Joan, married John Heywood, with whose name six interludes are traditionally associated. His authorship of four of these, the manuscript *Witty and Wileless*, the *Play of Love* and the *Play of the Weather* (both printed by his brother-in-law, William Rastell)

and *The Four PP* (printed by W. Middleton), is beyond reasonable doubt. *Wether* and *The Four PP* have a raciness of dialogue and characterization that is almost Chaucerian. Two other, more acidly farcical, plays, *Johan Johan* and *The Pardoner and the Frere*, have points of affinity with *The Four PP*, but there is no external evidence for Heywood's authorship of these. It has been suggested that they may have been among the *comœdiæ juveniles* attributed by Bale to Sir Thomas More. In any case all the plays mentioned above form an early Tudor group, predominately English in spirit and treatment, unaffected in their construction by classical influences.

It was chiefly through the schools and universities that these influences gradually spread and, blending with native and traditional elements, produced the distinctively Elizabethan "romantic" types of comedy and tragedy. The boys of St. Paul's school acted plays of Plautus and Terence before Thomas Cardinal Wolsey in 1527 and 1528, and among the performances, which were part of the regular curriculum at Eton, Westminster Merchant Taylors' and other schools, the two masters of Roman comedy had an important place. Scarcely less influential were a group of continental neo-Latin playwrights such as Johannes Ravius Textor, Georgius Macropeides and Gulielmus Fullonius (Gnapheus), whose dramas on the theme of the prodigal son gained great popularity. The most famous of these, the *Acolastus* of Gnapheus, was issued in England with a translation by John Palsgrave in 1540.

Classical, neoclassical and native elements are blended in the work of Nicholas Udall, successively headmaster of Eton and Westminster. His *Ralph Roister Doister*, a clever adaptation to English conditions of types from the *Miles Gloriosus* of Plautus, was probably written in 1553 when he was "schoolmaster" to Bishop Stephen Gardiner, and is the first English play divided into acts on the classical model. Udall was also probably the author about 1537 of the clever adaptation of Textor's dialogue, *Thersites*, and there is reason to suppose that his biblical play, *Esechnas* (revived at Cambridge before Elizabeth in 1564), was another early work. Another attractive biblical play, *Jacob and Esau*, has features in common with *Roister Doister*, and may well be from Udall's pen. *Jacob and Esau* belongs to the prodigal son class, and other variations on this type are Thomas Ingelend's *The Disobedient Child*, adapted from a Textor dialogue, the powerful anonymous *Misogonus*, and George Gascoigne's *The Glasie of Government* (1575), heavily didactic, but notable as the first prodigal son play written in prose.

It was not from the neoclassical but from the Italian drama, however, that the English amateur stage had taken the crucial step of borrowing prose as the instrument of comedy. In 1566 Gascoigne had translated for performance before the lawyers of Gray's Inn Lodovico Ariosto's *Gli Suppositi*, of which there were both prose and verse forms, but which he turned entirely into English prose. For a time his innovation found no imitators. *The Bugbears*, another (anonymous) adaptation of an Italian comedy, J. Phillip's recently recovered *Patient Grissell* and the numerous lost plays on Italian themes mentioned in the Revels' accounts were (so far as is known) in the traditional rhyming metres. So also were the few plays still surviving from the early years of Elizabeth's reign on purely English themes, such as *Tom Tyler* and *His Wife* and the admirably constructed Cambridge farcical comedy, whose authorship is still a problem, *Gammer Gurton's Needle*. In another group, represented by *Common Conditions*, *The Rare Triumphs of Love and Fortune* and *Sir Clyomon and Sir Clamides*, romantic subjects, sometimes combined with allegorical features, were boldly but unskillfully handled.

Influence of Seneca.—If English comedy intermingled traditional native elements with those borrowed from ancient and Renaissance Italy, English tragedy in its beginnings was predominantly indebted to one classical source, the rhetorical drama of imperial Rome. In the year of Elizabeth's accession a group of English university scholars began to put forth a series of translations of the ten tragedies of Seneca, which one of them, Thomas Newton, in 1581 collected into a single volume. To the direct influence of Seneca is to be ascribed the composition of the first Eng-

lish tragedy which we possess. *Go-boduc* or *Ferrex and Porrex*, by Thomas Norton and Thomas Sackville, was first acted on Jan. 18 1562, by the members of the Inner Temple before Queen Elizabeth. Though its subject is a British legend, and though the action is neither copied nor adapted from any treated by Seneca, yet the resemblance between this tragedy and the *Thebas* is too strong to be fortuitous. In all formal matters—chorus, messengers, etc.—*Go-boduc* adheres to the usage of classical tragedy, but the authors show no respect for the unities of time or place and they introduce before each act the nonclassical device of a dumb show. What gives the play its chief importance is the use, for the first time in English drama of blank verse. The model of *Go-boduc* was followed at Gray's Inn in 1566 when Gascoigne produced with the aid of two associates (F. Kynwelmarsh and Sir C. Yelverton) *Jocasta*, a virtual translation of L. Dolce's *Gioacasta*, which was an adaptation of a Latin translation of the *Phœnissæ* of Euripides. R. Edwards' *Damon and Pithias* (c. 1564–65) shades off from tragedy into what soon came to be called tragicomedy. More rudely constructed plays of the same class, also on classical themes, are J. Pickering's *Horestes* (1567), Richard Bowser's *Apus and Virginia* (1575) and T. Preston's *Camisses* (c. 1569). Two more notable examples have Italian sources. *Gismonde of Salerne*, drawn from Boccaccio, was acted before Queen Elizabeth at the Inner Temple in 1568, nearly a generation before it was published, rewritten in blank verse by R. Wilmot, one of the performers. G. Whetstone's *Promos and Cassandra*, founded on a tale by G. Cinthio (from which came the plot of *Measure for Measure*) followed in 1578.

In addition, the universities provided a field for neo-Senecan tragedy and tragicomedy, both in Latin and English. N. Grimald's *Christus Redivivus* and *Archpropheta* (on John the Baptist) were followed from 1581 onward by W. Gager's series of Latin plays at Christ Church, Oxford, of which *Ulysses Redivivus* is the most notable. At Cambridge T. Watson's *Abolom*, J. Christopherson's *Jephtha* (both in Greek and Latin) and T. Legge's *Richardus III* (1579) cast biblical or national history into classical moulds.

Chronicle Histories.—From the double danger which threatened English tragedy in the days of its infancy—that it would congeal on the wintry heights of classical themes, or dissolve its vigour in the glowing heat of a passion fiercer than that of the Italians—it was in part preserved by its association with the traditions of the national history. An exceptional position might seem to be in this respect occupied by T. Hughes's tragedy *The Misfortunes of Arthur* (1587). But the author of this play—in certain portions of whose framework there were associated with him seven other members of Gray's Inn, including Francis Bacon, and which was presented before Queen Elizabeth like *Go-boduc*—followed the example of the authors of *Go-boduc* in choice of theme, details of form and a general though free imitation of the manner of Seneca, with some borrowings from Lucan.

Fortunately at this time a new sphere of activity suggested itself in which English dramatists speedily came to feel at home. In their dramatization of portions of English history classical models would be of scant service, while Italian examples of the treatment of national historical subjects, having to deal with material so wholly different, could not be followed with advantage. Nor did Bishop Bale's experiment in *Kynge Johan* (c. 1548) of combining historical matter with personifications such as Sedition find imitators. The typical English chronicle history, which designedly assumed this name in order to make clear its origin and purpose, essayed nothing more or less than a dramatic version of an existing chronicle. Obviously, while the transition from half historical, half epical narrative often implied carrying over into the new form some of the features of the old, it was only when the subject matter had been remoulded and recast that a true dramatic action could result. But the histories to be found among the plays of Shakespeare and one or two other Elizabethans are true dramas, and it would be inconvenient to include these in the transitional species of those known as chronicle histories. Among these is *The Famous Victories of Henry the Fifth*, known to have been acted before 1588, in which both the verse and the prose are

frequently of a very rude sort but which has considerable vigour and freshness. Another is *The Troublesome Raigne of King John*, in two parts (1591), neither a didactic effort like Bale's, nor a living drama like Shakespeare's, but in its own way an effective treatment of its historical theme. The *True Chronicle History of King Lear* (first acted c. 1593-94) seems, with all its defects, only to await the touch of the master's hand to become a tragedy of supreme effectiveness.

Elizabethan Theatres and Companies—Out of such promises as these the glories of English drama were ripened by the warmth and light of the great Elizabethan age—of which the beginnings may fairly be reckoned from the third decade of the reign to which it owes its name. Against the attacks which a nascent Puritanism was already directing against the stage by the hands of J. Northbrooke, the repentant playwright S. Gosson, P. Stubbes and others were to be set the steady though frugal favour of royalty and the more liberal patronage of great nobles. This patronage was made a necessity by the act of 1572 by which all common players were declared rogues and vagabonds unless they were in the service of some lord. Hence the rapid development of companies bearing the name of a prominent nobleman, of which the two chief in the later years of Elizabeth were known as the lord chamberlain's (including Richard Burbage, William Kempe and Shakespeare) and the lord admiral's (of which Edward Alleyn was the leading figure).

These organized companies needed permanent playhouses, of which the first, the Theater, was built by J. Burbage in Shoreditch in 1576, and was soon followed by the Curtain in Finsbury. These were the predecessors of the Rose and the Swan, the Globe and the Fortune, the first and the second Blackfriars theatres. How intimately the construction of Elizabethan plays is bound up with the "platform stage" of these theatres and with the absence of a drop curtain has been made increasingly clear by modern research. And the employment of boys in women's parts accounts for the numerous plots in which the heroine dons doublet and hose. Nor did the "little eyases" perform only in the professional companies. The children of the chapel and the children of Paul's (the choristers of the chapel royal and the cathedral) stood midway between the young professionals and the purely amateur school boys.

Shakespeare's Predecessors—It was for the children of the chapel and the children of Paul's that John Lyly wrote his plays. Some features of the euphuism, to which his famous romance gave its name, reappear in his mythological, quasi-historical, allegorical comedies. But his real service to the progress of English drama is to be sought neither in his choice of subjects nor in his imagery—though to his fondness for fairy lore and for the whole phantasmagoria of legend, classical as well as romantic, his contemporaries, and Shakespeare in particular, were indebted. It does not even lie in the songs interspersed in his plays, which did not appear till the publication of the edition of 1632 and are of doubtful authorship. It consists in his adoption of Gascoigne's innovation of writing plays in prose, and in his having, though with elements of an affected style, given the first example of brisk and vivacious dialogue—an example to which even such successors as Shakespeare and Jonson were indebted. Thomas Kyd, the author of the *Spanish Tragedy*, had the born playwright's instinct for effective situations, often but not always of a lurid kind, and may have preceded Christopher Marlowe in the use of blank verse on the popular stage. He almost certainly wrote a lost play on *Hamlet*, which *Soliman and Perseda* and *Arden of Feversham* belong to his school if not to his pen. Marlowe's earliest play, *Tamburlaine the Great*, captured the theatrical public by its "high astounding terms" in which the hero's passion for infinite power found superb though at times too grandiloquent utterance. In *Doctor Faustus* the passion for infinite knowledge and in *The Jew of Malta* the passion for infinite wealth (both as sources of power) are the leading motives. In *Edward II* the colours are quieter but there is an advance in dramatic technique, and the closing scenes are marked by truly tragic pity and terror. Compared with *Edward II*, George Peele's *Chronicle of Edward I* still stands on the level of the species to which its title and character alike assign it. Peele's finest play is

David and Bethsabe, which resembles *Edward I* in construction but surpasses it in beauty of language and versification, besides treating its subject with superior dignity. We seem to come into something like a Shakespearean atmosphere in more than one passage of the plays of Robert Greene. His art, most conspicuous in plays treating English life and scenes, could at times free itself from the pedantry apt to beset the flight of Peele's and at times even of Marlowe's muse. His most delightful work, *Friar Bacon and Friar Bungay*, seems to breathe something of the air which blows over an English countryside. Thomas Lodge, Thomas Nashe, Henry Chettle and Anthony Munday, who wrote the original text of the composite play *Sir Thomas More* (of which Shakespeare has been credited with three leaves in the manuscript) and other works, are among the other more important writers of the early Elizabethan drama.

Although the chief of these poets are marked off from one another by the individual genius which impressed itself upon both the form and the matter of their works, yet the stamp of the age is upon them all. Writing for the stage only, of which some of them possessed a personal experience, they acquired an instinctive insight into the laws of dramatic cause and effect, and infused a warm vitality into the dramatic literature which they produced, so to speak, for immediate consumption. On the other hand, the same cause made rapidity of workmanship indispensable to a successful playwright. How a play was produced, how many hands had been at work upon it, what loans and what spoliations had been made in the process, were considerations of less moment than the question whether it was produced, and whether it succeeded.

This period of the English drama could not therefore yet be one of full consummation. In tragedy the advance which had been made in the choice of great themes, in knitting closer the connection between the theatre and the national history, in vindicating to passion its right to adequate expression, was already enormous. In comedy the advance had been less decisive and less independent, much had been gained in reaching greater freedom of form and something in enlarging the range of subjects, but artificiality had proved a snare in one direction, and the licence of the comic stage in another.

Shakespeare—These were the circumstances under which the greatest of dramatists began to devote his genius to the theatre. William Shakespeare's (q.v.) career as a writer of plays cannot have differed little in its beginnings from those of his contemporaries and rivals. Before or while he was proceeding from the retouching and rewriting of the plays of others to original dramatic composition, the most gifted of his predecessors had died. Shakespeare was no doubt happy in his times, which intensified the strength of the national character, expanded the activities of the national mind and were able to add their stimulus even to such a creative power as his. He was happy in the antecedents of the form of literature which commended itself to his choice, and in the opportunities which it offered in so many directions for an advance to heights yet undiscovered and unknown.

The great and irresistible demand on the part of Shakespeare's public was for incident—a demand which of itself necessitated a method of construction different from that of the Greek drama or of those modelled more or less closely upon it. Hence in part arises the circumstance that Shakespeare so constantly combined two actions in the course of a single play, not merely supplementing the one by means of the other as a byplot or underplot. And where he thus led many have followed. Should it, however, be sought to express in one word the greatest debt of the drama to Shakespeare, this word must be the same as that which expresses his supreme gift as a dramatist. It is in *characterisation*—in the drawing of characters ranging through almost every type of humanity which furnishes a fit subject for the tragic or the comic art—that he remains absolutely unapproached, and it was in this direction that he pointed the way which the English drama could not henceforth desert without becoming untrue to itself.

Pastoral and Masque—By the numerous body of poets who, contemporary with Shakespeare or in the next generation, cultivated the wide field of the national drama, every form commending itself to the tastes and sympathies of the national genius was

essayed None was neglected except those from which the spirit of English literature had been estranged by the Reformation, and those which had from the first been artificial importations of the Renaissance. The mystery could not in England, as in Spain, produce such an aftergrowth as the *auto*, and the confines of the religious drama were only now and then tentatively touched. The direct imitations of classical examples were few and feeble. Samuel Daniel (1562-1619) may be regarded as a belated disciple of Seneca, while experiments like Sir W. Alexander's *Monarchick Tragedies* (1603-05) are the isolated efforts of a student. At the opposite end of the scale, the light gaiety of the Italian and French farce could not establish itself on the English popular stage without more substantial adjuncts, the Englishman's festive digestion long continued robust, and he liked his amusements solid. In the pastoral drama and the masque, however, many English dramatists found opportunities for the exercise of their lyrical gifts and of their inventive powers. The former could never become other than an exotic, so long as it retained the artificial character of its origin. Shakespeare had accordingly only blended elements derived from it into the action of his romantic comedies. In more or less isolated works Ben Jonson, John Fletcher, Daniel, Thomas Randolph and others sought to rival Torquato Tasso and Giovanni Guarini—Jonson in *The Sad Shepherd* coming nearest to nationalizing an essentially foreign growth by the fresh simplicity of his treatment, Fletcher in *The Faithful Shepherdess* by beauty of poetic execution, Daniel in *The Queen's Arcadia* by simpler beauties of style in both verse and prose.

The masque was a more elastic kind of composition, mixing in varying proportions its elements of declamation and dialogue, music and dancing, decoration and scenery. It was introduced, after the manner of Italy, at the court of Henry VIII in 1512. A frequent ornament of Queen Elizabeth's court festivities and progresses, it was cultivated with increased assiduity in the reign of James I, and in that of his successor rivalled, by the favour it enjoyed, the attractions of the regular drama itself. Most of the later Elizabethan dramatists contributed to this species, but by far the most successful writer of masques was Ben Jonson, of whose numerous compositions of this kind many hold a permanent place in English literature, and "next" to whom, in his own judgment, "only Fletcher and Chapman could write a masque." From a poetic point of view, however, they were at least rivalled by Daniel, William Browne and Thomas Carew, in productivity and favour. Thomas Campion for a time excelled. It was for the performance of a masque in a great nobleman's castle that Milton in 1634 wrote one of the loftiest and loveliest of English poems (*Comus*). In later times the masque merged into the opera, or continued a humble life of its own apart from contact with higher literary effort.

Later Elizabethan Drama.—The annals of English drama proper in the period reaching from the closing years of Elizabeth to the outbreak of the great Revolution include, together with names relatively insignificant, many illustrious in the history of English poetic literature. Among Shakespeare's contemporaries and successors Jonson alone by the energy of his genius, not less than by the circumstances of his literary career, reached undisputed primacy among his fellows. Yet his pre-eminence did not extend to both branches of the regular drama. In tragedy he fell short of the highest success, the weight of his learning lay too heavily upon his efforts to draw from deeper sources than those which had sufficed for Shakespeare. Such as they are, his tragic works stand alone, though not quite, alone in his period as examples of sustained effort in historic tragedy proper. George Chapman treated stirring themes, especially from modern French history, with genuine effectiveness, but, though rich in beauties of detail, he failed in this branch of the drama to follow Shakespeare in the art of fully developing a character by means of the action. With the great body of the English dramatists of this and of the next period, tragedy had passed into a phase where its interest depended mainly upon plot and incident. The romantic tragedies and tragicomedies which crowd English literature at this time constitute together a growth of astonishing exuberance, and in mere externals of theme—ranging as these plays do from Byzantium to

ancient Britain, and from the Cæsars of ancient Rome to the tyrants of the Renaissance—of equally astonishing variety. The sources from which these subjects were derived had been perennially augmenting. Besides Italian, Spanish and French fiction, original or translated, besides British legend in its romance dress and English fiction in its humbler or in its more ambitious and artificial forms, the contemporary foreign drama, especially the Spanish, offered opportunities for resort. To the English as to the French and Italian drama of both this and the following century, the prolific dramatists clustering round Lope de Vega and Calderón and the native or naturalized fictions from which they drew their materials supplied a whole arsenal of plots—among others to Thomas Middleton, to John Webster and most signally to Francis Beaumont and John Fletcher. And, in addition to these resources, a new field of supply was at hand since English dramatists had begun to regard events and episodes of domestic life as fit subjects for tragic treatment. Domestic tragedy of this description was indeed no novelty on a stage which had produced *Arden of Feversham* and *A Yorkshire Tragedy*, but Thomas Heywood was the first playwright to be identified as having achieved works of distinctive originality in this class (*A Woman Killed with Kindness*, *The English Traveller*), to which some of the plays of Thomas Dekker, Middleton and others likewise more or less belong. Yet the number of *motives* employed—at least as a rule—in the tragic drama of this period was comparatively small and limited. Scheming ambition, conjugal jealousy, absolute female devotion, unbridled masculine passion—such are the motives which continually recur. But though the common features of the romantic tragedy are sufficiently marked they leave unobscured the distinctive features in its individual writers. In Webster, master as he is of macabre effects, and in John Ford, seductive in his sweetness, the monotony of exaggerated passion is broken by those marvellously sudden and subtle touches through which their tragic genius creates its most thrilling effects. Nor will the tendency to excess of passion which Beaumont and Fletcher exhibit be confounded with their distinctive power of sustaining tenderly pathetic characters and irresistibly moving situations in a degree unequalled by any of their contemporaries—a power seconded by a beauty of diction and softness of versification which for a time raised them to the highest pinnacle of popular esteem, and which entitles them in their conjunction, and Fletcher as an independent worker, to an enduring pre-eminence among their fellows. Distinctive, too, are the manliness of sentiment and occasionally greater width of outlook which ennoble the rhetorical genius of Philip Massinger, and the gift of poetic illustration which entitles James Shirley to be remembered not merely as the latest and the most fertile of this group of dramatists.

In comedy, on the other hand, the genius and the insight of Jonson pointed the way to a steady and legitimate advance. His theory of "humours" (which found the most palpable expression in two of his earliest plays), if translated into the ordinary language of dramatic art, signifies the paramount importance in the comic drama of the presentation of distinctive human types. In the actual reproduction of humanity in its infinite but never, in his hands, alien variety, it was impossible that Shakespeare should be excelled by Jonson, but in the consciousness with which he recognized and indicated the highest sphere of a comic dramatist's labours, he rendered to the drama a direct service which the greater master had left unperformed. By the rest of his contemporaries and his successors, some of whom, such as Richard Brome, were content avowedly to follow in his footsteps, Jonson was only occasionally rivalled in individual instances of comic creations, in the entirety of its achievements his genius as a comic dramatist remained unapproached in its own sphere. The favourite types of Jonsonian comedy, to which Dekker, John Marston and Chapman had added others of their own, were elaborated with incessant zeal by their contemporaries and successors. The inexhaustible verve of Middleton, the buoyant productivity of Fletcher, the observant humour of Nathan Field and the artistic versatility of Shirley mirrored in innumerable pictures of contemporary life the follies and foibles of mankind.

Later Academic Drama.—The academic drama of the later

Elizabethan period and of the first two Stuart reigns did not fall off either in activity or in variety from that of the preceding generations. At Oxford a long succession of English and Latin plays were performed, from the early years of the 17th century onward. The production of these plays was distributed among several colleges, among which the most conspicuously active were Christ Church and St. John's, where a series of performances took place in 1607-8 under the collective title of *The Christmas Prince*. Other notable Oxford plays are Daniel's pastoral drama *The Queen's Arcadia* (1605), Barten Hothday's *Technogamia* (1618), W. Strode's *Floating Island* and William Cartwright's *The Royal Slave* (1636), all of which formed part of royal entertainments. At Cambridge the list of plays performed in the latter half of Elizabeth's reign at Trinity, St. John's, Queens' and a few other colleges contains several of special interest. Among Latin comedies E. Forsett's *Pedantus*, probably acted at Trinity in 1581, ridicules Gabriel Harvey, *Laelia*, acted at Queens' in 1590 and again in 1598, resembles *Fifth Night* in part of its plot, while in *Silvanus*, performed in 1597 at St. John's, there are similarities to *As You Like It*. The most interesting of the English plays of the later Cambridge series are the *Parnassus Plays*, successively produced at St. John's in 1598-1602, which illustrated the unfortunate relations between university life and the outside world, including the world of letters and of the stage as represented by Shrike, spear's fellows Burbage and Kempe. Upon a different aspect of English university life—the relations between town and gown—a partisan light is thrown by *Club Law*, acted at Clare in 1599, and by G. Ruggle's Latin comedy of *Ignoramus*, twice acted by members of Clare at Trinity in 1615 before King James I. Other Cambridge English plays of note are T. Tomkiss' allegorical *Lingua* (1607) and Phineas Fletcher's *Scicelles* (1615), a "psaltic" (i.e., a pastoral drama) in which the place of the shepherds is taken by fishermen. Latin and English plays continued to be brought out in Cambridge till the year of the outbreak of the Civil War, Peter Hausted, Thomas Randolph and Abraham Cowley being among the authors of some of the latest so produced.

The Drama and Puritanism—Up to the outbreak of the Civil War the drama in all its forms continued to enjoy the favour of the court, although a close supervision was exercised over attempts to make the stage the vehicle of political references. The official agent of this supervision was the master of the revels, but under James I. a special ordinance, in harmony with the king's ideas concerning the dignity of the throne, was passed "against representing any modern Christian king in plays on the stage." But the sympathies of the dramatists were so entirely on the side of the court that the real difficulties against which the theatre had to contend came from an opposite quarter. With the growth of Puritanism the feeling of hostility to the stage increased in a large part of the population, well represented by the civic authorities of the capital. Puritans of the more pronounced type openly aimed at the permanent closing of the theatres. The war between them and the dramatists was acerbic of a life and death kind. On the one hand, the drama heaped its bitterness and often coarsest attacks upon whatever savoured of the Puritan spirit, gibes, taunts, caricatures in ridicule of Puritans furnish part of the comic literature of the later Elizabethan and Stuart drama. On the other hand, the looseness of tone, the mockery of ties sanctioned by law and consecrated by religion, the tendency to treat middle class life as the hunting ground for the diversions of the upper classes, which infected so much of the dramatic literature of the age, intensified the Puritan opposition to all and any stage plays. This was most loudly voiced in William Prynne's *Histrio-Mastix* (1632), which invoked its author in persecution but did not remain wholly without effect upon the tone of the dramatic literature of the subsequent period.

The quarrel between Puritanism and the theatre was, however, too old and too deep to end in any but one way, so soon as the latter was deprived of its protectors. The Civil War began in Aug. 1642, and early in the following month was published the ordinance of the lords and commons, which, after a brief and solemn preamble, commanded "that while these sad causes and

set times of humiliation do continue, public stage plays shall cease and be forborne." Though there is evidence that dramatic entertainments of one kind or another continued to be occasionally presented, stringent ordinances gave summary powers to magistrates against any players found engaged in such proceedings (1647), and bade them treat all stage players as rogues, and pull down all stage galleries, seats and boxes (1648). A few dramatic works were published in this period, while at fairs about the country were acted farces called "drolls," consisting of the most vulgar scenes to be found in popular plays. Thus the life of the drama was not absolutely extinguished.

Revival of the Drama—Already "in Oliver's time" private performances took place from time to time at noblemen's houses and (though not undisturbed) in the old haunt of the drama, the Red Bull. In 1656 the ingenuity of Sir William Davenant, whose name is memorable as connecting two distinct periods, ventured on a bolder step in the production of a quasi dramatic entertainment "of declamation and music", and in the following year he brought out with scenery and music a piece which was afterward acted in an enlarged form and printed as the first part of his opera *The Siege of Rhodes*. This entertainment he afterward removed from the private house where it had been produced to the Cockpit, where he soon ventured upon the performance of regular plays written by himself. Thus, under the cover of two sister arts, whose aid was in the sequel to prove by no means altogether beneficial to its progress, the English drama had boldly anticipated the Restoration, and was no longer hiding its head when that event took place. Soon after Charles II's entry into London, two theatrical companies are known to have been acting in the capital. For these companies patents were soon granted, under the names of "the Duke (of York's)" and "the King's Servants," to Davenant and Thomas Killigrew, respectively—the former from 1662 acting at Lincoln's Inn fields, then at Dorset garden in Salisbury court, the latter from 1663 at the Theatre Royal near Drury lane. These companies were united from 1668, a royal licence being granted in 1695 to a rival company which performed in Lincoln's Inn fields, and which migrated to Covent garden in 1733. Meanwhile, Vanbrugh had in 1705 built the theatre in the Haymarket, and a theatre in Goodman's fields—afterward rendered famous by the first appearance of David Garrick—led a fitful existence from 1729 to 1733. The act of 1737 deprived the crown of the power of licensing any more theatres, so that the history of the English stage for a long period was confined to a restricted area. The rule which prevailed after the Restoration, that neither of the rival companies should ever attempt a play produced by the other, operated beneficially both upon the activity of dramatic authorship and upon the progress of the art of acting. This art has rarely flourished more in England than in the days of Thomas Betterton and his contemporaries, including Charles Hart, Michael Mohun, Edward Kynaston, James Nokes or Nokes, Elizabeth Barry, Mrs. Betterton, Anne Bracegirdle and Eleanor Gwyn. It is to be noted also that during the greater part of the 18th century the Dublin stage rivalled the English in the brilliancy of its stars. Betterton's rival Robert Wilks, Garrick's predecessor in the homage he paid to Shakespeare, Charles Macklin and his competitor for favour, the "silver-tongued" Spranger Barry, were able products of the Irish stage, as were Peg Woffington and other well known actresses.

Restoration Drama Heroic Tragedy—Owing in part to the influence of the French theatre, which by this time had taken the place of the Spanish as the ruling drama of Europe, the separation between tragedy and comedy is clearly marked in post-Restoration plays. Lord Orrery, in deference, as he declares, to the expressed tastes of his sovereign King Charles II himself, was the first to set up the standard of heroic plays. This new species of tragedy (for such it professed to be) commended itself by its novel choice of themes, to a large extent supplied by recent French romance—the *romans de longue haleine* of the Scudérys and their contemporaries—and by French plays treating similar themes. It likewise borrowed from France that garb of rhyme which the English drama had so long abandoned, and which now reappeared in the heroic couplet. In conjunction

with his brother-in-law, Sir Robert Howard, and afterward more confidently by himself. John Dryden threw the vigour and brilliancy of his genius into the scale. At first, in his *Essay of Dramatic Poesy*, he claimed for English tragedy the right to combine its native inheritance of freedom with these valuable foreign acquisitions. Nor was he dismayed by the ridicule which the burlesque (by the duke of Buckingham and others) of *The Rehearsal* (1671) cast upon heroic plays, but returned, in his *Essay of Heroic Plays*, to the defense of a species which he himself was to abandon in the end. Among the other tragic poets of this period, Nathaniel Lee, in the outward form of his dramas, accommodated his practice to that of Dryden, like whom he allowed political partisanship to intrude upon the stage. His rhetorical genius was not devoid of genuine energy, nor is he to be regarded as a mere imitator. Thomas Otway, the most gifted tragic poet of the younger generation contemporary with Dryden, inherited something of the spirit of the Elizabethan drama, he had at his command tragic pathos and melting tenderness. Among dramatists who contributed to the vogue of the "heroic" play may be mentioned John Banks, J. Weston, C. Hopkins, E. Cooke, R. Gould, S. Pordage, T. Rymer and Elkanah Settle. The productivity of John Crowne (d. c. 1703) covers part of the earlier period as well as of the later, to which belong Thomas Southerne, a writer gifted with much pathetic power, but probably chiefly indebted for his long lived popularity to his skill in the discovery of "sensational" plots, and Lord Lansdowne ("Granville the polite") (c. 1667-1735). William Congreve, by virtue of a single tragedy (*The Mourning Bride*), and Nicholas Rowe may be further singled out from the list of the tragic dramatists of this period, many of whom were, like their comic contemporaries, mere translators or adapters from the French. The tragedies of Rowe indicate the transition from the fuller declamatory style of Dryden to the calmer and thinner manner of Joseph Addison. The excesses of the past period had produced an inevitable reaction, decorum was asserting its claims on the stage as in society, and French tragedy had set the example of sacrificing what passion—and what vigour—it retained in favour of qualities more acceptable to the "reformed" court of Louis XIV. Addison, in allowing his *Cato* to take its chance upon the stage, when a moment of political excitement (April 1713) ensured to it an extraordinary success, unconsciously sealed the doom of English national tragedy. The "first reasonable English tragedy," as Voltaire called it, had been produced, and the oscillations of the tragic drama of the Restoration were at an end.

Restoration Comedy.—English comedy in this period displayed no similar desire to cut itself off from the native soil and it exhibits the influence of Jonson and Fletcher though it freely borrowed the materials for its plots and many of its figures from Spanish, and afterward more generally from French, originals. The higher efforts of French comedy of character, as well as the refinement of expression in the list of their models, notably in Molière, were alike seasoned to suit the grosser palates of English patrons. This is especially true of the comedies of Dryden, from *The Wild Gallant* (1663) to *The Spanish Friar* (1680). In no field did Dryden's versatile genius appear, on the whole, to less advantage, but in his presentation of pairs of witty lovers he anticipates one of the main features of the comedy of manners, which is the most typical product of the Restoration stage. As a modern historian of that stage (A. Nicoll) observed, "the invariable elements of the comedy of manners are the presence of at least one pair of witty lovers, the woman as emancipated as the man, their dialogue free and graceful, an air of refined cynicism over the whole production, the plot of less consequence than the wit, an absence of crude realism, a total lack of any emotion whatever." There is a further approach to the type in Sir Charles Sedley's *The Mulberry Garden* (1668) and it is definitely established in plays of Sir George Etherege. Other comic types are exemplified in Thomas Shadwell's Jonsonian plays, from the *Sullen Lovers* (1668) to *The Squire of Alsatia* (1688), in Sir S. Tuke's and Mrs. Aphra Behn's comedies of intrigue (1672-79), and in Thomas d'Urfey's partly farcical, partly sentimental plays (1676-96). But it was in the comedy of manners that the most powerful, and the most polished, dramatist of the age found each

his medium. William Wycherley drew his characters with vigour and distinctness, and constructed his plots and chose his language with natural ease. He lacks gaiety of spirit, and his wit is of a cynical turn. But, while he ruthlessly uncloaks the vices of his age, his own moral tone is affected by their influence in as marked a degree as that of the most light-hearted of his contemporaries. Congreve is not only one of the wittiest of English writers, but excels in the graceful ease of his dialogue, and draws his characters with the same masterly skill. His *Way of the World* has been truly called "the master creation of the school of manners." Mirabell and Millamant look back to Benedick and Beatrice and forward to Tanner and Ann Whitfield in George Bernard Shaw's *Man and Superman*. Sir J. Vanbrugh lacked Congreve's brilliance, but his lively wit and theatrical sense gave salt to his two best plays, *The Relapse* and *The Provok'd Wife*. G. Farquhar, whose morality is on a par with that of the other members of this group, is inferior to them in brilliancy, but the pictures of manners, in a wider sphere of life than that which contemporary comedy usually chose to illustrate, give distinction to two of his plays (*The Recruiting Officer* and *The Beaux' Stratagem*), in which we seem to be entering the atmosphere of the 18th-century novel.

Sentimental Comedy.—The improvement which now begins to manifest itself in the moral tone and spirit of English comedy is partly due to the reaction against the reaction of the Restoration, partly to the punishment which the excesses of the comic stage had brought upon it in the invective of Jeremy Collier (1698), best founded of all the assaults on the theatre in England and most productive of perceptible results. Writers like Susanna Centlivre became anxious to reclaim their offenders with much emphasis in the fifth act, and Colley Cibber may be credited with having first deliberately made the pathetic treatment of a moral sentiment the basis of the action of a comic drama. But he cannot be said to have consistently pursued the vein which in his *Careless Husband* (1704) he had essayed. His *Non-Juror* is a political adaptation of *Tartuffe*, and his *Provoked Husband* only supplied a happy ending to Vanbrugh's unfinished play. Sir Richard Steele, in accordance with his general tendencies as a writer, pursued a still more definite moral purpose in his comedies, but his genius lacked the sustained vigour necessary for a dramatist, and his humour naturally sought the aid of pathos. From partial he passed to more complete experiment, and thus these two writers, who transplanted to the comic stage a tendency toward the treatment of domestic themes noticeable in such writers of Restoration tragedy as Southerne and Rowe, set the fashion of sentimental comedy, a species which exercised a debilitating influence upon the progress of English drama. With *Cato* English tragedy committed suicide, though its pale ghost survived, with *The Conscious Lovers* English comedy sank for long into the tearful embraces of artificiality and weakness.

There is every reason to conclude that the art of acting progressed in the same direction of artificiality, and became stereotyped in forms corresponding to the "chant" which represented tragic declamation in a series of actors ending with James Quin and Charles Macklin.

It was reserved to the genius of Garrick, whose theatrical career extended from 1741 to 1776, to open a new era in his art. His unparalleled success was due in the first instance to his natural gifts, yet these were enhanced by a careful literary training, and confirmed by a purpose which prompted him to essay the noblest, as he was capable of performing the most various, range of English theatrical characters. By devoting himself as actor and manager with special zeal to the production of Shakespeare, Garrick permanently popularized on the national stage the greatest creations of English drama.

Eighteenth Century Tragedy.—The contrast between the tragedy of the 18th century and those plays of Shakespeare and other Elizabethans which in the period before Garrick were known to the English stage was weakened by the mutilated form in which the old masterpieces generally, if not always, made their appearance there. Even so, however, there are perhaps few instances in theatrical history of so unequal a competition being

so long sustained. In the hands of the tragic poets of the age of Pope, as well as that of Johnson, tragedy had hopelessly stiffened into the forms of its accepted French models. Direct reproductions of these continued, as in Ambrose Philips' and Charles Johnson's (1679-1748) translations from Racine, and Aaron Hill's from Voltaire. Among other tragic dramatists of the earlier part of the century may be mentioned John Hughes, who, after assisting Addison in his *Cato*, produced at least one praiseworthy tragedy of his own (*The Siege of Damascus*), Elijah Fenton, a joint translator of "Pope's Homer," and the author of one extremely successful drama on a theme of enduring interest (*Marianna*), and Lewis Theobald the first hero of the *Dunciad*. A more distinguished name is that of James Thomson, whose unlucky *Sophonisba* and subsequent tragedies are, however, barely remembered by the side of his poems. The literary genius of Edward Young, on the other hand, possessed vigour and variety enough to distinguish his tragedies from the ordinary level of Augustan plays, in one of them (*The Revenge*) he seems to challenge comparison in the treatment of his theme with *Othello*, but by his main characteristics as a dramatist he belongs to the school of his contemporaries. The endeavours of George Lillo, in his *London Merchant*, or *George Barnwell* (1731), to bring the tragic lessons of terror and pity directly home to his fellow citizens exercised an astonishingly widespread as well as enduring effect on the history of the 18th century drama. At home, they gave birth to the new, or, more properly speaking, the revived, species of domestic tragedy. Abroad, this play supplied the text to the teachings of Diderot, as well as an example to his own dramatic attempts, and through Diderot the impulse communicated itself to Goethe and Lessing, and long exercised a great effect upon the literature of the German stage. "Classical" tragedy in the generation of Johnson pursued the even tenor of its way, the dictator himself treading with solemn footfall in the accustomed path and W. Mason making the futile attempt to produce a close imitation of Greek models. The best-remembered tragedy of the century, John Home's *Douglas* (1757), was the production of an author whose famous kinsman, David Hume (though no friend of the contemporary English stage), had advised him "to read Shakespeare, but to get Racine and Voltaire by heart."

English Opera—While thus no high creative talent arose to revive the poetic genius of English tragedy, comedy, which had to contend against the same rivals, naturally met the demands of the conflict with greater buoyancy. In one form the English opera was preserved as a pleasing species of the popular drama. The pastoral drama had (in 1725) produced an isolated aftergrowth in Allan Ramsay's *Gentle Shepherd*, which, with genuine freshness and humour but without a trace of burlesque, transferred to the scenery of the Pentland hills the tale of Florizel and Perdita. The dramatic form of this poem is only an accident, but it doubtless suggested an experiment of a different kind to the most playful of London wits. John Gay's "Newgate pastoral" of *The Beggar's Opera* (1728), in which the text of a burlesque farce was interspersed with songs set to popular airs, caught the fancy of the town and became the ancestor of a series of productions, none of which, however, not even its own continuation, *Polly*, have ever rivalled it in success or celebrity. Among these may be mentioned the pieces of H. Carey, T. Holcroft, C. Coffey, I. Bickerstaffe and C. and J. T. Dibdin. The opera in England thus absorbed what vitality remained to the pastoral drama, while to the ballet and the pantomime (whose glories in England began at Covent garden in 1733, and to whose popularity even Garrick was obliged to defer) was left the inheritance of the external attractions of the masque and the pageant.

Later 18th-Century Comedy—In the face of such various rivalries it is not strange that comedy, instead of adhering to the narrow path which Steele and others had marked out for her, should have permitted herself some vagaries of her own. Gay's example pointed the way to a fatally facile form of the comic art, and burlesque began to contribute its influence to the decline of comedy. In an age when party government was severely straining the capabilities of its system, dramatic satire had not far to look for a source of effective seasonings. The

audacity of H. Fielding, whose regular comedies have secured no enduring place on the stage, accordingly ventured in two extravaganzas (*Pasquin* and *The Historical Register* for 1736) upon a larger admixture of political with literary and other satire. A third attempt (*The Golden Rump*), which never reached the stage, furnished the offended minister, Sir Robert Walpole, with the desired occasion for placing a curb upon the licence of the theatre, such as had already been advocated by a representative of its old civic adversaries. The act of 1737 asserted no new principle, but converted into legal power the customary authority hitherto exercised by the lord chamberlain (to whom it had descended from the master of the revels).

Farce had now become a genuine English species, and has as such retained its vitality through all the subsequent fortunes of the stage, it was actively cultivated by Garrick as both actor and author, and he undoubtedly had more than a hand in the best farce of this age, which is ascribed to clerical authorship (*High Life below Stairs*, 1759). S. Foote, whose comedies and farces are distinguished both by wit and by variety of characters, introduced into comic acting the abuse of personal mimicry. Meanwhile, the domestic drama of the sentimental kind achieved, though not immediately, a success only inferior to that of *The London Merchant*, in *The Gamester* of E. Moore, to which Garrick seems to have contributed, and sentimental comedy gained sympathetic applause in the works of R. Cumberland, F. Reynolds and H. Kelly. It cannot be said that this species was extinguished, as it is sometimes assumed to have been, by Goldsmith, but he certainly published a direct protest against it between the production of his admirable character comedy *The Good-Natured Man*, and his delightfully brisk and fresh *She Stoops to Conquer*. The most successful efforts of the elder G. Colman had in them something of the spirit of genuine comedy, besides a finish which is one of the qualities which ensure a long life to a play. And in the masterpieces of Richard Brinsley Sheridan some of the happiest features of the comedy of Congreve were revived, together with its too uniform brilliancy of dialogue, but without its indecency of tone. The varnish of the age is indeed upon the style, and the hollowness of its morality in much of the sentiment (even where that sentiment is meant for the audience) of *The Rivals* and *The School for Scandal*, but in tact of construction, in finish of character drawing and in pungency of social satire they are to be ranked among the glories of English comedy. Their continued popularity has in fact unduly overshadowed the merits of other later 18th century plays. T. Morton's *Speed the Plough* (where we first hear of "Mrs Grundy"), A. Murphy's *The Way to Keep Him* and *The School for Guardians*, and the humanitarian drama of T. Holcroft (*The Road to Ruin* and *The Deserted Daughter*) and Elizabeth Inchbald (*Every One Has His Faults* and *Wives as They Were and Maids as They Are*) all have distinctive qualities. Notable too are Hannah Cowley ("Anna Matilda") and G. Colman the younger, both writers of popular comedies, as well as the prolific J. O'Keefe (1746-1833), who contributed to nearly every species of the comic drama.

19th Century Drama—With the beginning of the 19th century came a decline of dramatic composition of the higher class. Joanna Baillie's well meant but anæmic attempts to rejuvenate poetic tragedy and comedy in her plays on the passions were based on a misleading theory. In any case the times were out of joint for such an endeavour. The poems, with which Scott and Byron, and the novels, with which Scott both satisfied and stimulated the imaginative demands of the public, diverted the attention of the cultivated classes from dramatic literature, which was unable to escape, with the light foot of verse or prose fiction, into "the new, the romantic land." Scott, who in his earlier days had translated Goethe's *Götz von Berlichingen*, gained no reputation by his own dramatic compositions. W. S. Landon, apart from those *Imaginary Conversations* upon which he best loved to expend his powers of observation and characterization, cast in a formally dramatic mould studies of character of which the value is far from being confined to their wealth in beauties of detail. Of these the magnificent, but in construction altogether undramatic, *Count Julian* is the most noteworthy. Shelley's

The Cenci, on the other hand, is not only a poem of great beauty, but a drama of true power, abnormal in theme but singularly pure and delicate in treatment. A humbler niche in the temple of dramatic literature belongs to some of the plays of C R Matunn, Sir T N Talfourd and Dean Milman.

Never was the divorce between the theatre and literature so complete and prolonged as during the major part of the 19th century. Fertilizing ideas, distinction of style, whether in poetry or prose, and originality in technique were all wanting. Among the professional playwrights only a few have a claim to remembrance. Sheridan Knowles composed his conventional sentiment of genuine tragedy and comedy (*Virginius* and *The Hunchback*) with a thorough knowledge of stage effect. The first Lord Lytton, though his plays were for the most part of a lighter texture, showed even more artificiality of sentiment in their conception and execution, but the romantic touch which he imparted to the *Lady of Lyons* accounts for its long-lived popularity. T W Robertson in *Society* (1865) followed by *School and Castle* brought back a refreshing breath of naturalness into comic drama, Tom Taylor made little pretense to original invention, but adapted with an instinct that rarely failed him.

In the last decades of the Victorian age, the revival of public interest in the theatre co-operated with a gradual change in poetic taste to awaken the hope of a future living reunion. Among English poets who lived in this period, Sir Henry Taylor and R H Horne caught something of the Elizabethan accent and spirit. Of the chief poets of the age, Tennyson in his later years attempted, with partial success, a form of composition not fully suited to his genius (though his *Becket*, as interpreted by Irving, was a memorable stage ecclesiastic). Memorable also are the plays of Robert Browning (especially *Strafford*), some of whose distinctive gifts are displayed in his dramatic work, and the sustained endeavours of A C Swinburne, after adding *Atlanta in Calydon* to the wreath which the lovers of the Attic muse have laid at her feet, to enrich the national historic drama by a trilogy on the fortunes of Mary queen of Scots.

(London, 1888); W C Hazlitt, *A View of the English Stage* (London, 1818); A Nicoll, *A History of Late Eighteenth Century Drama, 1750-1800* (1927); *A History of Early Nineteenth Century Drama, 1800-1850*, 2 vol. (1930); *A History of Late Nineteenth Century Drama, 1850-1900*, 2 vol. (1947). (A W WA, F S B)

The Theatre of Charles Kean and Samuel Phelps—During the greater part of the 19th century the English drama was more fitly to be considered as a part of the general industry of entertainment than as a serious contribution to the world's art of the theatre. When Matthew Arnold protested in 1879 that there was no English theatre he did not, of course, mean that there were no stages, no actors and no audiences, but that England was not taking a considerable or a worthy part in the development of a dramatic form of expression which had other ambitions than mere showmanship and the establishment of box office standards of success. The English drama did, in fact, conform to its position in the industry of catering for the popular leisure by expanding with expanding commerce. It even followed the economic trend so closely that it acquired free trade at the time when free trade was becoming a dominant social issue. The lingering and rather futile efforts to protect the economic interests of the two historic patent theatres of London, Drury lane and Covent garden, by giving them a monopoly of the legitimate drama were abandoned in 1843, when an act of parliament granted a comprehensive freedom to the stage. Drama was thus liberated like any article of commerce and, as the population was growing rapidly in numbers and in wealth, there was a swift expansion of dramatic output. But what was offered to the new public must, unfortunately, be considered in terms of quantity rather than of quality. Commercial standards became more frankly accepted and the ideal of the "long run" supplanted the old conceptions of a classical repertory in which it was the function of the leading players to appear continually and to display their various powers and graces in a great variety of traditional and testing parts. The old policy, however, of a classical routine, was maintained by Charles Kean who became lessee of the Princess's in 1850 and by Samuel Phelps at Sadler's Wells. Kean, on the one hand, was endeavouring to sustain the best kind of dramatic appeal by throwing in costly embellishments which a later taste would have considered unnecessary or even absurd. Phelps, on the other, did splendid work, not only for the public that still wanted Shakespeare, but for the Shakespearean text itself, by going back to the folio for his matter instead of using the adaptations and "versions" which had been started during the Restoration with the authority of Dryden and had continued to grow in numbers and stupidity throughout the 18th century. Even John Philip Kemble, who had been considered something of a purist in these matters, played a musical version of *The Tempest* which contains lyrics in the style of an 18th century ballad opera. Against such barbarism, long taken for granted even by cultured people, Phelps made a strong and splendid stand at Sadler's Wells and during his management there, which lasted from 1844 till 1862, he maintained a dignified level of dramatic art while the national theatre as a whole was concerned only with rhetoric and sensation and with reaping the financial benefits of its new freedom.

After the act of 1843 there was a rapid growth of theatres proper or lord chamberlain's houses, they could multiply according to popular demand while the old saloon theatres, which had

been outside the patent and had dealt mainly in imported romantic dramas and light operas, found that the new rivalry necessitated new measures. The saloon theatres accordingly relied more and more upon song and dance and became the parents of the music hall, while the orthodox houses were occupied by all that early Victorian England could offer in the shape of drama. It was not very much. Right on up to the '80s the Victorian theatre was dominated by the French tradition in farce and melodrama, with the result that many English writers, who might have been the "abstracts and brief chronicles" of their time, or who might at least have given to the actors opportunities for fulfilling the high function ascribed by Hamlet to the players, remained mere hacks engaged in adapting imported material.

T W Robertson's Comedies—A distinct change was made by T W Robertson (1829-71), whose comedies seem to the present-day reader to be painfully stilted and artificial. Robertson, none the less, was the supposed rebel and realist of his times, he believed that he was bringing the drama back to life from the pretty Alsatias and the notorious nonsense worlds to which it had been driven. He became dramatist to the Bancroft management at the Prince of Wales's theatre where a new school of realistic staging and acting was begun in self-conscious revolt against the tawdry romanticism, the pomposities of rhetoric and spectacle and the wild fustian of the general drama of the time. Robertson's most important contribution to the theatre of that period was his refusal to accept the battered types which passed for figures of fun. To playwrights 50 years later *Society* (1865) and *Caste* (1867) seemed almost laughably artificial, but they were considered by contemporary critics to be daring essays in naturalism and actuality. Before Robertson's time the writing and the acting of character parts were limited by certain acknowledged formulas. There was a routine of the ridiculous in the theatre, as there was afterward in the music halls where noses had to be red by regulation and umbrellas broken as it were by schedule. Squire and Effie Bancroft, working on Robertson's pieces, abolished these traditional restrictions upon truth and tried to substitute fresh individual characters for the stale humours of the type. The whole policy was to let the breeze of actuality into the hot, stale atmosphere of the playhouse, and in this invigorating change they had important allies in two actors of consequence, E A. Sothern and John Hare. The latter wrote of Robertson that "As nature was the basis of his work, so he sought to make actors understand that it should be of theirs. He thus founded a school of natural acting which completely revolutionized the then existing method and, by so doing, did incalculable good to the stage." Unfortunately Robertson lacked successors. James Albery was credited with imagination and wit but he found the way of the adapter easier than that of the creator, and H J Byron altogether fell away from the standards which Robertson had endeavoured to institute. Adaptations went briskly on and it was significant that when Beerholm Tree went into management at the Haymarket in 1887 he relied mainly upon plays of foreign origin. Until the '80s were well advanced the practice of adaptation from the French (and sometimes, as in the case of the ever-popular farce *The Private Secretary*, from the German) was held to be legitimate as well as the customary occupation of a British playwright. To create episode or character was a rarity. Among those who occasionally created and more often adapted were W S Gilbert and Tom Taylor.

The New Theatre—But, while the mid-Victorian years were largely sterile in authorship, important changes were being made in the organization and social status of the English theatre. In early Victorian times the actor was usually expected to be a Bohemian and might even be an outcast. The playhouse itself might be rough and ready and the society to be met there little better. The Bancrofts were responsible not only for freshening the quality of stage writing and production, but for reintroducing the theatre to the attention of the prosperous middle class and of those who might previously have hesitated before being seen in such a place. The Bancrofts may not have found this polite and cultivated society of playgoers which Meredith postulated as essential to the production of comedy, but they rendered admirable

service to the drama by restoring it to its place among the exercises and adornments of a civilized community.

Another of their achievements was the reorganization of theatrical life throughout the country. Provincial production had hitherto been left to stock companies or to travelling troupes working on local circuits. The national development of communications made travel far easier than it had been and it was possible to carry proper scenery from place to place instead of relying upon the accident of local provision. In 1867 Bancroft organized for tour an exact reproduction of the London presentation of *Caste* and the quality of the performance appears to have been greatly appreciated in the towns which were visited. Buckstone's company from the Haymarket followed suit and it soon became common for actor managers to go on tour and so bring to the various towns a smoothness and a virtuosity of performance to which the local audiences were quite unused. By the end of the 19th century all the great London actors and important foreign visitors, like Sarah Bernhardt, habitually took their companies on tour and the centralization of theatrical activity in the capital was considerably diminished.

The Stage Divorced from National Culture—It is plain from what has been said of the early and mid-Victorian stage that the play was not the thing. The playgoer's motive was rarely literary nor did he regard it as the function of the dramatic art to hold the mirror up either to human nature, to current manners or to problems of the hour or of eternity. The period was one of intensely dramatic changes in the national life. The whole economic structure of society was altering, science was coming forward to challenge dogma, the strife of classes and of generations was taking shape in conflicts whose natural artistic expression should surely have been dramatic. But to the student who wishes to map out the social landscape of the time the stage offers extremely little evidence. In no sense were the actors the abstracts of their time. Both the pride in the new progress and the protests against it were made vocal in the novel and in poetry. Unfortunately the English stage was so far divorced from the national culture that it totally failed to interpret in terms of drama the immensely important and immensely exciting developments in the knowledge, wealth and power of mankind. If ever history was throwing material to the playwright it was then, but the playwright was too busy with importing French trivialities or concocting the farces of the routine to pay any attention to his superb opportunities of doing for the theatre what Dickens and Thackeray were doing for the novel. It was only after Ibsen had revolutionized the European theatre by making his drama into a vivid criticism of actual social values that English writers who had a similar artistic purpose came to use the dramatic medium.

An Actor's Theatre—But in the absence of a great school of playwrights there was both demand and supply of great acting. There are always three parties to the act of the theatre. There is the man who writes, the man who acts and the man who makes the spectacle. That is a simple analysis which is capable of much refinement in one way or expansion in another. The history of the theatre shows that those three parties are continually engaged in rivalry as well as in co-operation. A struggle for the balance of power is ever in progress. Accordingly, whereas one epoch or generation is particularly distinguished for the quality of its plays and of its authors, when it attracts to theatrical service, another is the golden age of the great actor who is admired for himself alone and not in relation to the splendour or the subtlety of that in which he acts, while at another time the emphasis centres on display of scene or on the mass effects controlled by the producer and the pregnant master. The theatre of England in the 19th century (or at least until the renaissance of English dramatic composition in the '80s) was predominantly an actor's theatre. Pageantry there might be, personality there had to be. The playgoer thought in terms of the actor and his individual magnetism.

The Reign of Henry Irving—The sovereignty of Henry Irving in the theatre of the time can best be understood if we remember to what extent that theatre was under the actor's

domination Irving carried on the social service of the Bancrofts in bringing honour to his art and rescuing his profession from squalor and from disrepute. Yet of this most eminent Victorian, whose name is almost synonymous with the national theatre of his time, an otherwise sympathetic critic could remark, "His managerial career had scarcely any significance for the living English drama. He seldom experimented with a new play, and, of the few which he did produce, only *The Cup* and *Becket* by Lord Tennyson have the remotest chance of being remembered." And even these were soon forgotten. But the man was not. To see *The Bells*, an adaptation from the French of Erckmann-Chatrian, without Irving was to see an ordinary melodrama which might in later years have formed part of a Grand Guignol program. But Irving's emotional powers enabled him to turn "tushery" into tragedy, he could strike terror, though he some times failed to raise compassion, with the result that his melodramatic villains were more successful than his tragic heroes. His reign at the Lyceum (1878-99), in which for so long he had Ellen Terry as his colleague in command, was a sustained and, on the whole, successful demonstration of the benefits that may lie in an actor's dominion over the dramatic art. His Richard III, Iago and Shylock were commonly accepted as brilliant and he could raise a melodrama like *The Lyons Mail* from its natural level of efficient artifice to the higher category of the tragedian's art. There will always be different delights of the theatre and it is a far distinction which separates the drab talents from the flamboyant. By drab one seeks, without slight, to denote the quiet pleasures of logic, the whisper of realism and the pussance of that art which is, on the surface, no more than a hint. The Victorian theatre was the home of the rhetoricians and the flamboyants, and Irving, who went into battle nightly with all his drums beating, was at once the sovereign and the symbol of his time.

Melodrama—This cult of flamboyance had naturally its various levels. One aspect was the popularity of translations of V. Sardou, a French playwright who exploited situation with exceptional cunning. His play *Dora*, first produced in English as *Diplomacy* at the Prince of Wales's in 1878 and later frequently revived in London and elsewhere, is a perfect example of the well-made play built to frame highly coloured acting. Lower down the scale there was a steady flow of melodrama, and Henry Arthur Jones, afterward to be a considerable master of the comedy of manners, won an early success with *The Silver King*, which was produced at the Princess's in 1882 and showed a technical adroitness later to be expended on less crude material. In this genre Wilson Barrett was a great performer, George R. Sims a competent and fluent librettist and the Adelphi theatre a constant home of flamboyant spectacle and unabashed sensationalism. At Drury lane the famous Christmas pantomimes with their vast display and costly transformation scenes were followed by equally resplendent dramas and the management of Sir Augustus Harris (1879-96) provided many popular triumphs in this type of work. Arthur Collins, who later carried on and developed the tradition of Drury lane, was no less successful. Melodrama in its crudest form had great difficulty in surviving the competition of the films, but it stayed on obstinately at the Elephant and Castle theatre in south London and there was a large middle class audience which made pilgrimages to see and to titter at such flamboyant folk plays as *Maria Marten* and *Sweeney Todd*.

The mid-Victorian musical stage was in subjection to the Offenbach tradition. That might have meant delightful entertainments, but the adaptations were badly made and now seem pitifully inane. Another form of entertainment was the burlesque which was initiated by J. R. Planché and well developed by the founder's hand, but it was grossly abused by less competent people and the fact that the lamp might shine brightly at the Gaiety did not guarantee a parallel radiance elsewhere. The great mid-Victorian contribution to light opera and the musical theatre in general was the partnership of W. S. Gilbert with Arthur Sullivan. The brief extravaganza *Iolanthe* (1882) was followed by a long series of operettas, gently satirical and exquisitely melodious, of which *Patience*, a brilliant lampoon of the aesthetic movement, was perhaps the clearest, when *The Mikado* and

The Yeomen of the Guard remained the most popular. Though the two great co-operators were frequently at odds with one another they did their best work in association and the Richard D'Oyly Carte management at the Savoy theatre from 1881 on ward enjoyed a constant, a wide and a discriminating support. Meanwhile burlesques fell out of favour and were displaced by "musical comedy" of which the first example was *In Town*, produced in 1892. It, in turn, found a new rival in "revue," a form of song and dance show interspersed with skits and sketches.

H. A. Jones and A. W. Pinero—The orientation of theatrical effort toward great feats of acting and displays of personal magnetism continued until the end of the century. The visits to England of Eleonora Duse and Sarah Bernhardt and the emergence of an English actress of great power and individuality in Mrs. Patrick Campbell created an intense and stimulating rivalry and a triangular tournament of talent. In June 1895 Bernard Shaw, then critic of the *Saturday Review*, wrote, "We critics can at last outdo Hazlitt and Leigh Hunt if we have a mind to, for we have just had two Mrs. Ebbsmiths to compare, beside a fourth Fedora, and Duse and Bernhardt playing *La Dame aux Camélias* and Sudermann's *Hemai* against one another at Daly's theatre and at Drury Lane." At the same time, however, the author was recovering his position in the English theatre and a distinct renaissance of the playwright's art began to be noticeable in the '80s. Henry Arthur Jones graduated from emotional drama to write urbane comedy such as *The Lure* (1897), or deft plays of situation such as *Mrs. Dune's Defence* (1900), while A. W. Pinero, beginning (1885-87) as a farceur with three very promising pieces, *The Magistrate*, *The Schoolmistress* and *Dandy Dick*, passed on by way of sentimental comedy (*Sweet Lavender*) to become a master of drawing room drama and England's most important manipulator of the fashionable problem piece. After composing some pieces of improving quality he wrote *The Second Mrs. Tanqueray*, which was produced at the St. James's theatre in 1893 and caused an immediate sensation. Undoubtedly the power and the expertness of this drama presented Pinero with a reputation which was European as well as English. Mrs. Tanqueray's story was followed by a rapid succession of pieces which kept the dramatist in perpetual discussion and made attendance at his work an essential pleasure for the educated members of London society. *Trelawney of the Wells* was one of his most popular comedies, while *The Gay Lord Quex*, *Iris*, *Letty* and *His House in Order* revealed the many facets of his industry and his technical competence. Meanwhile the successes of Pinero and Jones were calling the notice of managers and actor-managers to the possibilities of using the fresh work of English authors instead of relying, as of old, upon a flow of adaptations. Hence it was that Sydney Grundy, R. C. Carton, Haddon Chambers and others found their opportunities and took them. The partnership of Jones's writing with Charles Wyndham's acting was a notable feature of the '90s. Carton turned out a very capable sequence of light comedies in which his wife, who acted as Miss Compton, was a constant and all conquering performer. *Lady Huntworth's Experiment* and *Mr. Hopkinson* were typical of his light invention.

A new generation of playwrights began to appear. The theatre had recovered its esteem and men of letters need no longer hesitate to contribute to it lest their work should be touched by vulgarity of performance or despised because of the house in which it was lodged. Oscar Wilde, for instance, turned to the theatre in 1892 and brought to the art of comedy his extraordinary brilliance in artificial dialogue. His mastery of epigram and paradox may seem a brittle talent, but it carried distinction of style into a region from which style had long been absent. Between 1892 and 1895 Wilde wrote *Lady Windermere's Fan*, *A Woman of No Importance*, *An Ideal Husband* and, most durable of all, *The Importance of Being Earnest*. Between 1902 and 1908 J. M. Barrie, a journalist turned novelist and then dramatist, gave to the stage *Quality Street*, *The Admirable Crichton*, *Little Mary*, *Peter Pan*, *Alice Sit by the Fire* and *What Every Woman Knows*. Among other names that must be mentioned as valuable servants of the stage at that period are those of H. V. Esmond, Albert Sutro and Hubert Henry Davies.

Ibsen's Influence.—At this point it is necessary to turn back and to trace as briefly as possible the external forces which were helping to recreate the English drama after the long inertia of the 19th century. Henrik Ibsen's influence had begun to penetrate Europe in 1875 and for the next 20 years his steady output of plays, in which the driving actuality of a realistic method was applied to a social criticism and a radical philosophy of personal independence, made him a pre-eminent figure in any centre where the stage was considered as something more than a pastime and a plaything. When the rebellious wife, Nora, banged the door of *A Doll's House* (1880), the echo of that violence was heard across the continent, and the bitter criticisms of respectability which followed in *Ghosts* started a battle of the critics and a storm of discussion wherever that play was produced.

As Ibsenism gathered force there were sporadic but simultaneous movements in the great capitals with the common goal of a new theatrical art freed from the old bondage of routine entertainment, from the rhetoric and the rant of the old acting, and from the frumpiness of the old method of presentation. The new drama was to be expressive of the social needs and purposes of the time. André Antoine, a gas works clerk who began his theatrical experiments in a garret to which he pushed his properties in a handcart, founded the Théâtre Libre in Paris in 1887 and transferred to the stage the naturalism which had replaced romanticism in the French fiction of his time. He strove to develop a drama which should mirror the pains, pleasures and problems of the day and a style of acting which should be quietly harmonized with the new method of writing. The revolt spread rapidly and "free theatres" were founded in the various capitals and, in turn, gave rise to other small, independent playhouses with such titles as the Modern Theatre or the Art Theatre. The famous Moscow Art Theatre was founded in 1895 as a practical protest against the fusion of alien origin and the eternal traffic in stale French trifles which obstructed all progress on the Russian stage. The idea of the founders, V. Nemirovitch-Danchenko and Stanislavsky, was to elicit in terms of what they called "spiritual realism" a native Russian drama which should be representative of the younger generation, of its criticism of life and of its aspirations and its resolves. "In our destructive and revolutionary aims," wrote Stanislavsky, "in order to rejuvenate the art we declared war on all the conventionalities of the theatre wherever they might occur—in the acting, the properties, the scenery, or the interpretation of the play." As a result the author Anton Chekhov, who had been on the verge of a suicidal despair, was able to do his work in sympathetic company and comparative cheerfulness and so to achieve his loveliest self-expression before he died. The new theatres, in short, were fostering new dramatists who, in turn, were fostering a new modesty and veracity in the players for whom they provided truthful and subtle dialogue and situations sincerely contrived instead of the familiar clichés of theatrical word and melodramatic deed.

The Arrival of Bernard Shaw.—The English parallel of the various free theatres was called the Independent by its founder J. T. Grein and was opened in 1891 with a performance of *Ghosts*. To begin with its directors were naturally attracted by translations of the new and important foreign work. The Independent gave Ibsen and Zola. But in the winter of 1892 it found its mission in *Man and Superman* by George Bernard Shaw who produced and met with no particular enthusiasm. But a new master had broken into the theatrical world and one who was claimed by many to be the greatest English dramatist since Shakespeare began to compose regularly for the stage. The theatre viewed as a section of the industry of entertainment, may have begun by rejecting his mission as it had rejected the aim of Ibsen and the Ibsenites. But the art of the drama was not to be kept for ever in complete subjection to the commercial machine. The new drama had to live from hand to mouth by subscription performances on Sunday nights by special matinees and by the efforts of amateurs. But it lived audaciously and obstinately and so established its independence. The Stage Society was founded in 1900 to produce on Sunday evenings the plays of merit and of experiment which could not find a home inside the ordinary playhouse, and there were many subsequent organizations of a similar type and

a similar object. The Stage Society discovered H. G. Granville Barker as author and producer and it was the Vedrenne-Barker partnership at the Court Theatre (1904-07) which won for the first time a considerable English public and a wide recognition for Bernard Shaw. The Court became a practical academy for young actors in search of experience and an outlet for the new author who were using the method of Ibsen to record their affirmations about every aspect of life. The chief Shaw successes at the Court were *You Never Can Tell*, *Man and Superman*, in which Granville Barker gave a particularly brilliant performance of the chief part *John Bull's Other Island*, *Major Barbara* and *The Doctor Dilemma*. Another outstanding production was that of *The Silver Box*, which introduced John Galsworthy to the playgoing public and Gilbert Murray's translations of Euripides were also among the novel features of the Court program. St. John Hank (1869-1909) was a new dramatist to whom the commercial theatre was not usually hospitable. The Court season gave him new opportunities, while Granville-Barker's own play *The Voyage I Heritance* was staged under the inspiring direction of the author.

The "Literary" Drama.—From this it may be seen that remarkable and valuable change had come to the English theatre. The sovereignty of the actor and the actor manager did not pass away because a few challenging trumpets had been blown outside the walls of the commercial theatre. Sir Herbert Beerboom Tree continued at His Majesty's theatre to blend poets with pageantry and both with personality. Stephen Phillips, poet whose reputation stood astonishingly high in his time but was doomed to an almost complete eclipse after his death, composed *Ulysses* (1902) and *Nero* (1906) for Tree, who also employed Comyns Carr and Louis N. Parker as dramatists; perhaps it would be fair to say as librettists for his grand essays in stagecraft and mass production. Tree's Shakespearean ventures were launched upon a full spread of scenic canvas and he himself was an actor of resource with a rich technique for the elaborate character parts. But outside and beyond the splendours of His Majesty's, with its tonnage and poundage of panoramic effects, its occasional droves of livestock and its constant largesse of the incidentals and accessories of drama, the new English voice was making itself heard. It was often quiet and argumentative in distinction to the rhetoric and the colour of conventional work but it became attractive to the young men and women who flocked to the theatre a mode of expression which would never have been contemplated by their fathers. There had, of course, been Victorian "literary" drama. All Tennyson's verse plays were acted (*Harold*, long neglected, was given in London in 1928 while Swinburne's large output of tragedy was strangely underrated despite his lack of concentration he had some sense of the theatre as well as a superb fluency, and his trilogy on Marston of Scots might yet survive if carefully prepared for the stage. Most poets of the period composed occasionally in dramatic form. Robert Bridges wrote *Prometheus* (1883) and *Nero* (1885) while John Davidson poured his wild fancy, anger and despair into a series of published plays. Thomas Hardy also presented his gigantic study of the Napoleonic wars in three volumes of acts and scenes. *The Dynasts*, with its cosmic sweep and philosophic chants as well as its routs and triumphs of embattled hosts, might seem to be beyond the compass of an stage but Granville Barker produced an action which was

Repertory Theatres.—The Vedrenne-Barker season at the Court was the prelude to the revival of the English stock-company system with a heightened ambition. The new movement abandoned the name of "stock" for that of "repertory" and it was to the new repertory theatres that the men of letters and the

young dramatists eagerly turned for their opportunities. Shaw had already revealed an example of how inclusive the kingdom of drama might become. The new dramatists were not only to abandon the old theatricalism with its tedious repetition of plots in which farcical misunderstandings or sexual intrigues were almost the only constituents, they were to shrink from nothing in politics or economics, in ethics or metaphysics. They were to resume the Ibsenite tradition and make the English theatre an informed critic and mouthpiece of its age with the actor no longer domineering in all the richness of a star part and exhibiting a star personality but co-operating with the dramatist as an abstract and brief chronicle of the time.

At the Court theatre in London the example had been set, it was in the provinces, however, that the distinctive "repertory" movement was established. The absence of any national or municipal endowments for the theatre meant that the necessary funds for the creation of theatres which could hardly be (and were not intended to be) serious competitors in the industry of entertainment had to be found among private patrons of the arts and enthusiasts for dramatic enterprise. Alfred Wareing, a young touring manager fired by a great enthusiasm for the new drama, was enabled by some men of civic spirit in Glasgow to take over the Royalty theatre as a citizens' playhouse and there he maintained an ambitious repertory for several years. Annie E. F. Horniman, who had been private secretary to W. B. Yeats and had backed the production of Shaw's *Arms and the Man* at the Avenue theatre in 1894, opened the Abbey theatre in Dublin ten years later. The rise of this theatre was a natural part of the Irish literary renaissance which came in with the 20th century. It was due partly to the earlier experiments of George Moore and Edward Martyn, and partly to the reaction upon Irish intellectuals of the general wave of artistic endeavour in the theatre. The governing influence fell in the end to W. B. Yeats and Lady Gregory, both dramatists, and it was under their influence that the genius of J. M. Synge, an invalid who died before he was 40, found expression with *Riders to the Sea*, *The Well of the Saints* and *The Playboy of the Western World*. Other writers of distinction connected with this theatre were Lennox Robinson and St. John Ervine, and in 1922 a Dublin plasterer named Sean O'Casey made his reputation there with *The Shadow of a Gunman*. The Abbey Theatre company at this time had a wide and well earned fame, and while the broad humours of Arthur Sinclair, their early beauty and maturing powers of Sara Allgood and Maude O'Neill may be selected for particular praise, the team as a whole had a common quality that made their visits to England an exceptional pleasure to connoisseurs of acting.

In 1907 Miss Horniman purchased the Gaiety theatre in Manchester and ran it until 1921, when it was sold to a motion-picture syndicate. The great period of the Gaiety was in the years between 1908 and 1914, during which time it attracted the widespread attention of critics and authors, enlisted the services of young players and producers who were afterward to become leaders of the English theatre and gave the name of "Manchester school" to a particular kind of play and type of presentation in which quaintness and sincerity were familiar characteristics. Among the authors who found fine opportunities at the Gaiety were Allan Monkhouse, John Masefield, Stanley Houghton and St. John Ervine, while the works of established playwrights of the new school like Shaw and Galsworthy were constantly in the program. Among those who were graduating in mastering their art in the "Manchester school" were Sybil Thorncliffe, Lewis Casson and Basil Dean. Dean in 1911 became director of the Liverpool Playhouse repertory. In 1913 Barry Jackson founded and directed the Birmingham repertory company and built for it a special theatre. The Liverpool and Birmingham repertories survived, and the latter was able to send companies to London where important conquests were made. The Birmingham company, for instance, was the first to act Shaw's vast "metabolological pentateuch" *Back to Methuselah*, which was given in 1923 at Birmingham and subsequently at the Court theatre in London.

The repertory movement may have often been responsible for hasty and unripe presentations, but there is no doubt that it

evoked new talents in writing and acting and had a freshening and vitalizing effect upon the whole British drama of the period. The theatre was honoured. No man of letters henceforward could be too proud to write for it and it is significant that the most distinguished novelists of the time were eager to be dramatists. One effect, and that an important one, of the repertory movement was to restore the theatre to its proper place in the national culture. The drama became once more representative and expressive of the living mind and the social purpose.

But it must not be supposed that the repertory movement was as widely prosperous as it was intellectually significant. From a financial point of view it was often a failure and the London theatre was still dominated by the actor-manager who chose his plays to suit his particular talent. Yet the sovereignty of such men as Sir Herbert Beerbohm Tree, Sir George Alexander and Sir Charles Wyndham, all of whom died during World War I, was a beneficent form of government compared with that of the financial syndicates which followed them and turned the playhouses into counters in a great game of hazards rather than of skill. The effect of the war on the English drama was inevitably disastrous. When so many towns, particularly the capital, were lodgingshouses between life and death in which men on leave snatched what relief they could, the industry of entertainment naturally flourished at the expense of the art of the theatre. The new syndicates which trafficked in playhouses and plays found a ready market for anything trivial or spectacular which would bring some anodyne to the mind oppressed with care. London was packed with soldiers from all over the world to all of whom a rousing display or a racy farce was at least intelligible. Hence it was that the typical war play was *Chu Chin Chow*, an elaborately oriental panorama with music which ran at His Majesty's theatre for 2,238 performances, or *The Maid of the Mountains*, a highly competent musical comedy which was played at Daly's 1,352 times, or *A Little Bit of Fluff*, a hilarious and risqué farce whose life extended to 1,241 nights. The war brought enormous runs because money was plentiful and taste was not exacting. It was a period of quantity not quality. Sir Gerald du Maurier, one of the surviving actor-managers, did, however, maintain a standard of dignity and restraint and had a long run with *Dear Brutus*.

(I Bx, X)

After World War I—In the early 1920s two main influences were at work upon the theatre, one material and one spiritual. Materially, times were difficult because the competition to acquire London theatres for revues and farces had quadrupled the rents. Spiritually, they were hard for the high-aspiring artist because the public was in a cynical and disillusioned mood. The older generation of playgoers was still faithful to Galsworthy and other products of the prewar repertory movement, and Barrie was still writing, but the spirit of the time was more truly reflected by such plays as W. Somerset Maugham's *Our Betters* (the least considerable of all his works), or the sophisticated and deft comedies of Frederick Lonsdale and Noel Coward. The more sensuous-minded among this public made an idol of Bernard Shaw, who now found himself, much to his surprise and not altogether to his pleasure, the most popular of living dramatists. The essential point about this postwar public, in London at any rate, was that it had taken the lessons of its youth too much to heart, and would tolerate no plays not realistically written and no acting that was not "natural." It seemed, indeed, to be impatient of any drama that did not exactly mirror the normal life of its own time and its own country. Plays of foreign life, even of American life, were seldom acceptable to this public unless they had been adapted to fit the English scene, while the classics, and "period" plays generally, were banished almost entirely from the London stage.

The immediate effect was to drive those managers and playgoers to whom realism was only one among many forms of theatrical expression out of central London and into the suburbs, where financial risks were comparatively small. An outer ring of theatres came into being, on whose stages were seen some of the most memorable productions of the time. First of these theatres, in order of time and importance, was the Old Vic, a large dingy building south of the river near Waterloo station. After beginning as a low music hall, and then struggling to bring a little

uplift into the mean streets about it, it found itself unexpectedly thrust into public notice as Shakespeare's only established refuge in London. Lilian Baylis, its manager, found greatness thrust upon her and rose nobly to the test. Even before World War I ended, Sybil Thorndike had made her name at the Old Vic, and in 1919 Robert Atkins, rejoining the company as stage director, built up a first class team and attracted a public from all parts of London. The Old Vic audience soon became an entity which shared the fame of the theatre, and was almost the only really responsive theatre audience of the time.

Second in distinction only to the Old Vic was the Lyric theatre at Hammersmith, a derelict place rediscovered by Nigel Playfair and opened by him and Arnold Bennett as a home for period pieces. The most popular of the Hammersmith revivals was *The Beggar's Opera*, decorated by Claud Lovat Fraser, which was produced in June 1920, became the rage of the town and ran for nearly four years. Previously, Hammersmith had yielded a long run to John Drinkwater's chronicle play *Abraham Lincoln*. Another of Playfair's notable productions was Congreve's *Way of the World* (in all other hands an intractable masterpiece), in which Edith Evans, as Millamant, first demonstrated her brilliance in artificial comedy. Meanwhile, at Barnes, Philip Ridgeway turned a disused movie house into a theatre and with the help of the Russian producer Theodore Komisarjevsky gave British theatregoers their first real chance to understand Chekhov's plays. Very few grasped the opportunity.

As such a time, the arrival of an actress like Sybil Thorndike at a position of honour in the West End theatre was an extraordinary feat, since she had to swim against the stream of popular prejudice. Remarkable performances of Euripides' *Heccuba* and *Medea* at a series of matinees established her reputation as a tragic actress, and, though she had to demonstrate her abilities in contemporary comedy before the general public lost its mistrust of her, she found a following which enabled her to restore to Shakespeare an insecure foothold on the fashionable stage. This following enlarged itself greatly, however, when the production of *Saint Joan* brought her to the notice of the by now immense Shaw public in 1924. The play, by fairly general consent the most memorable piece of dramatic writing of the time, found in this actress an exponent of the name part the memory of whose performance has never been effaced. If the spirit of the time had been with her instead of against her, she might well have written her name in the list of great tragic actresses. It was her misfortune that she reached the peak of her power at a time when tragedy was not wanted, so that in her later career she had to fall back on her fine but less remarkable comic gifts.

She and her husband, Lewis Casson, however, had done much to keep alive the idea that acting could consist of something more than a mere imitation of the surface of life and so to pave the way for another equally gifted player whose methods were more in accordance with the taste of the time. In 1929 John Gielgud, following the example of other actors of high ambition, sacrificed the rewards of a growing West End reputation to become leading man of the Old Vic, and made so great a success as Hamlet that the fashionable scoffers were not merely silenced but impelled to go on pilgrimage to see him. In the following year the production was repeated at the Queen's theatre, just in time to end an undistinguished and vandalistic decade with a promise of something better in store.

A Dangerous Rival.—In actual fact, the first experience the early 1930s had in store for the theatre was financial disaster on a scale hitherto unimagined. The invention of the talking motion picture destroyed almost overnight the complicated touring system whereby the theatres outside London had been kept supplied with plays. Now that they could hear as well as see world-famous players on the screen, provincial audiences refused to be entertained by less known actors on the stage. Except in the big towns which could offer performances by London companies on tour after successful runs, theatres everywhere were closed down or converted into motion picture houses. It was commonly and quite seriously thought that the theatre, proverbially dying for many generations, was moribund at last, and in the years that followed,

when enthusiastic playgoers had to wait until they could spend a holiday in London before they could indulge their taste, it seemed possible that such prophets of disaster might be right. A whole generation was growing up which had never known what it was to see live actors perform, while the existing London public consisted of middle-aged people who cared nothing for the art of the theatre.

Yet even so, the hope of better things persisted, based on three considerations. First, an unprecedented activity was to be seen in the schools, whose dramatic societies, with the approval and assistance of education authorities, were doing ever more ambitious and effective work and familiarising children with good drama at the most impressionable age. Second, the amateur movement had assumed a new importance. No longer did the amateur actor content himself with repetitions of faded West End successes, the community drama ranged from experiments in mediaeval mystery to the latest philosophy of the intellectual theatre, and with the partial collapse of the professional stage, the movement took on an access of strength. Third, the place of the defunct touring companies was to some extent filled by small repertory theatres which sprang up on all sides and produced a new play every week, working for the most part on incredibly narrow financial margins. These theatres should not be confused with the more solidly established institutions already mentioned which had long existed in large cities—namely Birmingham and Liverpool—in order to give true theatre lovers something outside the limited scope of the commercial theatre. The new stock theatres had as a rule no high artistic aims, they were concerned not to raise the standard of drama, but simply to keep it alive in any form that the public would accept, and the public—except for a small inner circle of enthusiasts—was in no mood for experiment.

Experimental Drama.—But a hopeful sign in the 1930s was that leading dramatists were in such a mood. William Archer, who had fought the battle of realism ever since he had introduced it to the English speaking theatre with his translations of Ibsen, had brought his writing career to an end in 1923 with a claim that victory was won. "Drama," he said in *The Old Drama and the New*, "has cast out the foreign elements of rhetoric and lyricism, and become a pure art of interpretation through imitation." Archer's ink was not long dry when Bernard Shaw, his ally in the Ibsen campaign, went over to the enemy. From 1929 onward he contributed to the Malvern festivals, inaugurated in his honour by Barry Jackson, a series of discussion plays beginning with *The Apple Cart* in which rhetoric had a far more important share than imitation. And in the same year, 1929, Sean O'Casey abandoned the realistic method which had brought him fame with *Juno and the Paycock* and *The Plough and the Stars* and began with *The Silver Tassie* a deliberate attempt to bring back to the stage the other "foreign element," lyricism.

A few years later still J. B. Priestley, who had emerged as a prolific and highly popular dramatist in the realistic manner with *Dangerous Corner* (1932), *Laburnum Grove* (1933), *Eden End* (1934) and others, began experimenting in his turn in *Music at Night* (1938) and *Johnson Over Jordan* (1939). None of these attempts to break down the tyranny of the imitative method received much encouragement. None of Shaw's Malvern plays, except *The Apple Cart* itself, proved popular in London, O'Casey lost his hold on the West End altogether, Priestley's *Johnson Over Jordan* failed with splendour, but it failed. Only T. S. Eliot, with a new conception of poetic drama, could be said to have struck a really effective blow for a freer theatre, and that was because his *Murder in the Cathedral*, written for a Canterbury festival and hardly aimed at a wider public, was able to climb quietly to fame by a multiplicity of modest performances in small theatres before audiences of enthusiasts, and was never forced to compete in the commercial hurly-burly.

World War II.—When World War II broke out, every theatre in Britain was closed by government order, and thereafter, until the Germans broke off their main air attack in May 1941, the "commercial" theatre lived a precarious existence. London, and the big towns generally, ceased to be centres of theatrical activity of any importance. Not until the late summer of that year did the

West End return to normality, and it was then taken sadly for granted that a drop in the standard of public taste similar to that of World War I would happen. The event proved very different. It was true that, as in World War I, the fighting forces on leave liked entertainment of light texture, but a comparison of London's playbills at corresponding points of the two wars proved that whereas in 1914-18 the discriminating playgoer in London could hardly find himself catered for at all, in 1939-45 he could always find intelligent and sometimes serious entertainment. As in World War I, popular plays had very long runs, but this time it was not musical plays or wild farces which topped the thousand performances, but comedies of some merit—Noel Coward's *Blithe Spirit* (1,997), Terence Rattigan's *While the Sun Shines* (1,154), Esther McCracken's *Quiet Week* end (1,059) and the U.S. *Arsenic and Old Lace* (1,337).

Also, during and after World War I an eager escapism had led the public to shun war plays, so that not till 1929 was the first realistic stage representation of the war (R.C. Sherriff's *Journey's End*) presented, and then only with misgiving. This frame of mind was so alien to the spirit of the World War II public that Emlyn Williams' *The Morning Star*, written as a tribute to the tough fibre of London's population under aerial attacks, and containing a realistic representation of a raid, was received with acclamation in Dec. 1941, only six months after those attacks had ceased.

ENSA and CEMA—Meanwhile, many events up and down the country showed that there was no real reason to fear that the art of the theatre would be swamped by a desire for crude relaxation. The Entertainments National Service association (ENSA), a vast organization with Basil Dean at its head, which supplied every kind of show to every branch of the forces, often found itself under criticism if it rated the taste of its audiences too low. The Old Vic, which had withdrawn to Burnley in Lancashire, found responsive audiences in districts which had long had no living theatre at all. Other organizations which sprang up to supply war workers in hostels and camps with drama told the same story. And the Council for the Encouragement of Music and the Arts (CEMA), brought into being to co-ordinate this work with money supplied by the Pilgrim trust and a cautious government, proved its usefulness so thoroughly that it became an entirely state aided department and extended its aims to cover the professional theatre. After the war, under the more resounding title of the Arts Council of Great Britain, it continued to administer government subsidies and to give moral as well as material support to theatrical ventures over a wide field.

Stratford and Old Vic—Perhaps the best barometer of the change in taste is to be found in the history of the new Shakespeare Memorial theatre at Stratford-on-Avon, which was opened in 1932. Up till this time the Stratford festivals had been parochial in character. Sir Archibald Flower, whose family had built the first theatre (burned out in 1926), was anxious to keep this modest quality, and had the support of a majority of the governors. But the new theatre was not a private venture. It had been built and endowed by public international subscription, and pressure of public opinion gradually brought it home to the local authorities that their theatre was now a showpiece and a place of pilgrimage. One continuous season superseded two short ones, and in the years before the war the theatre was commercially successful. Artistically, it remained inadequate to its new status.

During World War II the governors were, naturally enough, content to mark time so far as policy was concerned, but were very soon to discover the changed temper of their audiences. To see the theatre crammed to the doors became an ordinary instead of an unusual experience. At the time this was accounted for by the presence in and near Stratford of Allied armies, particularly Americans, on leave, but after these soldiers left the records of attendance at the theatre rose in spite of transport difficulties unknown before the war. Eager playgoers in every part of the country organized motor-coach trips to Stratford. A new generation of governors, led by Lord Liff and Lieut. Col. Fordham Flower, recognized that the old parochial days were gone and appointed one of their number, Sir Barry Jackson, to reorganize the com-

pany on a more ambitious scale. Under Jackson and his successor, Anthony Quayle, the Memorial theatre at last attained its proper artistic quality as a serious rival to the Old Vic.

The Old Vic itself, by the end of the war, had reached the highest peak yet of its honourable career. In the autumn of 1944 Laurence Olivier and Ralph Richardson (both knighted in 1947) were released from the forces to become codirectors of the company, and for two seasons they led it in a whole series of productions which proved not only that acting on the grand scale was still possible, but that it was once again very much to the public taste. Olivier's Richard III and Oedipus (in *Oedipus Rex*), and Richardson's Falstaff in both parts of *King Henry IV*, were achievements of the highest rank. After these two players left the company in 1946, the organization developed weaknesses and the standard fell for a time, but it had grown to be an understood thing that the Old Vic was the nucleus on which the National theatre—for the establishment of which £1,000,000 was made available by parliament in 1949—would take shape.

Just before the Old Vic's return to London, in the spring of 1943, John Gielgud had had proof of the public's change of heart. He staged Congreve's *Love for Love*, with so little faith in its popular appeal that he produced it as a non-profit-making venture with the backing of the CEMA. It ran for a year.

Retreat from Realism—Side by side with the established naturalistic theatre, therefore, Britain by 1946 had a theatre of universal appeal in which experiments that before World War II would have seemed outrageous had a good chance of success. With responsive audiences, courageous directors and actors who could recall the spaciousness of earlier days without their flamboyance, it seemed possible that a new era of greatness might be about to dawn. There was, however, one very serious obstacle to this—a dearth of new dramatists. The years immediately succeeding the war were singularly unproductive of new plays of distinction, and such as did appear—J. B. Priestley's *The Linden Tree*, Terence Rattigan's *The Winslow Boy* and *The Browning Version*, Emlyn Williams' *The Wind of Heaven*, for instance—showed no sign of any breakaway from naturalism. Economic conditions were difficult, and managers were disinclined to take risks with new works when they could more safely cater for the public's new-found liking for the classics and "period" plays generally.

Not until 1949, indeed, were any new plays written that could be said to reflect the younger generation's catholicity of taste. In that year a new note was struck when *Daphne Laureola*, a piece in James Bridie's most idiosyncratic manner and with almost no plot at all, gave Edith Evans one of her greatest successes, when *The Lady's Not for Burning*, a verse play by Christopher Fry, the first new dramatist of distinction to emerge after the war, ran for many months, and when T. S. Eliot's *The Cocktail Party*, a mystical piece also written in verse, was produced at the Edinburgh festival and acclaimed as a masterpiece. In 1950 another poetical play from Fry's pen, *Venus Observed*, was given a warm welcome for the splendour of its language in spite of manifest faults in the handling of its plot. Not one of these plays could have survived in the West End between the wars, and their success completed the evidence that a fresh and very different chapter of stage history had been opened.

The Rise of the Producer—During the first half of the 20th century there were three distinct phases of theatrical history. An actor's theatre was succeeded by an author's theatre and this in turn was followed by a producer's theatre. Although the stage director never attained in Great Britain to the absolute monarchy which men like Max Reinhardt achieved in Europe, it was an Englishman, Edward Gordon Craig, whose theories and occasional practice inspired this development. Craig's ideas affected the land of his birth only at second hand, but perhaps it was better so. His erratic genius was not well suited to a workaday playhouse, though he would never admit this. Nevertheless, his influence was strong, and English methods of production showed much benefit from the lessons he had to teach. The work of such men as Nigel Playfair, Basil Dean and H. K. Ayllin in the older generation, and Tyrone Guthrie, John Gielgud, Laurence Olivier and Peter Brook among the younger men, showed a power to experiment without

treating the author's text as a mere libretto or the actor as a unit in a regiment of automata. In short, they accepted the threefold partnership between actor, author and producer and worked loyally to sustain it (W A Dn)

FRENCH DRAMA

France was the only country besides Italy in which classical tragedy was naturalized. In 1531 the Benedictine Barthélemy of Loches printed a *Christus Xysticus*, and a very notable impulse was given both to the translation and to the imitation of ancient models by a series of efforts made in the University of Paris and other French places of learning. The most successful of these attempts was the *Johannes Baptistes* of George Buchanan, who taught in Paris for five years and at a rather later date lived at Bordeaux, where in 1540 he composed his celebrated tragedy (afterward translated into four or five modern languages), in which it is now ascertained that he had in view the trial and condemnation of Sir Thomas More. He also wrote *Jephthah*, and translated into Latin the *Medea* and *Alcestis* of Euripides. At a rather later date the great scholar M. A. Muret (Muretus) produced his *Julius Caesar*, a work perhaps superior in correctness to Buchanan's tragic masterpiece, but inferior to it in likeness to life. About the same time the enthusiasm of the Paris classicists showed itself in several translations of Sophoclean and Euripidean tragedies into French verse, and in 1540 Pierre de Ronsard translated the *Philoctetes* of Aristophanes. Thus the beginnings of the regular drama in France came to connect themselves directly with the great literary movement of the Renaissance.

Jodelle—Among the disciples who gathered round Ronsard, and with him formed the "Pliade" of French literature, Étienne Jodelle, the reformer of the French theatre, soon held a distinguished place. The stage of this period left ample room for the enterprise of this youthful writer. The popularity of the old entertainments had reached its height when Louis XII, in his conflict with Pope Julius II, had not scrupled to call in the aid of Pierre Grangore (Grignon), and when the *Mère sotte* had mockingly masqueraded in the petticoats of holy church. In the reign of Francis I the Inquisition, and on occasion the King himself, had to some extent succeeded in repressing the audacity of the actors, whose follies were at the same time an utter abomination in the eyes of the Huguenots. For a time the very mysteries of the Brethren of the Passion had been prohibited, while the moralities and farces had sunk to an almost contemptible level. Isolated translations of Italian as well as classical dramas had in literature begun the movement which Jodelle now transferred to the stage itself. His tragedy *Cléopâtre captive* was produced on the same day as his comedy *L'Eugène*, in 1552, his *Didon se sacrifiant* following in 1558.

The history of French tragedy begins with *Cléopâtre captive*, in the representation of which the author, together with other members of the Pliade, took part. It is a tragedy in the manner of Seneca, devoid of action and provided with a ghost and a chorus. Though mainly written in the five foot iambic couplet, it already contains passages in the Alexandrine metre, which soon afterward J. de la Pérouse by his *Médée* (1556) established in French tragedy, and which Jodelle employed in his *Didon*. Numerous tragedies followed in the same style by various authors, among whom Gabriel Bounyn produced the first French regular tragedy on a subject neither Greek nor Roman (*La Soltane*, 1561) and the brothers Jacques and Jean de la Taille and J. Grévin distinguished themselves by their style. Antoine de Montchretien exhibited unusual vigour of rhetoric and in R. Garnier's much tragedy reached the greatest height in nobility and dignity of style, as well as in the exhibition of dramatic passion, to which it attained before Corneille. In Garnier's tragedies choruses are still interspersed among the long Alexandrine tirades or the dialogue.

Comedy under Italian Influence—During this period comedy had likewise been influenced by classical models, but the distance was less between the national farces and Terence than between the mysteries and moralities and Seneca and the Greeks. *L'Eugène* differs little in style from the more elaborate of the old farces, and while it satirizes the foibles or the clergy without

any appreciable abatement of the old licence, its theme is the favourite burden of the French comic theatre in all times—*le coquage*. The foremost French comic poet of the century, Pierre de Larivey, born in Florence and originally named Pietro Guinta, openly professed to imitate the poets of his native country. His plays are more or less literal translations of L. Dolce, Secchi and other Italian dramatists, and this lively and witty author, to whom Moliere owes much, thus connects two of the most important and successful growths of the modern comic drama.

Much of the French drama of the next age is of the same kind as its romance literature, like which it fell under the polite castigation of Nicolas Boileau-Despréaux's satire. Heroic love (quite a technical passion), "fertile in tender sentiments," seized hold of the theatre as well as of the romances, and G. de C. de la Calprenède, G. de Scudéry (*L'Amour tyrannique*) and his sister and others were equally fashionable in both species. A mixture of the forms of classical comedy with elements of Spanish and of the Italian pastoral was attempted with great temporary success by A. Hardy. The mixture of styles begun by him was carried on by the marquis de Racan, J. de Rotrou and others, and among these comedies of intrigue in the Spanish manner the earlier efforts of Corneille himself are to be classed. Rotrou's noteworthy productions are later in date than the event which marks an epoch in the history of the French drama, the appearance of Corneille's *Cid* (1636).

Corneille—Pierre Corneille is justly revered as the first, and in some respects the unequalled, great master of French tragedy. The attempts of his predecessors had been without life, because they lacked really tragic characters and the play of really tragic passions, while their style had been either pedantically imitative or a medley of plagiarisms. He conquered tragedy at once for the national literature by a few masterpieces, which may be held to be comprehended within the ten years 1636 to 1646, for in his many later tragedies he never again proved fully equal to himself. The French tragedy, of which the great age begins with the *Cid*, *Horace*, *Cinna*, *Polyeucte* and *Rodogune*, was not, whatever it professed to be, a copy of the classical tragedy of Greeks or Romans, or an imitation of the Italian imitations of these, nor, though in his later tragedies Corneille descended less and less upon characters and more and more, after the fashion of the Spaniards, upon situations, and even more upon spectacles, were the forms of the Spanish drama able to assert their dominion over the French tragic stage. The mould of French tragedy was cast by Corneille, but the creative power of his genius was unable to fill it with more than a few examples.

In comedy also Corneille begins the first great original epoch of French dramatic literature, but *Le Menteur* was itself derived from a Spanish original, which it did not (as was the case with the *Cid*) transform into something new.

Racine—The tragic art of Jean Racine supplements rather than surpasses that of his older contemporary. His works reflect the serene and settled formality of the age. That Racine should permanently hold the position which belongs to him in French dramatic literature is due to the fact that to him it was given to present the forms approved by his age in what may be regarded as called perfection. Thomas Corneille, J. G. de Campistron, Joseph Duche (1668-1704), Antoine de Lafoisse (c. 1653-1708) and Philippe Quinault were mere followers of one or both of the great masters of tragedy, though the last-named achieved a reputation of his own in the bastard species of the opera.

The type of French tragedy thus established, like everything else which formed part of the "age of Louis XIV," proclaimed itself as the definitively settled model of its kind, and was accepted as such by a submissive world. The unities of time and place, with the Greeks mere rules of convenience, French tragedy imposed upon itself as a permanent yoke. The Euripidean prologue was judiciously exchanged for the exposition of the first act, and the lyrical element essential to Greek tragedy is easily suppressed in its would be copy, lyrical passages still occur in some of Corneille's early masterpieces, but the chorus is consistently banished, to reappear only in Racine's latest works as a scholastic experiment appropriate to a conventual atmosphere. Its uses for ex-

planation and comment are served by the expedient, which in its turn becomes conventional, of the conversations with *confidants* and *confidantes*, which more than sufficiently supply the foil of general sentiments. The epical element is allowed full play in narrative passages, more especially in those which relate parts of the catastrophe, and, while preserving the stage intact from realisms, suit themselves to the generally rhetorical character of this species of the tragic drama.

18th Century Tragedy—The universal genius of Voltaire found it necessary to shine in all branches of literature. He succeeded in impressing the world with the belief that his innovations had imparted a fresh vitality to French tragedy, in truth, however, they represent no essential advance in art, but augmented the rhetorical tendency which paralyzed true dramatic life. Such life as his plays possess lies in their political and social sentiments, their invective against tyranny and their exposure of fanaticism. In other respects his versatility was barren of enduring results. Voltaire's would be rival, the "terrible" Crebillon the elder, professed to vindicate to French tragedy, already mistress of the heavens through Corneille, and of the earth through Racine, Pluto's supplementary realm, but, though thus essaying to carry tragedy lower, failed to carry it farther. Shakespeare, as manipulated by J. F. Ducis—an author whose tastes were better than his times—failed to bring about a change. "It is a Moor, not a Fienchman, who has written this play," cried a spectator of Ducis's *Othello* (1791), but F. J. Talma's conviction was almost as strong as his capacity was great for convincing his public, and he certainly did much to prepare the influence which Shakespeare was gradually to assert over the French drama, and which was aided by translations, more especially that of Pierre Letourneur (1736–88), which had attracted the sympathy of Diderot and the execrations of the aged Voltaire. Like Rachel after him, Talma reconciled French classical tragedy with nature.

Molière—The rival influences, under which classical tragedy after a long struggle virtually became a thing of the past in French literature, are also to be traced in the history of French comedy, which under the co-operation of other influences produced a wide variety of growths. The germs of most of these—though not of all—are to be found in the works of the most versatile, the most sure footed and, in some respects, the most consummate master of the comic drama whom the world has known—Molière. What Molière found in existence was a comedy of intrigue, derived from Spanish or Italian examples, and the elements of a comedy of character, in French and more especially in Italian farce and ballet pantomime. Corneille's *Le Menteur* had pointed the way to a fuller combination of character with intrigue, and in this direction Molière's genius exercised the height of its creative powers. After beginning with farces, he produced in the earliest of his plays (from 1652), of which more than fragments remain, comedies of intrigue which are at the same time marvellously lively pictures of manners, and then proceeded, with the *Ecole des maris* (1661), to begin a long series of masterpieces of comedy of character.

Molière is both a satirist and a humorist, he displays at times the sentiments of a loyal courtier, at others that gay spirit of opposition which is all but indispensable to a popular French wit. His comedies offer elaborate and subtle—even tender—pictures of human character in its eternal types, lively sketches of social follies and literary extravagances, and broad appeals to the ordinary sources of vulgar merriment. Light and perspicuous in construction, he is master of the delicate play of irony, the penetrating force of wit and the expansive gaiety of frolicsome fun. His morality is the reverse of rigid, but its aberrations are not those of prudence, nor its laws those of pretense. He raised the comedy of character out of the lower sphere of caricature, and in his greatest creations subordinated to the highest ends of all dramatic composition the plots he so skillfully built and the pictures of the manners he so faithfully reproduced.

Molière's Successors—If the mantle of Molière can be said to have fallen upon any of his contemporaries or successors, this honour must be ascribed to J. F. Regnard, who imitated the great master in both themes and characters.

In the next generation (that of Voltaire) comedy gradually—

but only gradually—surrendered for a time the very essence of its vitality to the seductions of a hybrid species, which disguised its identity under more than a single name. A. R. Lesage, who as a comic dramatist at first followed successfully in the footsteps of Molière, proved himself on the stage as well as in picturesque fiction a keen observer and immutable satirist of human life. The light texture of the playful and elegant art of J. B. L. Gresset was shown on the stage in a character comedy of merit (*Le Méchant*), and in a comedy which reveals something of his pointed wit (*La Métronomie*). A. Piron produced something like a new type of enduring ridiculousness.

P. C. de Marivaux is usually supposed to have formed the connecting link between the "old" French comedy and the "new" and bastard variety. Yet, in *marivaudage* proper the wit holds the balance to the sentiment, and in some of this writer's earlier and most delightful plays the elegance and gaiety of diction are as irresistible as the pathetic sentiment. Some of the comedies of P. H. Destouches no doubt have a serious basis, and in his later plays he comes near to a kind of drama in which the comic purpose has been virtually submerged. The writer who is actually to be credited with the transition to sentimental comedy was Nivelle de la Chaussée, in whose hands French comedy became a champion of the sanctity of marriage, and reproduced the sentiments—in one instance even the characters—of Richardson. To his play *La Pausse antipathie* the author supplied a critique, amounting to an apology for the new species of which it was designed as an example.

The new species known as *comédie larmoyante* was now fairly in the ascendant, and even Voltaire, who had deprecated the innovation, introduced the sentimental element into some of his comedies. The further step, by which *comédie larmoyante* was transformed into *tragédie bourgeoise*, from which the comic element was to all intents and purposes extruded, was taken by a great French writer, Denis Diderot, to whose influence it was largely due that the species which had attained to this consummation for more than a generation ruled supreme in the dramatic literature of Europe. Diderot announced his plays as examples of a third dramatic form—the *genre sérieux*—which he declared to be the consummation of the dramatic art. Making war upon the frigid artificiality of classical tragedy, he banished verse from the new species. The theatre was to become a real and realistic school of the principles of society and of the conduct of life.

Comedy of the Revolution and First Empire—Among the successful dramatists following on Diderot may be mentioned the critical and versatile J. F. Marmontel, and more especially M. J. Sedaine, who though chiefly working for the opera produced two comedies of acknowledged merit (*Le Philosophe sans le savoir* and *La Gageure imprévue*). P. A. C. de Beaumarchais (1732–99), who for his early sentimental plays, in which he imitated Diderot, invented the appellation *drame*—so convenient in its vagueness that it became the accepted name of the hybrid species to which they belonged—in two works of a very different kind, the famous *Barbier de Séville* and the still more famous *Mariage de Figaro*, boldly carried comedy back into its old Spanish atmosphere of intrigue, but, while surpassing all his predecessors in the skill with which he constructed his frivolous plots, he drew his characters with a lightness and sureness of touch peculiar to himself, and seasoned action as well as dialogue with a political and social meaning which marks his *Figaro* as a herald of the Revolution.

The comedy of the Empire is, in the hands of Collin d'Harleville, Louis Picard (1769–1828), A. Duval, C. G. Étienne and others, mainly a harmless comedy of manners. Sedaine was the father of the *opéra comique* proper, J. F. Marmontel, as well as J. J. Rousseau, likewise composed *opérettes*—a smaller sort of opera, at first of the pastoral variety, and these flexible species easily entered into combination. The melodrama proper, of which the invention is also attributed to Rousseau, in its latter development became merely a drama accentuated by music.

The chief home of the regular drama, however, demanded efforts of another kind. At the Théâtre Français, or Comédie Française, whose history as that of a single company of actors had begun in 1680, the party strife of the times made itself

rudible, and the most prominent tragic poet of the Revolution, M. J. de Chenier, a disciple of Voltaire in dramatic poetry as well as in political philosophy, wrote for the national stage the historical drama—with a political moral—in which in the memorable year 1789 the actor Talma achieved his first complete triumph. But the victorious Revolution proclaimed among other liberties that of the theatres in Paris, of which soon not less than 50 were open. In 1807 the Empire restricted the number to nine and reinstituted the *Théâtre Français* in sole possession (or nearly such) of the right of performing the classic drama. The tragedies of C. Delavigne represent the transition from the expiring efforts of the classical to the ambitious beginnings of the romantic school of the French drama.

The Romantic School—Of modern romantic drama in France it must suffice to say that it derived some of its characteristics from the general movement of romanticism which in various ways and at various points of time transformed nearly every modern European literature, others from the rhetorical tendency which is a French national feature. Victor Hugo was the founder whom it followed in a spirit of high emprise to success upon success, his own being the most conspicuous of all, A. Dumas the elder its unshrinking middleman. Together with them may with more or less precision, be classed in the romantic school of dramatists A. de Vigny and George Sand, neither of whom, however, attained to the highest rank in the drama. Jules Sandeau and A. de Musset, whose originality pervades all his plays, and whose later works, more especially his prose "proverbs" and pieces of a similar kind, have a flavour of delicacy altogether indescribable.

The theatrical fecundity and the remarkable constructive ability of E. Scène supplied a long series of productions attesting the rapid growth of the playwright's mastery over the secrets of his craft. After a fashion which would have startled even Diderot, while recalling his efforts in the earnestness of its endeavour to arouse moral interests to which the theatre had long been a stranger, A. Dumas the younger set himself to reform society by means of the stage.

The extraordinary versatility of V. Sardou and his unflinching constructive skill was applied by him to almost every kind of serious or serio-comic drama—even the most solid of all. In the same period, while E. Pailleron revised some of the most characteristic tendencies of the best French satirical comedy in ridiculing the pompous pretentiousness of learning for its own sake, the high-spirited gaiety of E. Labiche changed into something not altogether similar in the production of the comic muse of L. Halevy and H. Meilhac, rising from the licence of the musical burlesque which was the congenial delight of the later days of the Second Empire to a species of comedy in which the ingredients of humour and even of sadness found a place. (P. M. A. F., X.)

Modern Schools—The long-disputed success of the naturalistic school earned everything before it during the years 1879-85. Henry Becque succeeded in embodying the new theories in two plays, which at first met with very indifferent success, but were revived at a later period and finally obtained permanent recognition. In *Les Corbœux* (1882) and *La Parisienne* (1885) the characters are left to tell their own tale in their own words, which are sometimes very comical, sometimes very repulsive, but purport to be always true to nature. Along with Becque may be mentioned the witty and incisive Jules Renard, who might be characterized as a bitter and modern Molière.

Contemporary with the naturalistic theatre, but quite different as to aims and content, was the symbolist theatre. The first plays of Villiers de l'Isle-Adam, such as *Morgane* (1862), with all their flamboyant rhetoric, can be readily traced back to the romanticists. But Villiers's later work is typically of the symbolist exploration of the world within, as opposed to the world without—*Une évasion* (1887), *Axel* (1890)—and consequently, though of great literary value, it does not lend itself to the demands of the stage. Wholly romantic was Edmond Rostand, who created a sensation with *Cyrano de Bergerac* (1897) and *L'Aiglon* (1900), but the favourable impression did not last and *Chantrelle* (1910) was only half a success. The naturalistic tendency took a social direction with

Paul Hervieu, and Eugène Brieux tackled even bigger social problems, which he perhaps oversimplified, in *La Robe rouge* (1900) and *Les Avariés* (1901). Trusted Bernard, Georges Courteline and Georges Feydeau all achieved success in the lighter and some times the lightest or grossest kind of comedy.

As exceptions among the exponents of the poetic drama, which is usually meant to be read rather than acted, may be mentioned Maurice Maeterlinck and Alfred Jarry, whose works are, in very different ways, meant to be acted. Whereas Jarry, in his *Ubu plays*—*Ubu Roi* (1895), *Ubu Enchaîné*—succeeds in reconciling the refinements and subtleties of symbolist poetry with vulgar speech, Maeterlinck wrote in startlingly simple language, at the same time as he drew upon all the resources of modern sensibility. On the other hand, the third great symbolist playwright, Paul Claudel, in his rich and varied contributions, revived the mediaeval mysteries and the exuberance of Renaissance drama. *Partage de Midi* (1906), *L'Otage* (1911) and *Le Soulier de Satin* (1918).

Subsequent trends in French literature proved to be even more antithetical, if possible, to the spirit of the theatre. The surrealism movement, which drew upon the best energies of a new literary generation, although too often confusing "acting" with action, had little contact with the theatre, save in a marginal way, the plays of Roger Vitrac and Raymond Roussel may be mentioned. The actor poet Antonin Artaud, also surrealist, although important for the influence he exerted upon new dramatic theories, did not actually write any plays.

In the 1930s the clever but thin and quickly dated plays of Jean Cocteau and Jean Giraudoux successfully held the stage, but they may be said to have been already symptomatic of a certain decadence. More vigorous and less precious, although without introducing any intrinsically new features, the plays of Jean Anouilh and Armand Salacrou held the boards for long runs during the 1940s. It is a fact, however, that for sheer lack of original theatrical material, such excellent directors as Louis Jouvet, Charles Dullin, Gaston Baty, Georges Pioch, Jean Louis Barrault and Jean Vilar were obliged to devote the best of their energies to reinterpretations and innovations of form in presenting classics.

After World War II, the hopes aroused by the first attempts of the existentialist group to embody new ideas in the theatre were disappointed. The well written dramas of Jean Paul Sartre, Albert Camus and Simone de Beauvoir all bore too obvious testimony to the philosophical theories of their authors for it to be possible to judge them as contributions to theatrical literature.

SPANISH DRAMA

The Beginnings—Spanish drama, which in the 16th century sprang into life and rapidly achieved fame, developed slowly before the Renaissance and produced hardly anything of merit which still survives. As in other countries of Europe, it evolved gradually from liturgical rites, emerging from within the church to portico or cloister, and then moved slowly toward secularization. Its quality is illustrated in 147 extant lines from an Epiphany play, the *Auto de los Reyes Magos*, written chiefly in rhymed couplets, rudimentary in technique but with touches of humour and occasionally some vitality.

By the late 16th century drama was largely secularized, though still somewhat rudimentary. Omitting Fernando de Rojas, whose 21-act *Celestina* (c. 1499), one of Spain's greatest masterpieces, was never intended for acting, the leading dramatists of this period are three. Juan del Encina, an Italianate poet, composed pastoral dialogues, which he termed "eclogues." Gil Vicente, a Portuguese, influenced by Encina, displayed more art, especially in characterization, and more poetry. Bartolomé de Torres Naharro, in a collection of eight plays (*Propaladia* [1517]), anticipated

golden age drama in construction, characterization and types of play

In the next generation two more playwrights excel. Lope de Rueda (c. 1510-1565) in his prose comedies democratized a genre born in the church and nurtured by the aristocracy but soon to be long to the people. Strongly influenced by Plautus, he wrote prose interludes, or *pasos*, oscillating between realism and caricature, for the companies of professional actors now becoming characteristic of Spanish life. Somewhat later, Juan de la Cueva (c. 1550-c. 1610) utilized ballad material, created the historical play, introduced new metres and exploited ideas expounded in his *Exemplar poético* (1606).

Lope de Vega—One of the most prolific geniuses in history, Lope Felix de Vega Carpio (1562-1635) matched his vast output, of which we have about 500 plays (said to be only a quarter of the whole) and 21 volumes of nondramatic work, by an amazing variety and a remarkably high average of merit. His freshness, abandon and spontaneity are typical of the late 16th century never a pedant, always a poet, he was still writing, when over 70, as if in his prime. Action, usually motivated by love, is his outstanding trait, mastery in exposition and skilful intrigue, he is sometimes careless in denouements, his characters, though lively and often attractive, have no depth and little verisimilitude. Essentially a people's playwright, he wrote primarily to please, his *Arte nuevo de hacer comedias en este tiempo* describing his principles and methods.

With some exceptions, his plays, all written in verse, fall into three divisions: (1) In the "cloak and sword play," or *comedia de capa y espada* (e.g., *El Acero de Madrid*), the chief characters belong to the upper middle class, its plot, based on gallantry, is regulated by a conventional code of honour, whose rules all playgoers knew, its charm lies in rapid action, a complicated plot and witty, vivacious dialogue. (2) In the heroic drama (e.g., *El Mejor Alcalde*, *el Rey*), the leading personages are of exalted, even royal, rank, the issues involved are grave, and the background is often historical. Both this and the preceding type of play have humorous underplots. (3) In the domestic drama (e.g., *El Curdo en su casa*) such low life characters as appear in these underplots are introduced as the principal actors. But outside these classes stand plays exhibiting the utmost variety. Such are *El Caballero de Olmedo*, an almost pure tragedy, an idyllic comedy, *El Remedio en la desdicha*, *Peribáñez and Fuente Ovejuna*, rugged vindications of democracy, and plays of the miracle and mystery type, such as *El Cardenal de Belén*. Lope was long credited, too, with the authorship of a first rate historical play, *La Estrella de Sevilla*, now generally attributed to Pedro de Cárdenas y Angulo.

Forming a group, almost a school, around Lope were many outstanding dramatists. The greatest, a Mercedarian friar named Gabriel Téllez ("Tirso de Molina," c. 1584-1648), equals his master in invention and surpasses him in characterization, especially in the delineation of women. His greatest dramas (*El Burlador de Sevilla*, one of the two principal Spanish treatments of the national type Don Juan, *El Condenado por desconfiado*, an impressive and searching theological drama, and *La Prudencia en la mujer*, a historical play with a fine heroine) rank with any written in Spain.

The Mexican Juan Ruiz de Alarcón (c. 1581-1636), a moralist who wrote fewer plays than most of his contemporaries, used considerable gifts of technique and characterization to attack such vices as slander and deceit. From his *La Verdad sospechosa* Corneille took *Le Menteur* and his *Cid* from the *Mocedades del Cid* of Guillén de Castro y Bellvis (1569-1631), another Lopean, best known by this one play. Below these, though still high, stand Antonio Mira de Amescua (c. 1577-1644) and Luis Vélez de Guevara (1579-1644). One magnificent play, *Del Rey abajo, ninguno*, a vindication of the Spanish yeoman against an oppressive aristocracy, distinguishes Francisco de Rojas Zorrilla (1607-48), who also wrote numerous comedies of character and intrigue, and forms a bridge between Lope and Calderón.

Calderón—Pedro Calderón de la Barca (1600-81) dominates the second, or baroque, epoch of the golden age, as Lope de Vega dominated the first, and thus inevitably challenges comparison

with him. To German romantic critics, who rated him equal with Shakespeare, he appealed by his brilliant imagination, reflectiveness and portrayal of character, which more than atoned for his artificialities in characterization and style. These merits are illustrated in his greatest religious and philosophical plays *La vida es sueño*, *El Magico prodigioso*, *El Principe constante* and *La Devoción de la Cruz*. But he could also write lively cloak-and-sword comedies (e.g., *La Dama duende*), and in *El Alcalde de Zalamea*, based on an identically entitled Lopean play, he combines naturalness, deep human interest and effective technique. With him the honour concept present in drama since Lope de Vega, assumes its most extreme form. He excels, too, in the one-act *auto sacramental*, a type essayed by many others but chiefly associated with him.

Only Agustín Moreto y Cavaña (c. 1618-69), who wrote charming character plays and comedies of manners (*El Lindo Don Diego*, *El Desdén con el desdén*), approaches Calderón in merit as nearly as the group already described approaches Lope. When Calderón died, Spanish drama had been the predominant genre for more than a century. Even Miguel de Cervantes Saavedra, whom a novel was to immortalize, coveted stage renown and with *Ocho comedias y ocho entremeses* went far toward achieving it. But no single dramatist of merit survived Calderón.

The Rise and Decline of Romanticism—Between 1680 and 1830 no dramas of any merit were produced, save for the sparkling one act plays (*saetes*), picturing contemporary life, of Ramon de la Cruz (1731-94) and Juan Ignacio González del Castillo (1763-1800), and five deservedly popular neoclassical comedies by Leandro Fernández de Moratín (1760-1828), an admirer and translator of Moliere, who followed him recognizably, if afar off.

Throughout the 18th century, Spanish literature, and especially drama, was subservient to France. Until about 1750, neoclassicism was *de rigueur*, golden age literature, essentially romantic in character, lost prestige, and the test of dramatic merit became conformity with rule. Lope and Tirso were dismissed as "barbarians", the *auto sacramental* was prohibited by law (1765). Most of the third rate plays current in Spain came from, or via, France. Dissatisfaction with these led to the vogue of nonliterary plays, such as the pantomimic *comedia de magia*, the lachrymose *tragedia urbana* and the distinctively Spanish *comedia heroica*. As the 18th century proceeded, golden age drama was gradually reintroduced, in emasculated form, by *refundiciones* adapting it to neoclassical taste.

Between 1750 and 1830, theorists advanced in the direction of romantic ideals also. Whereas Ignacio Luzán's *La Poesía* (1737), which, broadly speaking, followed Boileau, had decried golden age drama, Tomás de Ercilla y Zavaleta (1750), Juan Cristóbal Romea y Tapia (1763), Francisco Nieto de Molina (1768), Francisco Cerda y Rico (1776) and many other critics eulogized it. Moratín, in his *Comedia nueva* (1792), eloquently defended Calderón, Rojas Zorrilla and Moreto, and both they and Lope were now being increasingly published and performed. Tirso reappeared only during the early 19th century.

The emergence of a full-fledged romanticism was delayed by the arbitrary rule of Ferdinand VII (1814-33) and the exile of many leading writers. It declared itself, on the stage, with Francisco de Paula Martínez de la Rosa's *La Conjuración de Venecia* (1834), the Duke de Rivas' *Don Álvaro* (1835), Antonio García Gutiérrez's *El Trovador* (1836) and Juan Eugenio Hartzenbusch's *Los Amantes de Teruel* (1837), none of which, however, had any continuous success. Numerous less meritorious plays, and translations from Hugo, Dumas and second- and third-rate French dramatists, flooded the stage, but Moratín and the neoclassical Manuel Breton de los Herreros attracted too. Soon it became clear that, though romanticism might survive (as it did) as an influence and a tendency, it was doomed, as a self-conscious movement, to failure. It was succeeded by an eclecticism which took what was best from the two rival schools, and, in drama, looked back to the golden age, drew extensively on Spanish history, deprecated alike the restrictions of the neoclassicists and the exaggerations of the romantics and welcomed all genius irrespective of literary creed.

Apart from José Zorrilla y Morán (1817-93), whose *Don Juan Tenorio* (1844) eclipsed Tirso de Molina's *Burlador* in popularity, though not in merit, romantic drama had only one more outstanding exponent, José Echegaray y Eizaguirre (1832-1916). Manuel Tamayo y Baus (1829-98) now alternated and now mingled classical and romantic, combining them most skillfully in *Un Drama nuevo* (1867). Social drama appeared in Joaquín Dicenta's *Juan José* (1895) and in *Electra* (1900) and other plays by Benito Pérez Galdós (1845-1902).

Contemporary Drama—But the modern era in drama began with Jacinto Benavente, an outstanding, though solitary, figure, whose 'theatre of ideas,' European rather than Spanish and strongly tinged with symbolism and irony, brought its author the Nobel prize and the drama of Spain world prestige. Less varied and profound, but more Spanish, was Gregorio Martínez Sierra (1881-1947), the delicacy of whose art is equally observable in his theme fervently religious, brilliantly mundane or dreamily fantastic. With him may be ranked the brothers Serafin (1871-1938) and Joaquín (1873-1944) Álvarez Quintero, who, in vivid, shimmering dialogue, re-created the grey surface of life in Andalusia. Equally superficial, but less inspired are Manuel Linares Rivas, a master of plot and dialogue, and a highly lyrical dramatist from Granada, Francisco de Villaseca. Lyrical drama is also strongly represented by three very different geniuses, Ramón María del Valle Inclán, Eduardo Marquina and Federico García Lorca. One of the most striking characteristics of 20th century drama was the invasion of this field by exponents of other genres—e.g., the essayist Azorín (José Martínez Ruiz), the essayist and poet Miguel de Unamuno, the novelist and poet Valle Inclán.

The tradition of the one act play (*entremés, auto, sainete*) was revived in the *genero chico*, initiated by Ricardo de la Vega (son of the neoclassical dramatist Ventura de la Vega) and Tomás Luceño, its popularity being enhanced by attractive music. Its vitality, often heightened by caricature and farce, soon became irresistible, and writers of *entremés, sainetes* and *saraguelas* sprang up everywhere. Contemporary with Vega and Luceño were F. J. de Burgos, E. Blasco and Vital Aza, somewhat later came José López Silva, Enrique García Álvarez and—perhaps the best—Carlos Arniches (1866-1943).

PORTUGUESE DRAMA

The genius of Portuguese literature being essentially subjective, drama is, quite understandably, its weakest genre. Its first great playwright, Gil Vicente (c. 1465-c. 1536), wrote more than 30 plays, either in Portuguese, or in Portuguese mixed with Spanish, notable among them the trilogy of the *Barras* (*Inferno, Purgatorio, Glória*) and the *Comedia de Inês Pereira*. Patronized by King Manuel I, a virtuoso, he became court dramatist, but, as both poet and musician, he was able to please without having great technical skill. Nevertheless, he fully equals the Spaniards of his day, his epico-dramatic plays are not inferior, he has much broader humour, his characterization is vivid and individual and he represents the Portuguese contemporary Portuguese life. But he had no direct followers. António Ribeiro Chaves and Afonso Álvares are mere imitators while Jerónimo Ribeiro, Baltasar D. de Almeida, António Prete, and Jorge Pinto, writing plays of the same type, seldom equal him. Classical comedies based on Plautus and Terence and influenced also by Italy, was introduced into Portugal by another talented court poet, Francisco de Sá de Miranda (c. 1485-1557), author

of the *Estrangeiros* and *Vilhainpandos*. Classical tragedy is represented by A. Ferreira's *Inês de Castro* (c. 1557), which, however, though eloquent and poetic, is technically poor. Of Luis de Camões' three early plays (c. 1544-49), *Flóidemo* and *El Rei Seulo* recall Vicente, and *Os Amphições*, in Portuguese and Spanish, is based on Plautus.

Jorge Ferreira de Vasconcelos' *Eufrosina* and *Aulegracia*, though dramatic in form, are, like the Spanish *Celestina*, not intended for acting.

The 17th century is devoid of drama and the 18th has only a group of frigidly classical plays by António José da Silva. Domíngos dos Reis Quarta's tragedy *Inês de Castro*, which inspired a more successful work, João Baptista Gomes' *Nova Castro*, and an anonymous tragedy *Osma* (1788). The romantic movement, however, preceded the best play since Vicente, the Visconde de Almeida Garrett, who, after a false start with the classical *Mélope* and *Cálio*, wrote prose plays on national themes, noted equally for technique and power—*Um Auto de Gil Vicente* (1838), *Dona Filipa de Vilhena* (1840), *O Alageme de Santarem* (1842) and—the best—*Pres Lus de Sousa* (1844).

Almeida Garrett, like Vicente, outshone his numerous contemporaries. But toward the end of the century gifted writers created interest in historical drama. João da Camara (1852-1908), known also for his comedies of manners, fantasies and one act plays, Marcelino Mesquita, who wrote moving tragedy, and Henrique Lopes de Mendonça, who depicted contemporary peasant life better than he did history. Greater than any of these are António Patrício, author of *D. João e a Mascara*, and Raul Brandão (1867-1930), remarkable for his psychological insight in plays such as *O Dado e a Morte* and *O Gato e a Sombra*. Ernesto Biesler and Gervasio Lobato wrote light sketches of contemporary life, and Eudoro Schwilbach, Augusto de Castro, Augusto Lacerda and Bento Muntua are essentially writers of comedy. Júlio Dantas (1876-), with keen historical insight, sure touch and charm of style, portrays 17th century and 19th century Portugal with equal success.

After World War II the leading playwrights were José Régio, who chose metaphysical themes for his plays *Jacob e o Anjo*, *Benilda ou a Virgem Mãe*, and Miguel Torga, author of *Mar and Sinfonia*.

ITALIAN DRAMA

In the history of the European theatre after the middle ages, Italian drama occupies an important place, which it owes to individual works of high value written at various periods and to the introduction of theatrical forms with innovations in scenic effects and in the actors' art. In the middle ages the religious theatre represented the aspirations of a whole civilization toward dramatic expression, a fine example of its kind is the dramatic *lauda* or hymn of praise by Jacopone da Todi (c. 1230-1306) entitled *Pianto della Madonna*. The religious dramas still occupied the attention of writers and audiences at the height of the 15th century, and this dramatic form was revived by humanist writers with a new artistic purpose and, in particular, with theatrical effect in view.

The humanist's love of the classical world, for its literary perfection and its promise of a life of dignity and freedom, encouraged the rise of secular drama, the *teatro profano*. The poetic gift of the new writers that the humanist culture brought forth, the stimulus of elegant court life and the research carried out by painters and scholars in the art of perspective led, toward the end of the 15th century and the beginning of the 16th, to the birth of a theatre in the true sense of the word.

From the Renaissance to Romanticism—Italian tragedy began at the Renaissance, with that feverish outburst of literary and poetic activity which, after a period of culture and study, brought with it the rediscovery of classical forms. And it was in

the form of "imitations" of the Roman and Greek tragic dramatists that the first Italian tragedies appeared. On the other hand the ascendancy of the Aristotelian precepts with their rigid rules of the three unities considerably restricted the freedom of the dramatists, who aspired above all to approach as nearly as possible to that dignity and regularity they attributed to the ancients. Thus G. G. Trissino in the first real tragedy, *Sofonisba* (1515), was cold and solemn in faultless hendecasyllables, so, too, was G. Rucellai with his *Rosmunda*, and even Torquato Tasso himself with his *Torrismondo* (1587), in which a tired lyricism cannot balance the essential lack of tragic spirit, and also G. B. Giraldi Cinzio (or Cynthius), who encouraged a pursuit of the horrific and macabre by imitating Seneca in his *Orbecchie* (1541) and of the adventurous and monstrous in *Alibab* (1543). Cinzio expounded his poetic theories in his *Discorso sulle commedie e sulle tragedie* (1543). He was imitated by S. Speroni in *Canace* and, in general, by the tragic playwrights of the latter part of the century, such as L. Dolce (*Marianna*, 1565), A. D'Uccio (*Arispanda*, 1501) and M. Manfredi (*Semiramide*, 1592). A greater vigour and freedom of expression can be found in *Orsina* by P. Artino (1546) and in the tragedies of P. Torelli (1539-1608), *Merope*, *Tancredi*, *Galatea*, *Vittoria* and *Polidoro*.

During the baroque period the uniformity established in the preceding 16th century (the three unities, the division into five acts, the chorus) remained generally accepted and unchallenged, with a compromise between Greek and Senecan imitation. Nevertheless, new material from the political world, from the conflict between love and duty and from that between religion and individual instinct brought fresh vitality to the tragic theatre of the 17th century, particularly in the noteworthy *Aristodemo* by Carlo Dottori (1657) and in the tragedies of Federico della Valle, *Judith* and *Esther* (1627) and *La Rema di Scozia* (1628), in the latter plays compelling language and a genuine dramatic sense combine to express Della Valle's profound personality. An interest in the political world and a pompous, moralistic tone were common to many dramatists when the influence of French classicism and the tragedies of Corneille began to make itself felt, in religious drama a musical tendency, clearly visible in *Maddalena* and *Adamo* by G. B. Andreini, prevailed against attempts to fuse classical style and Christian elements together.

At the beginning of the 18th century a group of *trattatisti*, or didactic writers, sought to apply their theories in order to produce a simpler, less rigidly confined classical style, in reaction against the Aristotelian precepts and the spectacular, grandiose taste of the previous century. These writers included G. V. Gravina, with his treatises *Della ragion poetica* and *Della tragedia* and his five very frigid tragedies, P. J. Martelli, with his dialogue *Della tragedia antica e moderna* and his tragedies in verse imitating the French Alexandrine, and S. Maffei, whose *Merope* (1713), with its straightforward technique and use of simple blank verse, with out chorus, apologies or complicated stage machinery, was a most praiseworthy example of his championship of classicism in the French style, which influenced the theatre of the Arcadian period. Other examples of this influence are the tragedies of A. Conti (1677-1749), who in his *Giulio Cesare* and other works showed also the influence of Shakespearean tragedy.

The writer who in the second half of the 18th century contributed most to Italian drama was Count Vittorio Alfieri (1749-1803). A vigorous, poetical personality, forerunner of romanticism in his aspirations toward unfettered freedom, a lyricist in *Rime* and *Vita* and a political thinker, Alfieri turned to tragedy to express his passion and revolt. The Alfierian drama took for its main theme the struggle between the free man and the tyrant, with the devious intrigues of court life for its setting. His greatest tragedies, *Saul* (1782) and *Murra* (1784-87), went beyond the boundaries of the merely political. The first named is the tragedy of the Hebrew king, devoured by jealousy of David, consumed by the anger within him, unquiet of spirit and abandoned by God. *Murra* tells of the unhappy fate of a sensitive feminine soul oppressed by a morbid passion. The concise language and vigorous verse and the feeling of solitude with which Alfieri surrounds his characters make his tragedies the most important poetical expres-

sion of the 18th century.

In his three tragedies Ugo Foscolo closely imitated Alfieri, and the latter's influence is also apparent in the work of the greatest tragic writer of the Italian romantic school, Alessandro Manzoni, who, in *Il Conte di Carmagnola* (1816-20) and *Adelchi* (1820-21), gave personal expression to the romantic theories of historical drama. Religious and national sentiments inspired the Manzoni theatre, primarily political aims, linked with *Risorgimento* ideals, coloured the weak and often rhetorical tragedies of S. Pellico and G. B. Niccolini (*Arnaldo da Brescia*, 1849).

Pastoral Plays and Melodrama.—At the beginning of the 15th century pastoral fables were found, notably at the court of Ferrara, to be much in demand on the stage. *Egle* by Cinzio (1545) and *Sacrificio* by A. Beccan (1554) are the first examples of a dramatic composition in which tragic and comic elements are intermingled and shown against an idyllic background of pastoral life seen through the eyes of courtiers. In 1573 *Aminta*, a masterpiece, by Tasso, was produced, *Il Pastor fido* by G. B. Guarini followed in 1590, and to these examples may be added the *Filii di sciro* by Gundobaldo Bonarelli.

Although in tragedy the 16th century had unsuccessfully tried to express deeply tragic subjects in decorous, classical style, in pastoral drama it achieved truly artistic expression in a field all its own. The longing for a natural world, freed from impersonal laws and dominated by pleasure, resulted in an emotionally complex plot and a sensitiveness both musical and charming. In a certain sense pastoral drama is the forerunner of melodrama.

At the beginning of the baroque period, the Italian theatre introduced a new type of drama, called *melodrama*, which combined poetry, music and dance. The theory of Vincenzo Galilei (*Dialogo della musica antica e moderna*, 1581) and the collaboration of musicians such as Jacopo Peri and G. Caccini produced the first attempts to adapt the pastoral works of the late 16th century to music and influenced, later, the first true melodramas written by Ottavio Rinuccini (1562-1621), author of *Dafne*, *Euridice* and *Arianna*, and set to music by Peri and Claudio Monteverdi. During the 17th century increasing emphasis was laid on the spectacular elements in melodrama. The art of choreography and the creation of settings prevailed over the poetry.

In the 18th century Apostolo Zeno made an effort to raise the librettos of the melodramas to a higher political level and to rescue them from the vulgarity and extravagances of the 17th century "virtuosos." But it was Metastasio (Pietro Trapassi) (1698-1782) who brought in original, poetic creativeness to melodrama. During his long career as a poetic dramatist and particularly in his capacity as court poet in Vienna, he launched his writings—heroic and solemn in form and almost idyllic and Arcadian in substance—upon the European stage. His original, poetic world, formed of shadowy delicate sentiments, lent itself to song and music and expressed the sensibility of the first half of the 18th century, a period at once classical and "rococo." Outstanding among his numerous works are those of greatest lyrical inspiration, *Olimpiade*, *Didone abbandonata*, *Demofonte* and *Demetrio*.

Comedy.—Comedy, a literary form practised by many writers of the Renaissance, attained dignity in Lodovico Ariosto's plays, which in his day were well known and widely produced, particularly in France. Ariosto began by imitating Plautine and Terentian models (*La Cassaria*, 1508, *I Suppositi*, 1509) but his comic inspiration gradually improved in *Il Negromante* (1520) and in *La Lena* (1528), both of which were lively and richer in the poetry of daily life to which the contemporary scene at Cremona and Ferrara was very much more suited. It cannot, however, be said that any of the comedies in the Ariostian manner reach great artistic heights, not even the famous *La Calandria* by Bernardo Dovizio di Bibbiena (1513), in spite of his spirited superficial wit and gay, carefree sensuality. More vivacious and poetic were the comedies of Pietro Aretino (*Il Marescalco*, *La Cortigiana*, *L'ipocrito*, *Talento* and *Filosofo*, written between 1525 and 1542).

The use of material taken from classical and contemporary sources, including the *novelle*, and complicated themes from Plautus and Terence, and the interweaving of these elements with liveliness and wit, was the road indicated by Ariosto and followed

more or less by every playwright. As examples we have *La Gelosia*, *La Spiritata* and *La Pincocchera* by A. F. Graziani ("Il Lasca"), *Il Ragazzo* by L. Dolce, the work of the most able of them all, G. M. Cecchi (1518-87), who, known particularly for his *Assoluto*, enriches his comedies with the most characteristic forms of the spoken Florentine tongue, and the comedies of the Neapolitan G. B. della Porta (c. 1535-1615), *I Fratelli rivali* and *Trappolara*, which in their merry exuberance seem to be the forerunners of the *commedia dell'arte*. However, the only important comedy of the century is *La Mandragola* (c. 1520) by N. Machiavelli (1469-1527), within the framework of the usual plot of adventure and bawdy intrigue, the author of *Il Principe* created a masterpiece of profound psychological meaning and theatrical competence. Perhaps worthy of special mention are two anonymous comedies *Gli Ingannati* (1531), a theme later used by Shakespeare in *Twelfth Night*, and *Veneziana*, written with sincerity and feeling in a mixture of pure Italian and dialect.

It was through actor-playwrights such as the Paduan Angelo Beolco, nicknamed "Il Ruzzante," and the Venetian Andrea Calmo that in the middle of the 16th century, the *commedia dell'arte* was born, although it was in the following century that it became widely known throughout Europe. This type of drama was entirely dependent upon the skill and inventiveness of the actors, as the "writers" contributed only a brief outline and a summary description of the play, in such a way that it lost the character of a literary work and became predominantly a spectacle relying on scene setting, performance and make-up, it exercised an enormous influence on the European theatre.

In the 18th century, when the *commedia dell'arte* was practically reduced to an uninteresting, outworn fashion, the Italian comic theatre attained a new moment of greatness in the works of the Venetian writer Carlo Goldoni (1707-93), whose instinctive taste and vocation for the theatre was combined with creative originality. He was able to draw upon the small Venetian world to find subjects for his plays, which he invested with poetry of joyous yet tranquil rhythm, set off by characters in harmony with their social background, in a good-tempered, exquisitely 18th century comedy of manners. Goldoni brought a new dignity to comedy and also developed the construction of his plays from that of the *commedia dell'arte*. He abolished the conventional, immobile masks and wrote his plays in full, thus preventing the interpolation of vulgar improvisations arising from the actors' whims. Works which stand out among Goldoni's prolific output are those in which the social setting in all its pleasing variety shares the limelight with the characters. Examples range from *La Bottega di caffè* to *Il Campiello* and from *I Rusteghi* to *Le Baruffe chiozzotte*. Count Carlo Gozzi (1720-1806), in competition with Goldoni and in order to demonstrate that public taste could still appreciate the fanciful, traditional form, created the *fiabe drammatiche* or fairy tales (*Turandot* and *L'Angelini beverde*) which so much pleased Goethe and the German romantics by their popular, whimsical tone.

The Modern Theatre—After the romantic period, in which Manzoni's tragic drama was matched by works of civic and patriotic interest, realism and naturalism made their first attempts to assert themselves. Examples of this new movement are *Nerone* (1871) by Pietro Cossa and *I martiri* (1865) by Achille Corelli. At that time the theatre concerned itself with social problems, with dialectical or problem plays of psychological and historical content. Such plays had made their appearance in the comedies of P. Ferrari, *Il Duellino* and *Le Due dame*.

In the period of *verismo*, the bourgeois plays of G. Rovetta, M. Praga, C. Bertolazzi, G. Antona Traversi and Giacosa (*Tristi amori*, 1887, *Come le foglie*, 1900) alternate with dialectal works in which Vittorio Bersezio of Turin (*Le miserie di Monsù Travet*), the Venetian G. Gallina (*La Fiamma del santalo*) and, above all, the Neapolitan S. di Giacomo (*O' voto*, *Mese Marano*, *Assunta spina*) distinguished themselves. In his few dramatic works (*Lavarella Rusciana*, 1883, *La Lupa*, 1895) Giovanni Verga (1840-1922) revealed his strong sense of theatre and created an intensely poetic world which found its chief expression in his work as a novelist.

In the early 20th century comedy of the bourgeois type seemed, under the influence of the French theatre, in process of being supplanted by a romantic drama which suited the decadent taste of the period. An example of this is the eloquent but weak contribution of Gabriele d'Annunzio (1863-1938), from the plays which glorified the Nietzschean superman (*La Città morta*, 1898, *La Gioconda*, 1899, *La Gloria*, 1899) to the rich historical reconstruction of *Francesca da Rimini* (1902), *Pu che l'amore* (1900), *La Nave* (1908), *Le Martyre de Saint Sébastien* and *La Pisanella* (the latter two in French), and the solitary masterpiece, *La Figlia di Jorio* (1904), in which d'Annunzio returned to picturesque pastoral myths for his inspiration. Both Sem Benelli (*La Cena delle Beffe*, 1909) and the more decorous E. L. Morselli, with his *Orione* (1911) and his *Glauco* (1920), in spite of obvious differences, can be considered to have come under d'Annunzio's influence. But the real dramatist of the modern Italian theatre was Luigi Pirandello (1867-1936), who, after a long career as a writer of short stories and novels, met with his greatest success in the theatre. Three plays—*Il Giuoco delle parti*, *Sei personaggi in cerca di autore* (1921) and *Enrico IV* (1922)—represent the peak of his dramatic achievement and in one way or another influenced the whole theatre of the time. The torment of his characters, who live in hopeless solitude vainly trying to discover the meaning of their lives, his rapid and violent style and his peculiar dramatic technique, far removed from traditional forms, gave Pirandello's plays a pre eminent position in the Italian theatre.

After Pirandello's contemporaries, Rosso di San Secondo with his *Marionette, che passione!* (1918), L. Antonelli with *L'Uomo che incontrò sé stesso* (1918), L. Charelli with *La Maschera e il volto* (1917), mention may also be made of M. Bontempelli, S. Landi, U. Butti and Eduardo de Filippo.

Credit for the vitality and greatness of the modern Italian theatre must also be given to the actors who, in the 19th and 20th centuries, performed on the Italian stage and abroad, among whom were Eleonora Duse, Adelaide Ristori, G. Modena, Ermete Novelli, R. Ruggieri, T. Salvini and E. Zaccari.

GERMAN DRAMA

The dramatic literature of Germany, in the beginning intimately connected with the Reformation, soon fell under the domination of foreign models. It was not until the middle of the 18th century that Germany developed a national drama of comprehensive character.

As in other European countries, dramatic activity sprang from religious sources and was particularly connected with the Christian holidays. For a long time, Latin and German plays ranged side by side. The former were cultivated by the humanists of whom Jakob Wimpfeling (1450-1528) and Johann Reuchlin (1455-1522) were the most prominent. In the age of the Counter Reformation, the Jesuits developed the Latin drama, particularly in the form of the school drama. The secular German drama, on the other hand, was first cultivated by the civic guilds. It found its first outstanding author in Hans Sachs (1494-1576), the immortal shoemaker of Nuremberg, whose *Fasnachtsspiele* (Shrove-tide plays), which he wrote in addition to numerous tragedies and comedies, abounded with a vigorous, if rather crude, humour.

Toward the close of the 16th and the early years of the 17th century, theatrical activities fell almost entirely into the hands of the "English comedians" who, with their crude representations of Elizabethan dramatists, called forth imitations by native authors. Among them, the most prominent were Jakob Ayer (d. 1605) and, later on, Andreas Gryphius (1616-64), who devoted himself chiefly to the imitation of English or Dutch tragedy and comedy.

The Thirty Years' War and its aftermath proved disastrous to the drama, as to all other cultural activities, and produced a

vacuum of nearly 100 years duration. The German buffoon, known as Hans Wurst, Pöckelhering, Harlekin, etc., and modelled on the English fool, ruled the stage, while in serious drama blood curdling and pompous *Haupt- und Staatsaktionen* (high matter of state dramas) were the fashion. From this state, the German drama recovered only at the beginning of the 18th century. The honour is due mainly to the reformatory zeal of the Leipzig professor Johann Christoph Gottsched (1700-66), who, in collaboration with Karoline Neuber (1697-1760), the director of a theatrical company, abolished the Harlekin and put an end to the chaos of the existing stage. These endeavours he modelled on French tragedy and comedy, and himself supplied a tragedy, *Der sterbende Cato* (1731). The Leipzig school exercised a lasting effect on the art of acting, and before long produced in Konrad Ekhof (1720-78) an actor of distinction.

Lessing—Among the authors contributing to Karoline Neuber's enterprise was Gotthold Ephraim Lessing (1729-81), the first eminent figure in the history of the German drama. In his *Hamburgische Dramaturgie*, a running commentary on the efforts of the first national German theatre, established in Hamburg in 1767, he overthrew the domination of French classicism in favour of the English drama, above all, of Shakespeare. His own *Miss Sara Sampson* (1755) introduced the realism of English domestic drama to Germany. Then, in his *Missa von Barnhelm* (1767), he created one of the few great comedies of the German theatre, drawn from real life and appealing to patriotic sentiments. His third major work, the prose tragedy *Emilia Galotti* (1772), reflected the newly awakened pride of the rising middle classes and their struggle against the arbitrary rule of absolutism. In his last drama, *Nathan der Weise* (1779), he turned from prose to blank verse, thus pointing the way to the subsequent classical period of German drama.

The note sounded by Lessing met with a ready response. In Vienna, as in several other cities, national theatres came into being. The great actor Friedrich Ludwig Schröder (1744-1816) was the first to introduce Shakespeare in his true shape to the German stage. The translation of Shakespeare, begun in 1762 by Christoph Martin Wieland (1733-1813), and completed in 1775 by J. J. Eschenburg, though in prose, acted as the most potent stimulus on German dramatic literature. It was under the star of Shakespeare that a new generation of writers, known as *Sturm und Drang*, arose who worshipped their idol as the representative of "nature" in the theatre. The name of this group was derived from a play of one of their leading members, Friedrich Maximilian von Klinger (1752-1831). Beside him, the ill-starred young genius of J. M. R. Lenz (1751-92) was the most significant, other members were H. L. Wagner (1747-79), J. A. Leisewitz (1752-1806) and F. Müller, the "painter" (1749-1825). Though excessive in passion, and chaotic in form, this movement reflected the intellectual upheaval preceding the French Revolution.

Goethe—It was from the midst of *Sturm und Drang* that the greatest of German poets, Johann Wolfgang von Goethe (1749-1832), took his departure with his first play *Götz von Berlichingen* (1773). Both by its original treatment of a theme from German history, and by its vigour and disregard of form, it destroyed the last remnants of theatrical conventions which Lessing had still respected. Goethe's two succeeding plays, *Clauvigo* and *Stella*, are more of biographical interest than they are important contributions to the stage, whereas *Egmont* (1788) stands as a worthy

Schiller—Friedrich von Schiller's (1759-1805) genius, unlike Goethe's, was naturally and consistently suited to the clumps of the theatre. His juvenile works, *Die Räuber*, *Fuoco* and *Kubak* and *Liebe* (1781-84), vibrating under the influence of an age of social revolution, combined in their prose form the truthful expression of passion with considerable extravagance. But Schiller gradually emancipated himself from his earlier style, and with his earliest tragedy in verse, *Don Carlos* (1787), the first period of his dramatic authorship ends. The works of his maturity, from the *Wallenstein* trilogy (1798) to *Wilhelm Tell* (1804), are the acknowledged masterpieces of the German poetic drama, treating historic themes of various nations and clothing their dialogue in a noble vestment of rhetorical verse.

The joint efforts of Goethe and Schiller for the Weimar stage were important in many respects for the German drama. For a long time, however, popular taste favoured authors of a very different order. It oscillated between imitations of *Götz*, the so-called *Ritterdramen* (plays of chivalry) and *Rührstücke* (sentimental melodramas). The most successful authors in this field were the actor August Wilhelm Iffland (1759-1814) and the prolific August von Kotzebue (1761-1819), whose production ranged from the domestic drama and comedy to attempts to rival Schiller in verse.

The Romantic Movement—Meanwhile the so-called romantic movement of German literature had sprung up. To two of its leaders, Ludwig Tieck (1773-1853) and August Wilhelm von Schlegel (1767-1845), Germany owed its classical translations of Shakespeare and other great foreign dramatists. But their predilection for lyricism prevented them from creating an original drama of their own. Only a feeble outgrowth of the romantics achieved temporary success—the "destiny dramatists," among whom Zacharias Werner (1768-1823) and Adolf Müllner (1774-1829) were the most popular. They were in their turn satirized by August, Graf von Platen Hallermünde (1796-1835). It was with a play of this kind, *Die Ahnfrau* (1817), that the Austrian dramatist Franz Grillparzer (1791-1872) began his career. In his mature works, he earned on the classical tradition, treating themes from ancient Greece and subjects from Austrian history. Three dramatists of great power and promise, loosely connected with the romantic movement, succumbed to a premature death. Heinrich von Kleist (1777-1811), who produced his masterpiece with the Prussian drama *Der Prinz von Homburg* (1810), the extravagant Christian Dietrich Grabbe (1801-36), and Georg Buchner (1813-37), whose tragedy *Woyzeck* anticipated the modern social drama. The latter showed, together with Karl Gutzkow (1811-78), Gustav Freytag (1816-95) and Otto Ludwig (1813-65), a distinct trend towards realism. In Austria, Friedrich Halm (Eligius F. J., Freiherr von Münch-Bellinghausen) (1806-71), Eduard von Bauernfeld (1802-90) and, in the domain of fairy play and farce, Ferdinand Raimund (1790-1836) and J. Nestoy (1801-62) were names of literary mark, and a little later Ludwig Anzengruber (1839-89) imparted a new significance to the Austrian peasant drama. About the middle of the century the drama culminated in Friedrich Hebbel (1813-63), who combined masterly classical form with a psychological insight which pointed to the future.

The 25 years following the death of Hebbel, which saw the establishment of the new German empire, were remarkably poor in original dramatic production. The outstanding events in the theatrical field were the inauguration of Richard Wagner's Bayreuth theatre by his *Der Ring des Nibelungen* in 1876, and the stage of Duke Georg of Saxe-Meiningen (between 1874 and 1890), which reached an unprecedented standard of ensemble play. Finally, the opening of the Deutsches Theater in Berlin (1883), under the direction of Adolf L'Arronge (1838-1908), heralded a new epoch of the German drama.

Naturalism and Symbolism—Under the influence of French and Scandinavian realism, particularly of Ibsen, a new dramatic movement sprang into existence in the 1890s, known as naturalism, which was chiefly devoted to social drama. It was inaugurated by Gerhart Hauptmann (1862-1946) with his first play *Vor Sonnenaufgang*, and by Hermann Sudermann (1859-1928) with his *Die Ehre*, both produced in 1889. With them were associated a

spheres of thought and experience. A noun dramatic in form, thus truly world-embracing poem transcends the limits of drama in its accepted sense.

number of young playwrights such as Max Halbe (1865-1944), O. L. Hartleben (1864-1905) and Georg Hirschfeld (1873-1939). While all these had soon spent their forces, Hauptmann held the stage throughout his long life. After his stirring social drama *Die Weber* (1892) and his excellent comedy *Der Biberpelz* (1893), he turned to more poetic themes (*Die versunkene Glocke*, 1896). From then onward, he alternated between realistic plays and poetic drama, maintaining his position as the foremost German dramatist down to his final tetralogy of the *Atrides* (1941-44).

Whereas the naturalistic movement was mainly centred on Berlin, there sprang up in Vienna a reaction which cultivated the poetic and symbolic drama. Its declared leader was Hugo von Hofmannsthal (1874-1929), who earned world fame after World War I through the Salzburg festivals to which he contributed his religious play *Jedermann*. Other Austrian dramatists of distinction were Hermann Bahr (1863-1934), Arthur Schnitzler (1862-1931), Anton Wildgans (1881-1932) and Karl Schönherr (1867-1942), who attained wide popularity with his dramas of peasant life, notably *Glaube und Heimat* (1911).

Expressionism and After—At the turn of the century, Frank Wedekind (1864-1928), with his startling and grotesque plays, and Karl Sternheim (1878-1943), with his caustic satires on bourgeois morality, prepared the way for the so-called expressionist movement. It attained its peak, inspired by fervent pacifist views, at the end of World War I. Its foremost representatives were Georg Kaiser (1878-1945) and Ernst Toller (1893-1939). The former, an exceedingly prolific writer, gave the movement such characteristic plays as *Die Burg von Calais* (1914), *Von Morgens bis Mitternachts* (1916) and the trilogy *Gast* (1918-20), while Toller's most significant contributions were the antiwar play *Die Wandlung* (1916) and *Masse Mensch* (1921). Other expressionist dramatists of distinction were Reinhard Sorge (1895-1916), Walter Hasenclever (1890-1941), Reinhard Goering (1887-1936), and with his naval drama *Seeschlacht* (1917), and Fritz von Unruh (1885-).

The storm of expressionism soon blew over and gave way to a more solid, realistic form of drama. In the middle of the 1920s, a new set of writers emerged, the most promising of whom were B. Brecht (1898-) and C. Zuckmayer (1896-). After 1933, the ruthless policy of the Nazis deprived Germany of most of her best playwrights. The destruction wrought in World War II left German theatrical life in a state of chaos from which it was slow to recover.

The German theatre during the first part of the 20th century attained an unsurpassed standard, largely because of the example of Max Reinhardt (1873-1943), whose productions included the whole range of dramatic literature, both classical and modern. In the early 1920s a new style of production, adapted to expressionist drama, was introduced by L. Jessner (1878-1945), E. Piscator (1893-) and others, who were strongly influenced by, and in their turn influenced the Russian revolutionary theatre. After World War I the numerous court theatres were transformed into state or municipal theatres. In addition, co-operative undertakings, so-called Volkshäuser, sprang up, based on small annual contributions of their members. These subsidies of various types made the German theatres less dependent than those in other countries on the speculative commercial manager and the success or failure of individual plays.

BIBLIOGRAPHY—The most comprehensive history of the German drama is *Das deutsche Drama*, ed. by R. F. Arnold (Munich, 1925), of German comedy, K. Holl, *Geschichte des deutschen Lustspiels* (Leipzig, 1923), and of German tragedy, B. von Wiese, *Die deutsche Tragödie*, 2 vol. (Hamburg, 1948).

DUTCH DRAMA

The oldest extant specimens of Dutch mediaeval drama date from the end of the 14th and the beginning of the 15th centuries. The 16th century is the century of the morality or *Spel van Sinnen*, which is the typical rhetoricians' play, and in which all, or nearly all, the characters are allegorical. One of the earliest and most beautiful of these moralities, *Elckerlyc* (*Everyman*), is still per formed.

The so-called "golden century" was the summit of the Renaissance and a most important period in the history of Dutch drama. Gerbrand Adriaanszoon Bredero (1585-1618) displayed his original talent in comic interludes which he expanded into farces. Pieter Cornelissen Hooft wrote, mainly under the influence of Seneca, such plays as *Achilles en Polyxena*. The greatest Dutch dramatist, however, is Joost van den Vondel, the author of 32 dramas, of which 24 are original. (See DUTCH LANGUAGE AND LITERATURE.) His preference was for the treatment of stories from the Bible and his finest play was *Lucifer* (1654), which shows a considerable resemblance to Milton's *Paradise Lost*.

At the end of the 17th century there were a few poets who wrote *comédies de mœurs*. Meanwhile the time of the Dichtgenootschappen (poetic societies) had arrived. Their entire theory of art consisted in recommending the imitation of French classical drama. The comedies of Pieter Langendijk, a disciple of Molière, represented something of higher value. After 1760 French middle class drama was extensively translated and copied in the Netherlands. In the 19th century romanticism triumphed on the Dutch stage in the works of Hendrik Jan Schimmel (1833-1906), who wrote, among other plays, *Twée Tudors* and some patriotic dramas. A play *Vorstenschol* (*The School for Princes*) by Edward Douwes Dekker, one of the greatest Dutch writers, better known under the pseudonym of "Multatuli," made a sensation when it appeared in 1872.

Representative of modern drama in the Netherlands are Marcellus Emants, a pessimist, *fin de siècle* figure, one of whose most satisfying works is *Domdoodsmacht* (*The Power of Stupidity*), Frederik van Eeden, Henriette Roland Holst, who wrote in 1912 a verse drama *Thomas More* which was first performed in 1949, Mrs J. A. Simons Mees, who brought to the stage of the psychological conflicts of modern life, and Herman Heyermans, a Socialist in revolt against the bourgeoisie, who gained recognition far beyond his native frontiers. Other notable contributions are *De Pantserkrant*, Menno ter Braak's satire on armaments trusts, and Muntz Dekkers' later plays. The dramatic work of the best-seller writer J. van Hartog attracted attention in Great Britain and the United States. A Defresne, Ben van Eysseltseyn and Ary den Hertog were among authors who devoted themselves more or less exclusively to writing for the stage.

DANISH DRAMA

In Danish drama the 16th century was the time of the school comedies, among which the best is H. J. Ranc's *Karrig Nidding* (c. 1600). In the 18th century Denmark's first and foremost dramatist, Ludvig Holberg, Baron Holberg (see *Norwegian Drama*, below), was influenced by Molière, but his vivacious and witty dialogue and brilliant characterization were highly original. His comedies were performed at the time of the opening of the first Danish theatre (1722). Of Holberg's 33 comedies the first 15 (written 1722-33) are comedies of character, and among them are his masterpieces, *Jeppe on the Hill*, *Erasmus Montanus* and *The Political Thinker*. They are witty social satires, reflecting the life of the peasantry, the undergraduates and the middle classes of Holberg's own time. From 1723 to 1727 Holberg wrote 11 comedies of manners, in which he made use of a set of typical figures corresponding to those of the *commedie dell'arte*.

As a dramatist, Johannes Ewald heralded the new romantic

movement, brought in new subjects and struck a new note in his serious dramas. In *The Death of Balder and Rolf Krag* he introduced subjects from Nordic mythology and from Saxo Grammaticus, and in *The Fishermen* (1778) he struck a new patriotic note and made humble fishermen the heroes of his drama. Adam Oehlenschläger is, however, the most representative figure of Danish romantic drama. Like Ewald he was influenced by Shakespeare, but also by Schiller and Goethe. Among his plays *Sanct Hansaften-Spil* (1802), *Aladdin* (1805), *Hakon Jarl* (1807) and *Baldur den Gode* (1807) are of great lyric beauty and declamatory power, richly imaged in language. J. L. Heiberg transplanted the French vaudeville into Danish soil and, in addition to his charming musical plays, wrote some serious romantic dramas. Henrik Hertz also wrote entertaining middle class comedies and farces and two important romantic dramas, *Svend Dyrings House* (1837) and *King René's Daughter* (1845). Holger Drachmann, though mainly a lyrical poet, contributed some lyrical dramas of high quality. Toward the end of the 19th century the realistic drama is represented by Gustav Viedt, whose bitter and cynical plays were a reaction against the prevalent romantic dramas.

A revival of the modern Danish drama was made by the two most prominent dramatists of the 20th century, Kaj Munk and Kjeld Abell. The dramas of Kaj Munk revive Shakespearean, heroic motives and are mostly religious, as *An Idealist or The Word*, and occasionally also political, as *He Sits at the Melting Pot*. The plays of Kjeld Abell are antinaturalistic and influenced by modern French drama, and discuss the fundamental problems of modern man (*Anna Sophie Hedvig* and *Days on a Cloud*).

NORWEGIAN DRAMA

The Norwegian drama, which reached a zenith in the plays of Ibsen, is the most vigorous revelation of the mind of a nation that has occurred in recent times. It is no sudden growth, but rather a natural development of the Norwegian genius which first manifested itself in the national folklore. The chief characteristics of both are a spirit of individual independence tempered with good humour and considerable self reliance. For the latter, the natural difficulties of the country, with its secluded community life, must be held responsible.

The drama, as a special branch of art, was unknown in Norway almost up to the 19th century, and there existed none of the elements that are required for the growth and prosperity of a national drama. The country possessed no reigning court and no wealthy nobility, nor was there, with the single exception of Bergen, any town in Norway that possessed sufficient vision to lay the foundations of dramatic art of the future. In Bergen was born Ludvig Holberg, Baron Holberg (q.v.) (1684-1754), one of the greatest dramatists of all time and the founder of modern Norwegian and Danish literature. Because Norway was too impoverished to support a considerable intellectual and cultural life, Holberg took up his abode in Denmark. After Holberg, Johan Herman Wessel (1742-85) should be mentioned. His well known burlesque *Love without Stockings* remained popular, despite the fact that the school of tragedy against which it was originally directed had long since ceased to exist.

Notwithstanding the basis of drama laid by Holberg and Wessel it need hardly be said that a national drama in the true sense of the word could exist only after the dissolution of the union with Denmark in 1814. By this event Norway became once more possessed of the sovereign liberty necessary for the evolution of an independent culture, yet more than a generation had to elapse before the first national theatre was founded in Bergen in 1850. This theatre, which was the result of the initiative of Ole Bull (1810-80), an art enthusiast and one of the foremost violinists of Europe, marked the first step in the direction of an exclusively Norwegian stage. At that time the Christiania theatre, which had opened in

1837, had an entirely Danish personnel. Though the Bergen theatre numbered Ibsen and Bjørnson among its managers, it was eventually forced to close, overburdened with financial difficulties. Despite its defeat, the National Stage of Bergen, still the official name of the Bergen theatre, had proved the possibility of a Norwegian theatre, and after a struggle lasting for a number of years a national theatre was established at both Bergen and Christiania.

Meanwhile Henrik Ibsen (q.v.) (1828-1906) and Bjørnsterne Bjørnson (q.v.) (1832-1910) had come to the front in Norwegian literature in the late '50s, and within less than ten years they both produced a number of dramatic works of rare value.

From the beginning of the '70s, a change came over Norwegian literature that was to exercise a considerable influence over Ibsen and Bjørnson. The chief characteristic of this period was its pronounced realistic spirit which produced the modern social drama. The dramas of Ibsen and Bjørnson were not only stamped with the keen intellect and the intense sensitiveness of their creators, but they represented the supreme attainment of European culture at the moment.

Next to Ibsen and Bjørnson, Gunnar Heiberg (1857-1929) must be mentioned. The chief characteristic of his drama is the sharp and trenchant dialogue, but with the exception of *The Balcony* (1894) and *Love's Tragedy* (1904) his plays can scarcely be considered lasting works of art. These two plays, in which he showed love as a destructive force of nature, overwhelming in its consequences, will always bear witness to his talent. Unfortunately Heiberg did not develop as a dramatic author, and as a whole the Norwegian drama after Ibsen and Bjørnson followed more fortuitous lines. This applied, by way of example, to *The Happy Election* (1914) by Niels Kjaer (1870-1924), in which this author, considered one of the most accomplished writers of modern Norwegian prose, dealt with certain contemporary phenomena of Norwegian politics, among them the language question, in a very clever and realistic way. Another example was Oskar Braaten (1881-1939), who scored great success on the stage with his comedies *The Kid* (1911) and *The Wholesome Christening* (1925), written in the characteristic language of the industrial population in the vicinity of Oslo and dealing with its life and manners. A dramatist of an entirely different type was Hans E. Kinck (1865-1926), whose remarkable drama *The Cattle Dealer* (1908) was, in the opinion of many critics, unvalued in Norwegian literature since Ibsen's *Peer Gynt*.

Prominent among playwrights in the first half of the 20th century were Helge Krog (1886-) and Nordahl Grieg (1902-43). Krog's best-known works, *On the Way* and *Break-Up*, are clearly reminiscent of the Ibsen-Heiberg tradition, with their incisive style and merciless analysis of character. Grieg's haunting dramas, while endeavouring to adapt Russian technique, portray the conflicting national tendencies of the period between World Wars I and II. In *The Defeat* (1938), however, Grieg went back to the days of the Paris commune for his material, a choice obviously influenced by the European crisis.

SWEDISH DRAMA

The first extant Swedish plays date from the Reformation of these the naive biblical drama *Tobias Comedia*, attributed to Olaus Petri (1493-1552) is the best known. A didactic tendency still marks the drama well into the 17th century (for instance, the formless works of Johannes Messenius [1579-1636]), but in Magnus Asterophorus *Tysbe* (first performed in 1609) a desire to entertain is also found. Skill in versification, rather than dramatic quality, is to be found in the masques of Georg Stjernhelm (1598-1672). As yet no professional theatre existed. Urban Hjärne's (1641-1724) *Rossumda* (first acted in 1665), written for a company of Uppsala students, was the first Swedish attempt at a classical tragedy. Imitations of the latter genre dominated the Swedish drama throughout the 18th century, interest in

In a European sense the theatre began during the reign of Alexey Mikhailovich under a certain Gregory, whose productions on biblical themes took place in Moscow in 1672. The real father of the Russian theatre proper was Fedor Volkov (1729-63). The continuous output of original drama begins with the production of the first tragedy in the French style by Alexander Sumarokov (1717-74) in the Russian court theatre, established by Elizaveta Petrovna in 1747. This style dominated tragedy as well as comedy, with playwrights such as Yakov Knyazhin (1742-93) and Alexey Khomyakov (1804-60). Catherine II herself wrote plays.

From classicism the theatre moved through the melodrama to realism, as seen in the work of Denis Fonvisin (1744-92), *The Brigadier*, *Nedorosl*, the first significant comedy writer. Fonvisin's realistic satire culminated in the great comedy of Alexander Griboyedov (*q v*) (*Woe from Wit*) and the still greater plays of Nikolai Gogol (*q v*) (*The Inspector General*, 1836). Gogol was the first playwright to introduce plot as well as character driving, he was also a master of dramatic construction and the first to lend more importance to the producer's task. His tradition was continued by Alexander Sukhovo-Kobylin (1817-1903) (*Wedding of Krechinsky*, *Death of Tarelkin*) and Alexey Pisemsky (*q v*), whose *A Bitter Fate* is a realistic tragedy of great power. The historical drama in verse after the Shakespearean model as introduced by Alexander Pushkin (*q v*) and Mikhail Lermontov (*q v*)—strongly influenced by Schiller—and had a good exponent in Alexei Konstantinovich, Count Tolstoy (*q v*), whose work, however, is reminiscent of operatic pageants. The great Alexander Ostrovsky (*q v*) devoted himself exclusively to the drama, his best plays being *The Storm* (1866) and *The Forest* (1871). Because of his efforts the Russian drama alone in Europe was free from the dictatorship of Augustin Scribe. He symbolizes the Russian theatre's coming of age, but, like most Russian playwrights, he neglects the plot and concentrates on character. To this same period belongs Ivan Turgenev's (*q v*) *A Month in the Country* (1866), a psychological comedy. Count Leo Tolstoy (*q v*) wrote plays in his later years, but the *Power of Darkness* (1889), *The Fruits of Enlightenment* (1891) and *The Living Corpse* (1911) are dramatized novels more than plays. After Tolstoy naturalistic realism was continued by Maxim Gorky, as in his masterpiece *Na Dne* (*The Lower Depths*, 1903), *Yegor Buhachev* and *The Others*, produced 30 years later, is composed on a different, less fatalistic, formula. Mikhail Artsybashev (*q v*), made an attempt to bring eroticism to the stage in *Jealousy* (1913), but had not much success. Ilya Surguchev (1882-) tried in 1914 to revive the psychological drama in *Autumn Visions*.

Anton Chekhov (*q v*) started writing for the theatre in 1884, but his fame reached its peak with the production of *The Seagull* by the Moscow Art theatre in 1898. His real strength comes from his mastery of laughter, though sadness is also an inherent part of his being. His one-act plays are essential for the understanding of his full-length dramas, *Ivanov*, *Uncle Vanya*, *The Seagull*, *The Three Sisters* and *The Cherry Orchard*. He wrote his plays in prose, yet the epithet "poetic" applies to them more. He continued the tradition of Turgenev in eliminating the element of plot and removing all theatrical effect. Stanislavsky's (Constantine Sergeevich Alexeev, 1863-1938) (*q v*) absolute subordination of the actor to the producer was well suited to Chekhov's theatre. Chekhov marks the decline of Russian realistic drama, essentially static and lacking in logical unity.

Leonid Andreyev (*q v*) and Nikolai N. Yevreinov (1879-) both tried to release the stage from the incubus of realism. Andreyev was the first to introduce symbolism on the stage in *The Life of Man* (1907), *Days of Our Life* (1908) and *He Who Gets Slapped*, but too much sentiment enters into the would-be tragedy. Yevreinov exploited the theatrical and was inclined toward the comic, even if the comedy was often bitter. Even more clearly is that mirrored in the poetic dramas of Alexander Blok (*q v*), where the play of imagination mingles with satirical laughter and ironic fancies (*Balaganchik*, 1906, *The Stranger*, 1907, *The Rose and the Cross*). Fedor Sologub (*q v*) belongs to the same school.

The main movement after that was represented by the producers Vsevolod Meyerhold (*q v*), Alexander Tairov (1892-

1923?), Evgheny Vakhtangov (1880-1922) (the Hebrew theatre) and Alexander Granovsky (1877-1915?) (the Yiddish theatre), and consisted in the desire to "deliteralize" the stage. The play tended to become a matter of pure show. After 1917 the revolutionary ideas at first allied themselves with literary futurism, but the futurist drama produced only the excellent *Mystery Bouffe* of Vladimir Mayakovsky (1893-1930) and the propaganda plays of Sergey Tretyakov (1893-7), *Roar China*. The official bolshevik drama was represented by Anatoly Lunacharsky (*q v*) but soon approached the true spirit of tragedy in the plays of pure action of Leo Lunts (1901-24) (*Outlawed*, 1921). There followed a series of plays about the Red army during the civil wars—*The Armoured Train* by Vsevolod Ivnov (1895-1949), *Chapayev* by Dimitry Furmanov (1891-1926), Mikhail Bulgakov's (1891-1940) *Days of the Turbines*, Alexander Korneychuk's (1905-) *Wreck of a Squadron*, Alexey Nikolayevich Tolstoy's (1882-1945) *Path to Victory* and L. Rakhmanov's *Professor Poleshchayev*. As Stanislavsky said, it was an overhauling of the old, a seeking for new paths. A new "Socialist realism" began to creep in as seen in a play by Nikolay E. Virla (1906-) , *Earth—conflict* between a peasant and a partisan. The vogue for the historical drama became marked and K. Trenev (1877-1945), a playwright whose work formed a bridge between past and contemporary drama, wrote *The Pugachev Rebellion*. In the early 1930s there was a return to the individual and his inner conflicts, of which the better exponents are Leonid Leonov (1899-) (*The Wolf, Orchards of the Polovits*), Alexander Afanogenov (1904-41) (*Fear*, showing the deep influence of Chekhov), Valentin Katayev (1897-) (*Squaring the Circle*) and, later, Nikolay Pogodin (1900-) , with a strong tendency to farce (*My Friend*). But though experimental forms found their freest scope in the U.S.S.R., drama had to be informative and propagandist, as shown in the work of Konstantin Simonov (1915-) (*The Russian People*). Labour, not love, becomes the central subject and beauty is seen within the limits of ideological struggle.

UNITED STATES DRAMA

The first specimens of dramatic writing in the United States, reflecting the tastes and tendencies of colonial and revolutionary life, showed definite English, with now and then suggestions of Teutonic influences. They were all imitative and have no interest today except as curios. Only two plays written by Americans were actually presented on the stage before the Revolution. *The Prince of Parthia*, a blank verse tragedy by Thomas Godfrey the younger, and *The Conquest of Canada, or the Siege of Quebec*, an attempt at historical drama by George Cocking. Neither contained a symptom of promise so far as native drama was concerned, nor was any discernible in the plays written by Americans in the period immediately after. Among these we have as outstanding examples the recreant Maj. Robert Rogers' blank verse tragedy *Pontecar*, or *The Savages of America*, a blank verse lampoon of certain Boston celebrities of the day, under the title *The Group*, written by Mrs. Mercy Warren (wife of Gen. James Warren), who had gained a measure of partisan notoriety previously with a play called *The Blockheads*, an answer to Gen. John Burgoyne's satiric farce, *The Blockade of Boston*, a patriotic play in blank verse, *The Battle of Bunker's Hill*, by Hugh Henry Brackenridge, another patriotic affair, *The Fall of British Tyranny*, by John Leacock, incidentally the first example of an American chronicle play and the first in which George Washington appeared as a character, and a comedy reflecting the political spirit of the time (c. 1798) called *The Politician Out Witted*, by Samuel Low, in which we have the earliest known instance of the local theatrical use of Negro dialect.

The beginning of what, though still somewhat euphemistically, may be termed the real American drama was synchronous with the active appearance on the American scene of William Dunlap, in many respects the father of the American stage, and Royall

Tyler The latter's comedy *The Contrast* (the second play written by an American to be produced in America by a professional company of actors, *The Prince of Parthia* being the first) was acted in 1787 and was the first dramatic work to introduce the character that has since become known as the stage Yankee. Written under the inspiration of *The School for Scandal*, it was also the first American play to achieve a box office success. Dunlap wrote or adapted about 60 plays, of which the best known is his blank verse tragedy, *André*, produced in 1793.

Among the more significant of their successors, at least in a historical sense, were James Nelson Barker, author of *The Indian Princess*, or *La Belle Sauvage*, the earliest play on the Pocahontas theme, converted into a libretto for a so called "operatic melodrama" and produced in 1803; Mordecai M. Noah, whose *She Would Be a Soldier*, or *The Plains of Chippewa*, a historical drama, was shown in 1819; Joseph Hutton, actor and playwright, author of *Fashionable Follies*, John Howard Payne, fabricator of such compounds as *Brutus*, or *the Fall of Tarquin* and *Charles the Second*, and Richard Penn Smith, author of the historical play dealing with the War of 1812, *The Triumph of Plattsburg*.

In the '30s of the 19th century there was much dramatic activity. Such things as George Washington Parke Custis' *Pocahontas*, or *The Settlers of Virginia*, Robert Montgomery Bird's *The Gladiator*, and *The Broker of Bogota*, John Augustus Stone's *Metamora*—all ranting opera written under the inspiration of the actor Edwin Forrest, Nathaniel P. Willis' *Torresia the Usurer*, written under the eye of James Wallack, for his own use, Joseph Stevens Jones' *The People's Lawyer* (with the unforgotten character "Solon Shingle"), and Robert F. Conrad's *Jack Cade*, another machine made Edwin Forrest vehicle, cleared the way for what may fairly be called the first American play of social manners—*The Contrast*, though a social satire, may be dismissed as negligible—and the first native comedy of even mild merit, namely, Anna Cora Ogden Mowatt's *Fashion*, written under the strong influence of Sheridan, and produced in 1845. This *Fashion*, which enjoyed success in England as well, marks what is practically the birth of a native drama, however modest, worth critical consideration. In the years following its presentation there came into being *Uncle Tom's Cabin*, dramatized from Harriet Beecher Stowe's novel by George L. Aiken, Mrs. Sidney F. Bateman's *Self*, Clifton W. Taylour's *Horseshoe Robinson*, the transplanted Dion Boucicault's *The Octoroon*, dealing with the slavery question, in 1859, Frank Mayo's *Davy Crockett*, the dramatization of Washington Irving's *Rip Van Winkle* by Joseph Jefferson, and, finally, Steele MacKaye's *Hazel Kirke* and *Paul Karver*.

Gradually, now, the U.S. drama began to move on feet of its own, instead of relying almost entirely upon foreign crutches. MacKaye revolutionized the mechanics of the American stage as he had found it and, with them, certain phases of its immaturity, at least as it had been practised. A new order of playwrights grew up. Among these, the first was Bronson Howard, the dominant dramatist in the U.S. theatre of his day. Howard is best known for his military melodrama, *Shenandoah*, based upon a work written 20 years before, subjected to several revisions and produced in the late '80s. Among his other plays were *Saratoga* (produced as early as 1870), *The Young Mrs. Winthrop*, *The Hemstreet* and *Aristocracy*. Foreign influences were clearly discernible in some of these, as well as in others that he wrote, but above them sounded a distinctly native note that was not lost upon U.S. audiences. The last decade of the century witnessed the abandonment of the European crutches to an even greater degree. William Gillette with his melodramas, *Held by the Enemy* and *Secret Service*, established U.S. drama as a thing of itself. James A. Herne, with his pioneer realism in *Shore Acres*, *Griffith Davenport* and *Sag Harbor*—to say nothing of *Margaret Fleming*—brought the U.S. drama even more positively into its own. Charles H. Hoyt, with his farces and comedies, brought American types and phases of American life bodily into the theatre. The movement was furthered by Clyde Fitch, with his commentaries on the lighter side of U.S. society, and by Augustus Thomas, with his series of so called "state plays," beginning with *In Mescotura*. Langdon Mitchell appeared with *The New York*

Idea. George M. Cohan, whose influence was to colour much of American dramatic writing for many years afterward, began to write musical pieces and later farces and comedies that were genuinely American, as also were George Ade's *The College Widow* and *The County Chairman*. William Vaughn Moody, with *The Great Divide* and *The Faith Healer*, took the drama into higher literary reaches. A half dozen artistically inferior but theatrically skilful playwrights such as Charles Klein, Eugene Walter and Edward Sheldon busied themselves with American types and themes and completed the divorce from European drama.

The foremost figure in U.S. drama during the first half of the 20th century was Eugene O'Neill, whose more notable works, such as *Strange Interlude*, *Mourning Becomes Electra*, *The Emperor Jones*, *The Great God Brown*, *Desire under the Elms*, *Beyond the Horizon* and *The Iceman Cometh*, show genuine dramatic force and literary merit. Among his contemporaries were men and women who were raising U.S. dramatic writing to a distinguished level. Maxwell Anderson and Laurence Stallings in *What Price Glory?* contributed to the stage a war drama of sweeping fire and devastating irony. George Kelly's *Craig's Wife* and to a lesser degree *The Show Off*, Paul Green's *In Abraham's Bosom*, Rita Wellman's *The Gentle Wife*, the comedies of Vincent Lawrence, Zoe Akins' *A Texas Nightingale*, S. N. Behrman's *Ram from Heaven*, Maurine Watkins' *Chicago*, Maxwell Anderson's *Saturday's Children*, Sidney Howard's *Lucky Sam*, McCarr, Frank Craven's *The First Year*, Arthur Richman's *Amphibious*, Elmer Rice's *Street Scene*, Hecht and MacArthur's *The Front Page*, John Wesley's *The Last Mile* were other examples of American playwrighting that called for the scrutiny of serious criticism. On a lower level, but rich in illumination of the American scene, there was a procession of comedies, farces and melodramas of striking originality and suggestive humour.

General economic depression reduced patronage of the legitimate theatre for several years in the 1930s and consequently, perhaps the incentive to writers of good plays. There continued, nevertheless, to be produced each year at least a few noteworthy additions to the national dramatic record. Among those deserving of mention were *The Green Pastures*, adapted by Marc Connelly from Oscar Bradford's book of sketches, *Tobacco Road*, adapted from Erskine Caldwell's novel by Jack Kirkland, *The Children's Hour* by Lillian Hellman, and Maxwell Anderson's drama in verse, *Winter set*.

A reflection of political and social disillusionment appeared in a new type of satirical musical show, *Of Thee I Sing*, by George Kaufman, Morrie Ryskind and George Gershwin.

BIBLIOGRAPHY.—The most complete survey is A. H. Quinn, *A History of the American Drama from the Beginning to the Civil War* (1923) and *A History of the American Drama from the Civil War to the Present Day* 2 vol. (1927), both works containing bibliographies and annotated lists of American plays. Commendable collections of plays giving a historic survey of the U.S. drama with biographical and bibliographical notes are: M. J. Moses (ed.), *Representative Plays by American Dramatists from 1765 to the Present Day*, 3 vol. (1918-27) and A. H. Quinn (ed.), *Representative American Plays, 1767-1923*, rev. ed. (1925). Margaret G. Mayorga (ed.), *Representative One-Act Plays by American Authors* (1919), and G. P. Baker (comp.) *Modern American Plays* (1920), are also helpful collections. Among the books on later U.S. drama are B. H. Clark, *The British and American Drama of Today* (1915), T. H. Dickinson, *Playwrights of the New American Theatre* (1925), and G. J. Nathan, *The Theatre of the Moment* (1936), *The Morning after the First Night* (1938), and the annual, *The Theatre Book of the Year* (1942 et seq.) (G. J. N.).

DRAMA AND THE STAGE, ARTICLES ON DRAMA as a whole is divided into the following sections: *Greek Drama*, *Roman Drama*, *Downfall of the Classical Drama*, *Chinese Drama*, *Japanese Drama*, *Indian Drama*, *Persian Drama*, *Medieval Drama*, *English Drama*, *French Drama*, *Spanish Drama*, *Portuguese Drama*, *Italian Drama*, *German Drama*, *Dutch Drama*, *Danish Drama*, *Norwegian Drama*, *Swedish Drama*, *Polish Drama*, *Czechoslovak Drama*, *Russian Drama*, *United States Drama*. In addition there are articles on subdivisions of the dramatic arts which will be found under their own headings. An article on **STAGE DESIGN** embodies the latest ideas on the subject, and other special articles worthy of mention are **COSTUME DESIGN**, **THEATRICAL**, **NO DRAMA**, **THEATRE**, **THEATRES**, **LAW RELATING TO**

DRAMATIC CRITICISM extends from dramatic theory on the one hand to theatrical criticism on the other. Its founder was Aristotle, whose *Poetics* (c. 335 B.C.) laid down miraculously for its time, the basis of all dramatic theory. His definition of tragedy as 'an imitation of an action that is serious, complete, and of a certain magnitude... in the form of action, not of narrative, through pity and fear affecting the proper purgation of these emotions' lies behind all subsequent discussion. For comedy the *Tractatus Coislinianus*, conjecturally related to Aristotle gives an analysis that can be supported from Aristophanes, Shkspere and Moliere. Roman theory is represented by Horace's *Ars Poetica* (c. 80 B.C.), a clever and superficial work suggesting 'good sense' entertainment combined with instruction and a five act division, as the road to success. Horace first, and Aristotle when he was accessible, formed the basis of Renaissance criticism, and ultimately of modern theory. Ancient dramatic criticism in action may be seen at its most amusing in Aristophanes' *Prologi*. Medieval theory was in the main concerned with the still popular formal distinction between tragedy with its unhappy, and comedy with its happy ending. Dante calls his epic a *Divine Comedy* because "in its beginning it is horrible and foul, because it is Hell, in its ending, fortunate, desirable, and joyful, because it is Paradise."

With the Renaissance the rediscovery of Aristotle's *Poetics* gave a new and hence life to dramatic discussion. A Latin translation by Giorgio Valla appeared in 1498, the *editio princeps* of the Greek text in 1508. Robertelli's critical edition in 1548, and an Italian translation, the first in any modern tongue, in 1549. Aristotle's cryptic lecture notes needed clarifying, and most commentators loyally interpreted, altered and expanded in accordance with contemporary theatrical conditions. Plays were composed on Aristotelian principles. Ludovico Castelvetro was the powerful and individual founder of the Renaissance neoclassical doctrine which survived until the Romantic movements of the mid 18th century. In his Aristotelian commentary of 1570 he insisted that plays must be acted and not read, that tragedy is concerned with kings and public characters, and comedy with low and private people, that tragedy might have either a happy or miserable end, as well as comedy, and in so doing he looked back, unwittingly, to Plato's concluding comment in his *Symposium* "that the genus of comedy was the same with that of tragedy." His farthest reaching contribution was the formulation of the doctrine of the three unities. Aristotle has only the unity of *action*, and a part of that of *time*. Castelvetro gave definite shape to the unities of *action*, *time* and *place*.

The Age of Shakespeare—On the threshold of the great national dramas of England and Spain, Renaissance theory was epitomized in Sir Philip Sidney's *Defence of Poesie* (1595) and in Cervantes' *Don Quixote* (1605). But the world of practice became insistent, and Shakespeare's point of view in England was matched by Lope de Vega's *New Art of Writing Plays* (1609) in which, on the experience gained from writing 483 plays, he put forward the first classic of box office criticism. "Since the crowd pays for the comedies, it is fitting to talk foolishly to it to satisfy its taste", give plenty of variety, let women wear men's costumes, keep up the suspense and mystery to the last scene, and don't bore your audience with pregnant silences. There is surprisingly little new criticism in the Elizabethans. Ben Jonson's is largely secondhand, and Shakespeare's advice on acting, bold and vivid as it is, has Italian forerunners.

With the 17th century, the age of criticism, important changes occur. In France, Jean Chapelain, the abbe D'Aubignac, Jean Racine, and above all Pierre Corneille, contributed to serious theory. Corneille, in his *Discours and Examen* of 1660, for which he claimed "50 years of practical experience of the theatre," took up the problems of decorum, verisimilitude and the three unities, which had already occupied Castelvetro, and gave them new and live interpretation. It was Corneille's alertness of mind and not his dull position, to please according to the rules, that stimulated John Dryden to write his *Essay of Dramatic Poesie* (1668) and his prefaces modelled after Corneille's *Examen*. Dryden, as befits an individual Englishman, was torn between the formalist

or 'good sense' view continued by Nicolas Boileau Despreaux and René Rapin in France, and John Milton and Thomas Rymer in England, and the sinner view based on practice of which he was perhaps the only representative. His views on tragicomedy and on character drawing by giving chapter and verse laid the foundation of modern criticism in England, and his definition of action forced shrouded something of Henrik Ibsen's attitude. For comedy, Moliere in his scanty utterances and William Congreve in his *Concerning Humour in Comedy* (1696) express urbanely what can be more robustly gathered from their works.

The 18th and 19th Centuries—With the decline of drama, adjacent criticism largely of morals and of theatrical art, becomes more insistent. Jeremy Collier's *Immorality and Profaneness of the English Stage* (1698) is an important landmark, and Collev Gibber's *Apology* (1740) contains some of our earliest and finest descriptions of acting. The 17th century was the age of the fashionable baroque theatre, the 18th the age of great or much applauded actors. Denis Diderot's *Paradoxe sur le comédien* (not published till 1830) and G. C. Lichtenberg's descriptions of David Garrick not only exemplify the interest in acting but together with G. E. Lessing's *Hamburgische Dramaturgie* (1767-68), give proof of the growing international interest already shown by Saint Evremond and Voltaire. The chief contributions of the 18th century are the flood of Shksperean criticism and the spread of the theatrical periodical. In Germany alone 133 periodicals were tried between the *Hamburgische Dramaturgie* and the end of the 18th century. Lessing leaning heavily on English example, did much to overthrow French post Cartesian standards in favour of Shksperean grandeur and liberty.

The Romantic rejection of neoclassical dogma in favour of a misty and grandiose Nature, and a grotesque medievalism, gave a new dignity to the emotions and their representation. Lessing, Diderot and A. W. and F. von Schlegel on the continent, Samuel Johnson (in one outburst against the unities), Charles Lamb, William Hazlitt and above all S. T. Coleridge in England, expressed more or less fully, the doctrines of the individual, and from their utterances emerged principles which unfortunately were not exemplified in the new drama. The chief materialization of this activity was the new conception of Hamlet as an amalgam of Byron, Prometheus and Werther. In France alone, with the theory and practice of Victor Hugo (*Préfaces to Cromwell*, 1827, and *Hernani*, 1830), was there a satisfactory Romantic drama.

The 19th century was dominated by the "well made play" of Augustin Eugène Scribe and Victorien Sardou, and Francisque Sarcey was its critical prophet. His *Essai d'une esthétique de théâtre* (1876) discusses the principles by which, for the average audience, reality is replaced by illusion. The newer schools of naturalism and realism endeavoured to restore reality to the theatre, and criticism followed in their wake. Émile Zola wrote much on the theatre and wished his characters to *live* rather than *perform*. Ferdinand Brunetiere's *La Loi du théâtre* (1894) introduced a new topic of discussion. "In drama or farce what we ask of the theatre is the spectacle of a *will* striving towards a goal and conscious of the means which it employs." In Germany F. Hebbel and Gustav Freytag contributed to non-European movements. Ibsen's practice rendered theory unnecessary. The best comments for English readers can be found in C. E. Montague's *Dramatic Values* (1911) and the prefaces and writings of Bernard Shaw. Expressionism has not yet found its critic. Its theory must be sought in Friedrich Nietzsche's *Birth of Tragedy* (1877) and in the writings of Johan August Strindberg and Frank Wedekind.

The 20th Century—The chief contribution of the 20th century is the remarkable advance in Shksperean criticism. The pioneer in the 19th century was Coleridge, but nothing really important followed until A. C. Bradley's *Shksperean Tragedy* (1904), a penetrating analysis of character and its dramatic significance. It held the field until the emergence of the new criticism based on practical knowledge of the theatre, with its insistence on the function and importance of the "producer," a concept which crystallized about 1889. The pioneer productions of William Poel in the Elizabethan manner influenced the practice of Harley Granville-Barker at the Savoy theatre (1912-14), and

from their practice emerged Granville Barker's brilliant series of *Prefaces to Shakespeare* (1927-47). Edward Gordon Craig's *The Art of the Theatre* (1905) and *Towards a New Theatre* (1913) directly affected Max Reinhardt's Deutsches theatre in Germany, C Stanislavsky's Moscow Art theatre in Russia and Jacques Copeau's Vieux Colombier in France, and influenced the English theatre through Michel St Denis' work at the Compagnie des Quinze and at the Old Vic. From Russia the psychological theories of acting and production of Stanislavsky radiated throughout the world and particularly influenced the serious theatre of the United States. Stanislavsky's pupils V Meyerhold and E Vakhtangov, as well as A Turov of the Moscow Kamerny theatre, by their writings and their productions at home and abroad materially deepened the foundations of dramatic criticism. Unfortunately the Moscow Art theatre never visited England but Vakhtangov's production of *The Dybbuk* was performed in London by the Habima theatre in 1929.

A new element in criticism emerged from the French theatre in the plays and theories of Jean Cocteau, J P Sartre and Albert Camus a new concept of dramatic myth embodied in prose recreations of Greek drama. The re-emergence of poetic drama produced searching explorations of the fundamentals of drama in the writings of T S Eliot culminating in his *Poetry and Drama* (1951), and in Francis Fergusson's comprehensive and profound *The Idea of a Theater* (1949). Allied to this movement is the critical approach to Shakespeare which lays special emphasis on the dramatic function of poetic imagery, leading to W H Clemens' *Shakespeare's Bilder* (1936, revised and translated as *The Development of Shakespeare's Imagery*, 1951). A new dimension was added to dramatic criticism by the more serious advances in the art of the cinema, and particularly in the U S S R, the critical and theoretical writings of S M Eisenstein deepened and enriched the criticism of the theatre.

DRAMBURG, town, province of Pomerania Prussia Germany, on the Drage, a tributary of the Oder, 50 mi east of Stettin on the railway Ruhnów-Neustettin. Population (1946) 3,504. After 1945 the name was changed to Drawsko when it became part of Koszalin province in Poland. Its main industry is wool milling.

DRAMMEN, a town in the county of Buskerud, Norway, at the junction of the Drammen river with the Drammen fjord, the western branch of the Oslofjord. Pop. (1950) 27,297. The town is divided into two sections, Bragernes north of the river and Stormsø and Tangen to the south. A fishing village existed there in the 13th century. In 1615 Bragernes and Stormsø were incorporated and in 1811 they were united into a municipal town under the name of Drammen. The town is an important railway junction and the export centre for one of the richest forest districts of Norway. Along the Drammen watercourse is centred much of the Norwegian wood pulp, cellulose and paper industry. The town has several engineering works and saw mills. Wood pulp, cellulose, paper, timber, frames and mouldings are ordinarily exported, while coal is the most important import.

DRAPER, JOHN WILLIAM (1811-1882), U S scientist, was born in St Helen's, near Liverpool, Eng, on May 5, 1811. He studied at Woodhouse Grove, at the University of London, and again, after removing to America in 1832, at the medical school

of the University of Pennsylvania (1835-36). In 1837 he was elected to a medical professorship in the New York university, but, as its medical school was not organized at once he began his work in its college as professor of chemistry (1839), and was a professor in its school of medicine (1840-50), president of that school (1850-73), and professor of chemistry until 1881. He died in Hastings, N Y, on Jan 4, 1882. Draper made important researches in photochemistry and was among the first to take the human portrait by light.

His son, **HENRY DRAPER** (1837-1882), graduated from the medical school of the New York university in 1858. He was professor of natural science in New York university in 1860, professor of physiology (in the medical school), and dean of the faculty in 1866-73. He succeeded his father as professor of chemistry, but only for part of a year as he died in New York on Nov 20, 1882. Henry Draper's most important contributions to science were made in spectroscopy, he ruled metal gratings in 1869-70, made spectrum photographs after 1871 and proved the presence of oxygen in the sun in 1877.

DRAPER One who deals in cloth or textiles generally. The Drapers' Company is one of the great livery companies of the City of London. The fraternity is of very early origin. Henry Fitz Alwyn (d 1212?), the first mayor of London, is said to have been a draper. The first charter was granted in 1364. The Drapers' guild was one of many subdivisions of the clothing trade, and apparently was confined to the retailing of woollen cloths the linen drapers forming in the 15th century a separate fraternity, which disappeared or was merged in the greater company.

DRAUGHT, the act or action of drawing extending, pulling, etc. (from the common Teutonic word "to draw", cf Ger *Tracht*, load, the pronunciation led to the variant form "draft", *q v*, now confined to certain specific meanings). It is thus applied to animals used for drawing vehicles or loads, "draught oxen," etc., to the quantity of fish taken by one "drag" of a net, to a quantity of liquid taken or "drawn in" to the mouth and to a current of air in a chimney, a room or other confined space. In furnaces the "draught" is "natural" when not increased artificially, or "forced" when increased by mechanical methods (see *BOILERS*). The water a ship "draws," or her "draught" is the depth to which she sinks in the water as measured from her keel. For the use of the term "draft" or "draught" in masonry and architecture see *DRAFTED MASONRY*.

DRAUGHTS or **CHECKERS** Checkers is a game of mental skill played by two persons on a board graduated into 64 light and dark squares, identical to the chessboard. At the start each participant is allotted 12 disk shaped men or pieces comprising his side. They are usually constructed of wood or plastic material finished in contrasting colours. Known as draughts in Great Britain the game is played under virtually the same rules throughout the English speaking world.

The equipment is inexpensive, the rudiments childishly simple,

yet so profound are its labyrinthian intricacies that absolute mastery is beyond the grasp of human endeavour. A multitude of devotees are well aware of this fact and it but whets their appetite for the silent pastime. It is the inherent desire to combat against opposing forces, whether they be physical or intellectual, that makes the battle of checkers fascinating. Educators see in it a ready medium for developing the faculties needed for life's rigours and organize clubs at school. Physicians recommend it as a therapeutic to nervous patients and convalescents. Clergymen like to see the game played, knowing that the urge to gamble which debases so many amusements, gets little impetus here. Civic leaders recognize this popularity and foster activity at recreation centres and play areas.

Rules and General Instructions—The board and men are arranged as illustrated in fig 1 with the Single Corner to the left. Fig 2 shows the standard system of numbering the board for recording games and positions. To begin, the Black men always

FIG 1—CHECKERBOARD OR DRAUGHTSBOARD SET FOR PLAY

occupy squares 1 to 12 and White men invariably rest on squares 21 to 32. All action occurs on the network of 32 dark squares, the reversed diagram is a concession to the printer, facilitating the use of matrices slotted to receive any combination of symbols. The men are designated Black and White, regardless of actual colour. In the United States the official is red and white men, dark green and buff board. This colour scheme is suitable for prolonged study, in sharp contrast to the red and black toy sets in common use.

The first move must be made by the party having the Black men, the second by White, and thus continuing in rotation to the end of the game. After each game the players exchange colours.

Mechanically, the play consists of advancing a man diagonally forward to an adjoining vacant square. If an opponent's piece is in the next square ahead with a vacant space beyond, it must be captured and removed by jumping over it to the empty square. Successive jumps in a straight or zigzag direction must be simultaneously completed. When there is more than one way to jump the player has his choice. When a man first enters the king row (squares 29, 30, 31, 32 for Black and 1, 2, 3, 4 for White) he must be crowned by the opponent who places another piece of the same colour over it. A man reaching the king row via a capture, has finished his move and rests there to be crowned, before reentering the fray. As the king has the added privilege of moving and jumping backward, this rule has an effect on strategy.

FIG. 2.—CHECKERBOARD NOTATION. BLACK OCCUPIES SQUARES 1 TO 12 AND WHITE 21 TO 32.

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16
17	18	19	20
21	22	23	24
25	26	27	28
29	30	31	32

Touch and move is the rule and if an eligible piece is played over the angle of the square on which it is stationed, the play must be completed in that direction. Not only is there a code of conduct for the contestants prohibiting anything which may tend to annoy or distract the attention of a player but the spectator is also bound to silence and non interference.

A win is scored when an opponent's men are all captured or barricaded so that he cannot move. When neither side can force a win and the trend of play becomes repetitious a draw is declared.

One rule that has been a source of controversy among the unlearned is about the jumping of pieces. According to the Anderson laws (drafted in 1852) if a player fails to jump or complete a jump his opponent may impose a penalty. He has the option of compelling the take, letting the oversight abide, or he can "huff" (remove) the man which should have captured. The huff does not in itself constitute a move. American tournament regulations outlaw the huff and require all jumps to be performed, but outside the United States it is still permitted by some organizations. In serious competition such lapses are infrequent and few masters have troubled to make an issue of it. Children delight in huffing less alert playmates.

History—There is good evidence of the game's ancient origin, both factual and circumstantial. That checkers was played in the days of the earlier Pharaohs is well authenticated by Egyptian history and the British museum contains specimens of primitive boards quite similar to our present ones. Intertwined with the roots of chess, a sister game, there is some conjecture over priority. Checkers being simplest in form it is reasonable to presume it was devised first, and that chess followed as an elaboration. Plato and Homer mentioned the game in their works and the Romans are believed to have imported it from the Greeks. Comparison of these games of antiquity with the modern pastime may be speculative, nevertheless the earliest publications on record manifest the 12 men on each side and our conventional board.

Antonia Torquemada, of Valencia, published the first book on checkers in 1547. Other Spanish issues followed and in 1650 Juan Garcia Canalejas published a notable volume containing games and traps still proving dependable. The Spaniards may have received their knowledge from older sources in Arabia through the Moors.

William Payne, a mathematician, is the pioneer of English draughts literature and his book, *Guide To The Game Of*

Draughts, appeared in 1756. A striking feature of Payne's book is the dedication by Dr Samuel Johnson, who was exceedingly fond of the game. In 1800 Joshua Sturges brought out a treatise that served as a textbook for nearly half a century until the advent of Andrew Anderson's elaborate compilation in 1848. Thereafter the literature multiplied at a rapid pace and by 1900 the books counted up in the hundreds. In newspaper columns and periodicals a student could find games and problems, analyses by critics, reports on tournaments, matches and correspondence play, together with notices of simultaneous and blindfold entertainments by itinerant champions.

The roster of modern champions begins with Anderson, who retired about 1850 after playing five matches (four of which he won) with the celebrated James Wyllie, another Scotsman. Wyllie the "Herd Laddie," then claimed the title and held it for some 40 years, playing matches all over the world. He lost and regained the honour in encounters with Robert Martins, a Cornishman, and was defeated in 1856 by Robert D. Yates, a young Boston medical student, who retired to finish his education. James Ferrie, of Glasgow, ended Wyllie's reign in 1894. Two years later Ferrie bowed to Richard Jordan, of Edinburgh, and the latter died unbeaten in 1909. However, Charles F. Barker, the American champion, held him even in 40 games in 1900. Robert Stewart, of Blairadam, Fifeshire, Scotland, outpointed Newell W. Banks, Detroit master, by a score of 2 to 1 and 37 draws in 1922 to fill the vacancy. Stewart had several challengers in Britain and America but never defended the title after his match with Banks. In 1934 the American Checker association sanctioned a match between Banks and Asa A. Long, of Toledo, Ohio, for the championship and Long won by a score of 7 to 3, and 27 draws. He defended it against Edwin F. Hunt, of Nashville, Tennessee, in 1937, winning 3 to 1, and 35 draws. The leading British player, Samuel Levy, planned to meet Long for the title but he died in 1939.

Since 1900 the growth of scientific play has been stepped up by the advancement of American players, who made rapid progress, spurred on by their first team match with a representative British group in 1905. The contest was on the two-move restriction style of play, at which the U.S. aggregation was no match for the more seasoned Scotch masters, the greatest of their day, and they were defeated by a score of 73 to 34 and 28 draws. A second international match in 1927, staged in New York city, found the Yankees in front by 96 wins to 20 and 364 drawn games, indicative of the strides made in the new world.

Opening Restrictions—At first all expert play was unrestricted or "go-as-you-please," the opening moves left entirely to the discretion of the individual. But during one of the Wyllie Martins matches in 1863 an episode occurred which crystallized the need for widening the game's scope. A variation of the Glasgow opening (since dubbed Martins' Rest) was repeated 21 times. This act was attributed to the fear each player had of the other and paved the way for gradually introducing the two move restriction, where the first move on each side is balloted, compelling the handling of 43 openings and tremendously increasing the sweep of the game. Three-move, or the American restriction, was adopted in the United States in 1929, raising the playable openings to 137. Launched explicitly to forestall lengthy heats of drawn games in tournaments overcautious experts whose forte was safety first lines of published play, it was expected the plurality of openings would nullify the advantages of "book" and produce pure crossboard checkers, long the ideal of many players. This assumption quickly proved erroneous for the newest restriction presented many unbalanced games, structurally feeble at the start, requiring still greater efforts of study and private research. Three move is handicap checkers and has trebled the professional's labour. Eleven-mn ballot, removing one piece by 10 from each side at the start, increases the openings into the thousands and is a generator of originality. But aside from a few proponents it has failed to gain favour.

Theory and Tactics—The initial step in becoming a scientific player, after learning the rules, is the cultivation of simple tricks and catches that bear fruit immediately or within a few

moves. These minor manoeuvres are abundant in variety and effective at all stages of the game, but more so with fewer pieces on the board. They can be considered as the "good moves" that laymen always request experts to reveal. Actually, good and bad moves are relative terms, pertinent to any given situation and not amenable to a broad application. A move that works perfectly in one instance will fail utterly in another almost identical position. In a sense mathematical exactness is the soul of the game and an error is irremediable. Still the combinations are infinite and longstanding lines of play are constantly being corrected and outmoded by a host of busy analysts probing new twists and turns. Playing faultlessly through an entire game requires an understanding of the techniques peculiar to the opening, midgame and ending.

The early acquisition of kings is a tactical factor of obvious simplicity. Skillfully handled to extract the maximum of power the first king on the board decides many contests by prompt action, preventing a similar breakthrough by the opposition or rendering it costly in material and position. When possible it is usually a wise plan to sacrifice a man in order to crown and attack from the rear, especially if one's own king row is firmly shielded.

Most sacrifices, squeeze plays, waiting moves and compound strokes are tactics of a major character, the effects of which may not be instantly apparent to the beginner. Master play involves long, accurate reaches where the small tactics serve as threats and stumbling blocks en route while the grand tactics are posed as *coups de grace*. This ability to calculate at play is called 'crossboard' and among first class players is developed to a fine degree whereby they can visualize the pieces in action through many subsequent moves. Although crossboard is an important weapon it is outweighed two to one by memorized knowledge. Thus the strongest player is at a disadvantage if manoeuvred into a 'cook' (privately analyzed departure from established play) and has to find the right moves across the board. However, crossboard is not guesswork or the hopeful anticipation of blunders but a methodical process likewise based on a repertoire of memorized data. The time limit governing official contests is five minutes and one minute grace. Seemingly an eternity to the uninitiated it is insufficient to cope with the ramifications of a new position which an opponent may have explored for several hours. It is deemed good policy to run for a draw in a strange position if a definite weakness cannot be located in the adversary's game.

If checkers can be said to have a master key it is in the application of forcing play, a principle experts endeavour to exercise at all times. Of course it is necessary to be well schooled in the fundamentals to know how to put it into practice and a fund of reliable published games, properly classified and arranged in the storehouse of the mind, is most essential. Also one must understand the influence of the "move" (a later lesson). For the self-taught student it is a difficult task to formulate a high grade forcing system out of the vast number of book games available. Best results are had through the guidance of experienced players.

In the opening and midgame phases of play, an essential technique is transposition, to divert the game into desired channels, and to exclude unwanted variations. The famous Canalejas (or Montero) stroke is used as an example. Ensnared at Black's 3rd move it is the quickest win on the board. As originally published it springs from the Bristol-Cross opening, 11-16, 23-18, 16-20, 24-19, 8-11, and White wins by 19-15, 10-19, 18-14, 9-18, 22-8, 4-11, 27-24, etc. Note the alternate ways of forming the same trap, like going to the theatre by different routes.

11-16, 24-19, 16-20, 23-18, 8-11
12-16, 23-18, 16-20, 24-19, 8-11
12-16, 24-19, 16-20, 23-18, 8-11

Among masters the use of transposition is an art and the switch in about of play is uncanny.

Strokes or "shots" are a joy to all players and usually the chief resource of the amateur as he depends on them for the gain of material. The expert finds them a valuable foil but he will not try to entice his opponent into a shot which, if parried, will leave him with an inferior position. He uses the shot tactically to re-

strict the movement of his opponent's forces, threatening pieces that may be at the extremes of the board.

The 19th century leaders found certain patterns or formations appeared regularly in their contests, sometimes from different openings. Searching analyses and crossboard experimentation tested the soundness and formidability of these positions and they have remained as the foundation for all good play. They created a huge compilation of play, much of which was substantial, but a large proportion of the games had the drawback of not being forceful, and keen students of the board by passed many variations in the early stages of games to eliminate countless lines. Soon the better players were confining their games to forcing lines and the result was a high percentage of drawn games.

Their system of controlling the openings is a good one for the beginner to adopt. Black has a choice of seven starting moves and analysis, especially that worked up during the two-move restriction period, has proven all of them when perfectly played will draw. One of the moves, 11-15, definitely gives Black the superior game. Its advantage seems to be that with it Black occupies the centre of the board and he makes the development with the piece on the single corner side, where he is least vulnerable. In the middle of the board a piece has its greatest mobility, having two directions to move in, while at the edge there is only one. A piece at the side is secure against attack but the centre man is preferred since it is better to be aggressive. With 11-15 he has a good choice of moves against any of White's replies and continues to be the aggressor if he wishes. Because of its known advantages 11-15 has been more extensively played and analyzed than any of the other openings.

The Double Corner, 9-14, is an equal game when White replies 22-18 or 24-20. 10-15, 11-16, and 12-16 tend to give White the better game but in no case is it enough to cause any problem. 9-13, however, is weak when White counters 22-18, the counter-move to 11-15. The advantages gained are the same as mentioned above plus the fact that Black has cramped himself by his opening side move. After 22-18 Black must thoroughly understand the defense if he is to maintain a sound game against an adept.

The 9-13 move is known as the Edinburgh opening, while the others are 10-14, Denny, 10-15, Kelso, 11-16, Bristol, 12-16 Dundee. The 11-15 openings are known by the White reply in several cases: 21-17, Switcher, 22-18, Single Corner, 23-18, Cross, 24-19, Second Double Corner, 24-20, Ayrshire Lassie 11-15, 22-17 and 11-15, 23-19 have a number of distinctive formations labelled with quaint names. Several of these follow:
Old Fourteenth—11-15, 23-19, 8-11, 22-17, 4-8
Glasgow—11-15, 23-19, 8-11, 22-17, 11-16, 24-20, 16-23
Laird and Lady—11-15, 23-19, 8-11, 22-17, 9-13, 17-14
File—11-15, 23-19, 9-14, 21-17, 5-9
Souter—11-15, 23-19, 9-14, 22-17, 6-9
Whitler—11-15, 21-19, 9-14, 21-17, 7-11
Dyke—11-15, 22-17, 15-19
Maid of the Mill—11-15, 22-17, 8-11, 17-13, 15-18

In the two move restriction the openings are, generally speaking, evenly balanced. 9-13, 23-18, 10-14, 22-17, and 12-16, 24-20 being considered most difficult for Black. While 9-13, 21-17 and its twin 11-15, 21-17 when followed by 9-13 is hardest for White. The three-move restriction, however, has a field of openings unfavourable to Black. Most of them were seldom ventured in the earlier modes of play.

The midgame is vast and complex. Skill here comes largely from memorizing games. Novices customarily begin by learning a variation of the Old Fourteenth, so called because it was the fourth game in the guide published by Sturges. Following is the play, the soundness of which is beyond dispute.

11-15	28-24	1-6	17-14	26-30	28-19
13-19	8-11	22-17	10-17	19-15	13-17
8-11	26-33	18-22	21-14	30-26	8-4
22-17	9-14	25-18	6-10	15-8	17-22
4-8	31-26	15-22	30-25	26-22	4-8
17-13	6-9	21-18	10-17	32-28	22-26
15-18	13-6	14-23	25-22	22-15	19-15
24-20	2-9	27-18	22-26	24-19	26-30
11-15	26-22	9-13	21-14	15-24	

Drawn—Sturges, 1800

Obviously other moves are possible. Some are beaten quickly because they lose a man or ruin the position but many will draw. The student can become familiar with all of them since the opening has been analyzed almost to exhaustion.

Two characteristic midgame formations are illustrated in the above game. Black is developing his men in the centre with the object of spreading the opposing forces to the sides where they may become a liability in the endgame. The White pieces demonstrate the side game which, though less desirable, also has advantages. Pieces at the sides are more immune to attack and require less material for making exchanges. It takes three men to make trades in the middle of the board and only two at the sides. Sometimes this is an important matter because the exchange is the principal means of removing the barriers to an advance. The theory of the side game is to flank the centre pieces and undermine them. This happens infrequently except against the novice who makes the mistake of cramping his men in the centre. The short game that follows is an exposition of the point 11-15, 23-19, 8-11, 22-17, 4-8, 17-13, 9-14 (defendable but tends to overdevelop the centre), 25-22, 5-9 (fatal), 26-23, 1-5, 22-17, and Black must lose a man.

Another common formation is the Dyke, deriving its name from the Dutch word meaning wall, and is made by fixing pieces on 19, 15, 10 and 14. The term is sometimes applied when the piece is located on 19 only early in the game, where the full development is not possible or in line with the player's strategy. Dykes are strongest when a larger number of men remain on the board after their formation. Ten man dykes particularly when the Double Corner remains intact, are formidable. Nine man dykes are even, eight man dykes are unfavourable to the dyking player. Newell Banks' *Scientific Checkers* published first in 1923 contains studies of the dyke principle whose use he advocates in a number of openings. Some of them are weak and frowned upon by authorities.

The Pioneer is a midgame pattern of great frequency. It tends to be a counterpart game, both sides building up a side game against the opponent's Double Corner, following up with centre attacks. A typical run-up is 9-14, 22-17, 11-16, 24-19, 8-11, 25-22, 11-15, 17-13, 15-24, 28-19, etc. This game, then, is a cramp and an attack on the Double Corner as part of the same strategy. Oftentimes the Pioneer and the Dyke are rival games since in several openings a player must choose between them. Since some experts are partial to one or the other of the formations they are known as Dyke players or Pioneer players. The Pioneer is said to get its preference because its principle formations may be developed from numerous openings, thereby eliminating the need to study a lot of additional play. Arthur Reisman in *Championship Checkers* (1942) gives a complete list of openings that transpose into the Pioneer with games and theory on the formation.

Two defense schemes receive attention in the books on the game. The bridge defense, which the amateur is prone to over-emphasize, consists of maintaining pieces on 1 and 3. If it can be sustained for the endplay the bridge is a strong position. The opponent trying to make a crown against this defense must have the use of a piece on 10 before any of his men can cross into the king row. In most cases the bridge can only be cracked by using three men to trade off one of the bridge pieces. The man on 10 is in jeopardy if Black can muster two kings to attack it. Should the opponent place a man on 5 or 12 the bridge increases in strength.

The triangle theory of defense consists of keeping men on 2, 3 and 7. As it stands the position does not prevent White from entering the king row via 13-9, although the newly-made king could be exchanged by 2-6. The virtue of the triangle is mobility which allows the pieces to assist in many types of strategy late in the game. Of all the pieces on the board at the start, 2 (or White's 31) is the potential occupant of more squares in its journey to the king row than any other piece. It may occupy 26 squares. Three is next in power, being capable of holding 25. Seven, which is known as the apex piece, may cover 22. This is one less than the man on 1, but it has the advantage of being

centrally located and able to co operate closely with 2 and 3. It is interesting to note that 7 can potentially occupy two more spaces than the king row piece on 4.

The Move—An elemental force in checkers is the move or opposition. Simply stated it means having the last legal move to pin down the rival pieces. As the move fluctuates with almost every exchange it is not significant until the ending looms and the trades can be controlled. The move in itself is not vital, more important is the manoeuvring to govern its shifting influence to advantage. A number of standard endings are won from settings where initially the move is adverse.

Veteran players generally calculate the move by visualization at times finding the use of a formula helpful. To determine who has the move when the sides are equal in number, the one whose turn it is to play counts all the pieces within the columns having black squares at the bottom. If the sum is odd he has the move, and if even his opponent has it. If a White piece on 5 is blocked by a Black piece on 1, or a Black man on 28 by a White one on 32, these pieces are cancelled from the calculation. With uneven sides each player has the move in one wing and some man down draws can be obtained by erecting a defense in the favourable sector.

Endgame efficiency is predicated on the knowledge of precise ending problems that constitute a beautiful branch of the game's science. The forcing play principle is a potent factor and the possibility of reducing any given position to an absolutely certain conclusion nears reality. Endgame play requires timing and exactitude, and yet it offers the chance to display creative ingenuity. In addition, it permits the use of many midgame manoeuvres while having a fund peculiar to its own stage. The move is an important factor in bringing out many scientific wins, but it is often secondary as the position may contain 1 manoeuvre that will accomplish the desired result.

It takes two kings to oust and corral one sheltered in the Double Corner. Therefore, an advantage of one piece is usually enough to win. But two kings caught together in the Single Corner can be held there by one opponent. In the position Black on 29 and 25, White on 26, Black playing cannot release himself. One piece can bottle up three in the Single Corner in a few situations.

When a player has the advantage of the man, judicious exchanges are advisable in completing the win. The question of ethics is not involved as it is pointless to drag out a game to give the opponent a chance and perhaps make an error which will alter the result. In diagram 3, where White has three kings attempting to overcome a Black king lodged in each Double Corner, White must compel an exchange to win. Though puzzling to many the solution is easy. A sequence of correct moves is necessary and one wrong play retards the win by several moves. Play from the illustrated setting, 18-15, 24-28, 23-27, 6-1, 14-10, 28-32, 27-24, 1-5 (or 32-28 24-19, 28-32, 10-6, White wins). Every move executed by a skillful player is carefully planned with a definite objective, nothing is left to luck.

As analysis of the midgame helped overcome many of the difficulties, so studies of positions that appear regularly have given players a knowledge of endings. These fundamental positions are of a high order and thought to be the most marvelous discoveries made in the game. Banks chose 12 which he called the great master pieces, but others usually think of them as comprising about a score of critical situations. In general, the terms given under them seem to contradict the appearance. Positions which seem equal can be won, while those in which there is a numerical superiority draw. Oftentimes the play to fulfill the terms is long and exacting, and usually they illustrate the weakness of pieces pinned at the sides of the board. The fundamental positions serve as a background that enables the cross-board expert to determine the outcome of a midgame when he can force one of them arising, which would be impossible without that knowledge. First Position has been known for two centuries, and it appears in Pavane's work. Most of the others have been developed since Anderson's day. Joseph M. Duff's *Standard Positions* is the best work on the subject extant. The attacking side must have the move or the position will draw. From the diagrammed setting the play continues 27-32, 28-24, 23-18 (avoiding the 24-19 swap which would

Louis T deBeaur v Nathaniel H Rubin

An idea of what the three-move player is up against can be had by examining a game played in the Ninth American tournament (1937). The Octopus is one of the most dreaded openings, and the qualified opinion marks it as untenable, or at best a hairline draw.

11-16	22-13	6-15	20-25	11-16	30-26
22-17	11-15 B	13-6	18-23	23-18	27-24
7-11 A	23-19	1-10	25-21	8-11	32-27
17-14	16-23	25-22	3-7	21-17	16-20
10-17	26-10	8-11	27-23	5-9	26-23

White wins—Walter Hallman v Asa A Long

A. Black's forces are left badly arrayed by this move.

B. This position also comes up from the 10-15, 21-17, 7-10 opening by continuing 17-14, 10-17, 21-13, 11-16.

Spanish Checkers.—In the Spanish game the board is turned so that the Single Corner is to the players' right. A king can move over any number of empty squares on the same diagonal. It is compulsory to jump the largest number of pieces. Otherwise, the rules are the same as in the British game.

Italian Checkers.—The Italian game varies from the Spanish (its probable ancestor) in the scope of the king, which has the same move as in the British game. The board is placed as in Spanish checkers. It is similar to our game, except that the king is immune to capture by a man.

Polish Checkers.—This is the most popular form on the continent, and acquired its name from an early Polish exponent in Paris. The board has 100 squares, 50 being used in play. It is placed with the light coloured end squares to the players' right. Each player has 20 men which move forward but capture forward or backward. A crowned man, called dame or queen, has the same move as the Spanish king. The maximum capture is compulsory. When a man jumps into the king row he continues capturing without being crowned if further pieces remain to be taken. The huff has been abolished.

Turkish Checkers.—All 64 squares are used in this game, the men move to the sides or straight forward, but not backward. There are 16 men to a side, 8 each on the second and third rows to commence. Captures are made either to the side or forward, the maximum take is enforced. Pieces are removed one by one when captured. The king has a sweep of any number of squares.

Losing Checkers.—As the name implies the object of this game (applicable to any game of checkers) is the reverse of the regular play. The first one succeeding in giving away his men or immobilizing them wins.

DRAUPADI, in Hindu legend daughter of Drupada, king

of Panchāla, and wife of the five Pāndava heroes in the *Mahābhārata*.

DRAVE or **DRAVA** (Ger *Drau*), one of the principal right-bank affluents of the Danube. It rises below the Innichner Eck in Tirol, at an altitude of over 4,000 ft., runs eastward, and forms the longest longitudinal valley of the Alps, the Drau Thal. The Drave is 450 m long, near Zakkany it is joined by the Mur. The valley of the Drave was the chief road through which the invading peoples of the East, such as the Huns, the Slavs and the Turks, penetrated the Alpine countries. The Drave flows through Carinthia and Styria, and forms the boundary between Hungary and Yugoslavia from Varaždin near Osijek. At its mouth the Drave attains a breadth of 1,055 ft and a depth of 20 ft. The Drave is navigable for rafts only from Villach, and for river steamers from Bärce, a distance of 95 m. The principal towns on the Drave and its affluents are Klagenfurt, Graz, Maribor and Osijek. (See *DANUBE*.)

DRAVIDIAN, a name only applied in Indian usage to the "Southern" group of the Brahmins *q v*. But "Dravidian" is applied, unfortunately, to the indigenous peoples of India south of the Vindhya and the northern half of Ceylon, it should be confined to the languages of this area. At least four different stocks have contributed elements in their population. The earliest is dark, short, with wavy hair, broad noses and long heads, so that some have detected affinities with Negroids. This stock, represented by Kādrys and Kurumbas, is akin to the Veddas and to Australian peoples and to the Semang and Sakai (see *ASIA, Anthropology and Ethnology*). Other elements are physically distinct and we have in the Nambutur Brahmins the purest Aryan stock. The range of culture is equally wide. The Dravidians occupy the oldest geological formation in India, the medley of forest-clad ranges, terraced plateaux, and undulating plains, from the Vindhya to Cape Comorin, and among them we find the construction of dolmens, the use of the boomerang, kinship in the female line, totemism and many primitive usages. But in the same are found a high degree of civilization, with a remarkable literature and evidence of artistic skill.

E Thurston, *Castes and Tribes of Southern India*, vol. 1 (exhaustive introduction), 1909, *Cambridge History of India* vol. I (1913), R. D. Dixon, *Racial History of Mankind* (1912).

DRAVIDIAN LANGUAGES, the name given to a collection of Indian languages comprising all the principal forms of speech of Southern India (Sanskrit *Dravida*). Their territory, which includes the northern half of Ceylon, extends northwards up to an irregular line drawn from a point on the Arabian sea about room below Goa along the Western Ghats as far as Kolhapur, thence north east through Hyderabad, and farther eastwards to the Bay of Bengal. Farther to the north, Dravidian dialects are spoken by small tribes in the Central Provinces and Chota Nagpur, and up to the banks of the Ganges in the Rajmahal hills. A Dravidian dialect is, finally, spoken by the Brāhūis of Baluchistan in the far north-west.

Classification.—Tamil and Malayālam can be considered as two dialects of one and the same language, which is, in its turn, closely related to Kanarese, Tulu, Kodagu, Toda, and Kōta. Between Tamil Malayālam and Kanarese, though more nearly related to the latter than to the former. The same is the case with Kurukh and Malto, while Kui and Gondi gradually approach Telugu, which latter language seems to have branched off from the common stock at an early date. Finally, the Brāhūi dialect of Baluchistan has been so much influenced by other languages that it is no longer a pure Dravidian form of speech.

The Dravidian languages are gradually losing ground in the north, where they meet with Aryan forms of speech. This process has been going on from time immemorial, but it is still possible to trace a Dravidian element in the Aryan languages of North India.

The Dravidian languages form an isolated group, and it has not been possible to prove a connection with any other family of languages. Such attempts have been made with reference to the Munda family, the Tibeto Burman languages, the Ural-Altaic languages, and the dialects spoken by the aborigines of the Australian

continent. The arguments adduced have not, however, proved to be sufficient. The Dravidian family has several characteristic features of its own. The phonetic systems of the smaller dialects deserve close study and analysis. In general the pronunciation is soft and mellifluous.

Main Features.—In Dravidian words a line above a vowel shows that it is long. The dotted consonants *ṭ*, *ḍ*, and *ṇ* are pronounced by striking the tip of the tongue against the centre of the hard palate. The dotted *l* is distinguished from *l* in a similar way. Its sound, however, differs in the different districts. A Greek *χ* marks the sound of *ch* in "loch", *ξ* is the English *sh*, *c* the *ch* in "church", and *ri* is an *r* which is used as a vowel. Abruptness and hard combinations of sounds are avoided. There is a distinct tendency to avoid pronouncing a short consonant at the end of a word, a very short vowel being often added after it. Thus the pronoun of the third person singular, which is *avan*, "he," in Tamil, is pronounced *avanu* in Kanarese, the Sanskrit word *vak*, "speech," is borrowed in the form *vāku* in Tamil, the word *guram*, "horse," is commonly pronounced *guramu* in Telugu, and so on. Combinations of consonants are further avoided in many cases. This tendency is illustrated by the changes undergone by some borrowed words. Thus the Sanskrit word *brahmana*, "a Brahman," becomes *barāmana* in Kanarese and *paramana* in Tamil, the Sanskrit *Dramida*, "Dravidian," is borrowed by Tamil under the form *Tramida*. *Dramida* which also occurs as *Dravida* is in its turn developed from an older *Damila* which is identical with the word *Tamir*, Tamil.

The forms *paramana* and *Tramida* in Tamil illustrate another feature of Dravidian enunciation. There is a tendency in all of them, and in Tamil and Malayalam it has become a law, against any word being permitted to begin with a stopped voice consonant (*g, j, d, b*), the corresponding voiceless sounds (*k, c, t, p*, respectively) being substituted. In the middle of a word or compound on the other hand, every consonant must be voiced. Thus the Sanskrit word *danta*, "tooth," has been borrowed by Tamil in the form *tandam*, and the Telugu *anna*, "elder brother," *tammulu*, "younger brother," become when compounded *annadammiu*, "elder and younger brothers."

There is no strongly marked accent on any one syllable, though there is a slight stress upon the first one. In some dialects this equilibrium between the different parts of a word is accompanied by a tendency to approach to each other the sound of vowels in consecutive syllables. This tendency, which has been called the "law of harmonic sequence," is most apparent in Telugu, where the short *u* of certain suffixes is replaced by *i* when the preceding syllable contains one of the vowels *i* (short and long) and *ei*. Compare the dative suffix *ku*, *hi*, in *guramu-ku*, "to a horse", but *tammuni hi* "to a younger brother." This tendency does not, however, play a prominent role in the Dravidian languages.

Words are formed from roots and bases by means of suffixed formative additions. The root itself generally remains unchanged throughout. Thus from the Tamil base *per*, "great," we can form adjectives such as *per iya* and *per um*, "great," verbs such as *per u gu*, "to become increased", *per-u-ku* "to cause to increase," and so on.

Many bases can be used at will as nouns, as adjectives, and as verbs. Thus the Tamil *kaḍu* can mean "sharpness," "sharp," and "to be sharp." Other bases are, of course, more restricted in their respective spheres.

The inflexion of words is effected by agglutination, *i.e.*, various additions are suffixed to the base in order to form what we would call cases and tenses. Such additions probably once were separate words. Most of them are, however, now only used as suffixes. Thus from the Tamil base *kōn*, "king," we can form an accusative *kōn-e*, a verb *kōn-en*, "I am king," and so on.

Dravidian nouns are divided into two classes, which Tamil grammarians called high-caste and casteless respectively. The former includes those nouns which denote beings endowed with reason, the latter all others. Gender is only distinguished in the former class, while all casteless nouns are neuter. The gender of animals (which are irrational) must accordingly be distinguished by using different words for the male and the female,

or else by adding words meaning male, female, respectively, to the name of the animal—processes which do not, strictly speaking, fall under the head of grammar.

There are two numbers, the singular and the plural. The latter is formed by adding suffixes. It, however, often remains unmarked in the case of casteless nouns.

Cases are formed by adding postpositions and suffixes, usually to a modified form of the noun which is commonly called the oblique base. Thus we have the Tamil *maram*, "tree," *marat-ai*, "from a tree," *marait-u-ku*, "to a tree," *vādu*, "a house," *vut-ai*, "from a house." The case terminations are the same in the singular and in the plural. The genitive, which precedes the governing noun, is often identical with the oblique base, or else it is formed by adding suffixes.

The numeral system is decimal and higher numbers are counted in tens, thus Tamil *patthu*, "ten," *iru badu*, "two-tens," "twenty."

The personal pronoun of the first person in most dialects has a double form in the plural, one including and the other excluding the person addressed. Thus, Tamil *nām*, "we," *ē ē*, *i* and you, *nangal*, "we," *ē ē*, *i* and they.

There is no relative pronoun. Relative clauses are effected by using relative particles. Thus in Telugu the sentence "the book which you gave to me" must be translated *mira nāku ucena pustakamu*, *ē ē*, "you me-to given book." There are several such particles in use. Thus from the Telugu verb *kotta* "to strike" are formed *kott ut-una*, "that strikes," *kott-i-na*, "that struck," *kotte*, "that would strike," "that usually strikes." By adding pronouns, or the terminations of pronouns, to such forms, nouns are derived which denote the person who performs the action. Thus from Telugu *kotte* and *vādu*, "he," is formed *kotte vādu*, "one who usually strikes." Such forms are used as ordinary verbs, and the usual verbal forms of Dravidian languages can broadly be described as such nouns of agency. Thus, the Telugu *kottimadu*, "he struck," can be translated literally "a striker in the past."

Verbal tenses distinguish the person and number of the subject by adding abbreviated forms of the personal pronouns. Thus in Kanarese we have *mādd-enu*, "I did," *mādd-i*, "thou didst," *mādd-ēvu*, "we did," *mādd-aru*, "they did."

One of the most characteristic features of the Dravidian verb is the separate negative conjugation. It usually has only one tense and is formed by adding the personal terminations to a negative base. Thus, Kanarese *mad-enu*, "I did not," *māḍ-ēvu*, "we did not," *māḍ-aru*, "they did not."

The vocabulary has adopted numerous Aryan loan-words. This was a necessary consequence of the early connection with the superior Aryan civilization.

The oldest Dravidian literature is largely indebted to the Aryans, though it goes back to a very early date. Tamil, Malayalam, Kanarese, and Telugu are the principal literary languages. The language of literature in all of them differs considerably from the colloquial. The oldest known specimen of a Dravidian language occurs in a Greek play which is preserved in a papyrus of the 2nd century A.D. The exact period to which the indigenous literature can be traced back, on the other hand, has not been fixed with certainty.

DRAWBACK, the repayment of a duty, previously exacted, when exposable goods are exported or foreign goods re-exported. The object of a drawback is to enable commodities which are subject to taxation to be exported and sold in a foreign country on the same terms as goods from countries where they are untaxed. It differs from a bounty in that the latter enables commodities to be sold abroad at less than their cost price, under certain conditions, however, the giving of a drawback has an

effect equivalent to that of a bounty. The tariffs of many countries contained tables of the drawbacks allowed on the exportation or re-exportation of commodities, but so far as the United Kingdom is concerned the system of "bonded warehouses" practically abolished drawbacks, as commodities can be warehoused (placed "in bond") until required for subsequent exportation. (See BONDING WAREHOUSE.)

DRAWING.—The art of delineation or of portrayal by means of lines, is so primitive that its history is practically that of man. That it was practised 50,000 years ago we know but for how long before that, it is difficult to establish. Its beginnings, however, must have been early, for one of the first things a child will busy its hands with is the making of marks in the dirt, and the walls of many a schoolhouse or home stand as mute witnesses to the inherent tendency of man to draw. It is a deep-rooted instinct whose satisfaction gives great pleasure.

Early Art.—In the beginning the primitive mind with its groping for essentials was satisfied with simple structural lines and, at times, outlines of those objects wherein the structure was less evident. The cave-man drew his pictures of men just as the child does—with the inverted Y for the body and legs, a cross-piece for the arms and a circle for the head, part of his drawing showing structure and part outline. The first of these drawings of the child are always without consideration of motion but it does not take long before with the addition of feet, the figure is walking and soon the arms are brought to the front. Thus we see the early beginnings of the three elements which are essential to all drawing, if it is to please man who has for thousands of generations and from childhood up been trained to expect them: structure, outline and motion. (See fig. 1.)

In order to draw the human figure successfully the artist must first learn about its bony structure. He must master the knowledge of the lengths of the various units and of their possibilities for movement (See DRAWING, ANATOMICAL). But his work does not cease in this study of structure. Trees spread their branches in certain characteristic ways each of which is slightly different, and in fact each type of leaf has its own anatomy as has every animal, bird and flower. Rocks must be closely examined and their origin understood or they cannot be given the proper structure. The artist cannot slight this work or his drawing will be unconvincing. He must spend much time in finding out how things were put together or how they grew and why.

In speaking of outline we should think first of line itself. It has been contended that "It cannot be reasonably held that one purely abstract line or curve is more beautiful than another, for the simple reason that people have no common ground upon which to establish the nature of abstract beauty." This is, of course, false, for if there were no common ground in beauty there would be very little incentive to draw other than as a simple record. But to put into words just what this beauty consists of, is a difficult task. Fig. 2 illustrates two lines. It will be agreed that one is more beautiful than the other. One has a sureness and sensitive taper while the other wanders in a hesitant and aimless manner without object, without character. Perhaps that is it. Perhaps a line can have character and therefore can show those beauties and weaknesses which we see in the characters of our fellows. This is undoubtedly possible, for no two men can draw a line exactly alike and certainly into the lines of each must creep something of the man himself (See TECHNIQUE IN ART). Therefore, beauty of line does exist but is difficult to analyze, as it is dependent upon the person

ality of the artist. It may be as difficult to tell why you like one line better than another as why you like one friend better than another, nevertheless, there is no doubt of your preference in the matter.

Besides this beauty of abstract line we find the age-old necessity for outlining objects, and when asked to describe a thing our minds at once turn to its shape. Its consistency, its structure, its movement are all often secondary unless they assert

FIG. 3—DIAGRAM SHOWING (A) DEFICIENCY OF OUTLINE ALONE (B) NECESSITY FOR STRUCTURE IN ORDER TO MAKE FORM UNDERSTANDABLE

themselves strongly. The artist has only his eyes to help him in this work but a knowledge of what lies within is also an aid to him. The author on drawing in the eleventh edition makes use of an illustration given herewith, to show how hard it often is to guess the shape of an object by its silhouette alone. (See fig. 3.) As soon as the three lines are added which indicate its structure it is obvious in shape.

It is sometimes possible to erect an imaginary structure which is of assistance and artists frequently resort to this method. For instance, in the drawing of a vase (see fig. 5) the straight lines might be sketched in lightly and would be of some assistance in judging both curves and proportions. In other words a sort of scaffolding is first erected and then the outline drawn upon it. After a little practice the scaffolding need not be drawn for the artist can visualize it without the aid of actual lines. Another help

FIG. 4—TWO REPRESENTATIONS OF THE SAME STATUE ILLUSTRATING THE VALUE OF A SILHOUETTE FIGURE (LEFT) OVER A STRAIGHT LINE RUNNING (RIGHT) IN OBSERVING FORM

in drawing the silhouette of an object is to reverse the idea and look at the silhouette of the background instead. This process is often employed by sculptors in their work and is undoubtedly of some assistance to them. But all of these are simply suggested aids to seeing, and it takes practice to be able to draw what one sees. (See fig. 4.)

THE REQUIREMENTS OF A DRAWING

Even more practice and observation are necessary to catch the movement which is also one of the fundamental appeals of good draughtsmanship. First it must be understood that there

is movement in everything. Trees, when well drawn, seem to show how through years they have twisted and grown up out of the ground. Rocks show the bending of their hot masses by volcanic eruptions and the splinting and eroding of their surfaces. Just as each thing has characteristic structure and outline so too has it characteristic movement, and this movement must be caught in the drawing and should be emulated to a degree in the very movement of the lines. One does not draw the placid sea of a summer night with the same quality of line and movement as one would use to portray its raging strength in a storm. Without typical movement a drawing lacks life and therefore interest. The savage all over the world typifies a snake by a simple wavy line showing its motion, and he feels that an animal is "not him self" in a drawing, if not shown in typical movement.

Composition—Closely related to these three fundamental requirements in good drawing is a fourth which came into the consciousness of man undoubtedly at a later date, but thousands of years ago, that is, composition. No doubt the first artists drew without any consideration of a boundary or limitation to their work, but at some time in the dim past, in the decoration of a clay vase or some other object, a discovery was made that the design was related to the space in which it was executed. Slowly through thousands of years drawings were developed which seemed to be a part of the structure of the limitations or borders themselves, outlines were so related that the eye of the observer was held within the limited area and led from one important detail to another, and it was found that movement was somewhat assisted by the proper placing of figures in the surrounding border.

Much has been written about composition. The Far Eastern artist is perhaps its greatest master. After observing carefully the object to be drawn, he sits and looks at the piece of silk or paper upon which he is to work and plans where he is to place the main features. He does not start at once to sketch as do many of our western artists, for he has found that once the pencil or brush is touched to paper one's ideas crystallize and it is difficult to get away from the slightest commitment. It is, therefore, much better to keep the mind at first in a fluid state so that the final arrangement can be unhampered and things can take their proper relationship.

Simple proportions in composition are easy to grasp and have more meaning than have those proportions which the eye does not understand. Rhythmical or parallel movements are interesting methods of accenting what seem to be the most typical lines and are often used. Perfect symmetry is tiring. It is as though one were to sit upright in a chair for a long time. The balance should then be thrown to a greater or lesser degree away from the centre to indicate the movement of the picture and give it ease. The story is told of a famous artist in Japan who was asked to paint a screen for the emperor, showing crows in flight. He at length painted one crow just disappearing off of the fourth panel, leaving the other three untouched. This composition helped the movement of the drawing, and the finished work is famous.

If these four simple laws of drawing are observed, it is possible that the finished work will be excellent, but, if any one be omitted, this is impossible. Man has for so long learned to observe structure, outline, movement and composition that the most casual observer feels a lack, if the work does not show them all. Good modelling, perspective and all other considerations can be neglected, and yet a drawing may be a masterpiece aesthetically, though there is no doubt that these do add to its appeal. But these four elements do not in themselves make a great work of art but rather their proper balancing and expression, which may be called taste.

Good Taste—In considering taste it is first necessary to understand what enters into a good drawing, or any outstanding work of art. The personality of the artist or his style is a great part of it and this may be dashing and strong or delicate and sensitive, it may be keen and light, or ponderous and powerful. There are as many styles as there are artists and much of the love that people have for some works of famous artists is due

to the fact that these works give some idea of the man himself. There is also the medium used, be it drypoint, graphite, etching, lithographic crayon or brush, and each medium has advantages and disadvantages. The drypoint line is strong and delicate without much flexibility but with a burr which is distinctive. The etched line has a sure clean cut quality, but neither admit the soft shading possible with the pencil and the crayon or the flexibility of the brush. The appropriateness of the medium and its adaptation to the subject expressed are considerations often neglected, for artists sometimes become used to one medium alone and never find out the possibilities of the others. Finally there are the mood and character of the subject to be expressed. The woodlands which Corot chose to paint seemed to be a part of an enchanted world. The jagged rocks crashing into heaven which Li Lung Mien so deftly rendered with his brush are like flames cracking against the sky. These artists added much of their own imagination to what already existed, but it is nevertheless necessary to have something to start with, and without having seen the elms of France Corot would have found it difficult to paint, as would Li Lung Mien without the rough mountains of China.

Good taste is the perfect fusion of the personality of the artist through long years of practice into a skilful wielding of the tool, which in turn expresses the vital and inner meaning of the object portrayed with all due attention to its structure, its typical silhouette and motion, with appropriate and reasonable composition. When a thing is drawn in good taste one can see what the artist felt while drawing and what his reactions were to the subject shown. Each mark on the paper not only tells how he felt and what his mood was, but what he saw in the mood of the subject. If his subject be a gladiator he may have felt the glory of battle, the vigorous strength, the cruel beauty of the contest, or on the other hand he may have felt the pity and pathos of the inevitable destruction of so beautiful a body. In the one case his strokes would be sharp and vigorous, in the other heavy and dull. Moreover the composition, structure and movement would also reflect both the artist's feelings and those of the subject, both the artist's soul and that of the subject for it is only in this dual expression finely balanced that we ever find the really great works of art.

Some artists fail in good taste because they are so self-centred that they portray everything with too much of themselves and too little of the subject in the work. Others fail because they are so weak that they attempt a totally different treatment for each subject and have nothing to say about any. A drawing may also be in good taste in its expression of line, in its balance of the subjective and objective, but fail because the composition has not been studied to express this condition and is therefore not appropriate. Drawing is like music: it has tempo, key, pitch and many other elements, all of which, when perfectly handled by a master, make for beauty, but which, in the hands of one untrained or unfeeling, may prove terrible pitfalls.

Three Dimensions—In this discussion nothing has been said of the attempt to portray three dimensions on a two dimensional surface (see PERSPECTIVE). It is the consensus of opinion that a work of fine drawing can be just as great in two as in three dimensions. Nay, it has often been pointed out that drawing is fundamentally two dimensional art and that the introduction of the third dimension savours of trickeries, and other builds lumps on the two dimensional surface or pushes holes into it. However, since the discovery of perspective, such superb trickery is it that a great vogue for its use has sprung up, and in the development of realistic painting which found its apex in the early 19th century much was done to make man expect the third dimension in drawing. Others, led perhaps by Cezanne, have attempted to give an even greater feeling of solidity to objects by the use of exaggeration and distortion. This is all interesting and may, in thousands of years to come, grow so into the consciousness of man that children drawing in the sand with a stick will spontaneously depict the third dimension, but at present it is a comparatively new development and has not yet penetrated deeply enough to make it one of the fundamental requisites. A

work of art can be a masterpiece if drawn in only two dimensions and does not gain an appreciable aesthetic advantage, if drawn in three.

The Teaching of Drawing.—Owing to a faulty understanding of terms and a general misunderstanding of the underlying principles of art there has been a great effort in the last generation to teach "originality" and individual expression in all the arts. One might as well try to teach character or soul. These are things which grow through the years and which cannot be taught. The result is a chaotic condition hampered by the belief that artists are born, and that they express their "gift" suddenly and without the work which a careful study of the lives of all great masters proves to be necessary. Some schools do not feel it is necessary to teach the pupils the fundamentals of art, so cautious are they in the foolish effort to protect their pupils' freedom. Therefore it seems necessary to consider the sane and proper method which should be followed in the instruction of others or of self.

First of all, become friendly with a ruler. A large part of the artist's work consists in measuring with the eye, and it is imperative that the eye be trained to accuracy. Only by judging distances and proportions and then checking one's judgment by measurement can this accuracy be obtained. A good plan for the beginner is to purchase a drawing board, T square, triangles, compasses and pair of medium size compasses. With these instruments an attempt should be made to draw vases of simple form so that the eye may be trained to see curves and proportions. For example (see fig. 5) after the piece of paper is fixed to the board with thumb-tacks (drawing pins) so that its lower edge is in line with the T square when pressed in place at the left side of the board, a line is drawn near the bottom to act as base line and upon this line a portion is measured off with a ruler, equal to the diameter of the base. This line is then divided in half and a perpendicular is erected at its centre, upon which the height of the vase is laid off, at this point another horizontal line is drawn, upon which is laid off the diameter of the hip centred immediately above the base. The ruler is then stood perpendicular to the table upon which the vase stands and moved until it touches the side of the vase at a point where it is widest, and another horizontal line is drawn with the T square, the same distance from the base line as this point is from the table. With the compasses this widest diameter is found and it is laid off on this line. Similar measurements are taken of the narrowest diameters and of their height from the table, and finally the curves are drawn in, touching those points which have been established.

It will be surprising to the beginner to find how accurate his first drawing is, if done in this manner. It will also be surprising to find how quickly he can grasp the amount of concavity or convexity of a curve no matter in what position it may occur, and to grasp its changes into another curve after he has drawn a number of vases. He will begin to see where one curve becomes more abrupt and another more gentle in its course. Looking back upon his first drawing, he will see all the slight delicacies of line which he missed, and will begin to appreciate the fine innuendoes the potter had put into the vase, which had at first completely escaped his eye.

The modernist may criticize this method and say that it will make the student a slave to the ruler. This is not true, for as time goes on the student needs fewer and fewer actual measurements, until at length he can draw a vase on any scale accurately. It is then time to attempt more complicated forms and these too should be measured at first. The greatest sculptors do not entirely trust their eyes for this work, and it is only by long

training and much hard though interesting work that real efficiency can be accomplished, but new beauties will reward the student at every turn as he begins to train his eye to see. There is time enough later to try certain distortions or caricatures of the objects, to gain points which it is wished to stress. These distortions must be based upon correct drawing, or they will not be convincing. During this training the student should constantly observe masterpieces of various kinds, and remember that masterpieces are not only paintings which hang in museums but vases, sculpture, furniture and all of the thousand and one other things which show the touch of real art. The East should be studied as well as the West and every thing which especially appeals should be copied, for it will be found that one sees into a thing much more if it is actually copied, than one can by any amount of mere looking at it. Through all of this study, the principles which were first pointed out should be kept in mind and an attempt should be made at all times to incorporate them in the actual work as it goes along. (W E Cx)

DRAWING, ANATOMICAL. The study of the anatomy of the human body is approached by the artist and the anatomist from different points of view. The former, by a process of artistic selection, seeks the ideal and adopts the proportions which give the most pleasing effect, while the latter desires to know only the mean, or average, of a large series of measurements. (See COMPARATIVE ANATOMY.)

ARTISTIC ANATOMY

The representation of the anatomical form of man as applied to the Graphic Arts may be called *Artistic Anatomy*. This form of illustration may be divided into three groups: (1) The schematic, (2) That which represents the subject exactly, (3) The ideal conception or the ideal figure, constructed from the mean proportion of several types.

The schematic drawing is one which represents in outline the main characteristics of the object. It may be drawn with little or no regard as to the exact knowledge of the form. It has been of use in setting forth certain physiologic principles by the general form and location of the organs of the body, and especially used in post mortem and zoologic comparisons.

The true drawings occur particularly in pathologic anatomy, where various and unknown forms are sought and where certain organs have to be shown in the individual, as in the case of human embryology and comparative anatomy.

The representation of the ideal is the only form suitable for teaching—and the very development of this figurative corresponds with the growth of the science of anatomy in all its periods. This type of drawing presupposes a vast amount of previous study of the human figure. It cannot come out of a period in which the artistic development overshadows that of the science of anatomy. This vague feeling for beauty, with a corresponding neglect of the real, was evidenced in an early period of anatomical illustration, when conditions favoured an artistic point of view, as was the case in the first half of the 16th century. This, however, changed as the cold scientific and extensive dissection was practised during the 17th and 18th centuries. It is only the combination of these two tendencies which can satisfactorily serve the advanced science of anatomy and the modern art of drawing, bringing to perfection through exactness of detail and ceaseless observation a comprehension of beauty in the entire figure.

In artistic anatomy, nothing else is of value to the artist but the idealized drawing. The more he eliminates unessential, the better, the keener his eye for the unnecessary, the bigger his vision of the true needs of the artist. The unnecessary is harmful, and the artist's presentation of too much anatomy makes of him a professional anatomist. Of immediate necessity is the study of the antique, or the older plaster models of Greek figures, for in drawing the nude the young artist visualizes the actual healthy form in all its fullness of life and movement, thus adding an element which can never be supplied by purely anatomic delineation.

HISTORY

The development of artistic anatomy was not of outstanding consequence before the 16th century. Only a few anatomical en-

FIG. 3.—DRAWING OF VASE SHOWING METHOD OF TAKING MEASUREMENTS

gravings and woodcuts are found to that date. Even the drawings that Aristotle used in supplementing his works on anatomy have been lost. Figurations of skeletons and representations of bodies on cameos, seals and bronzes were common, but these delineations never served the purpose of anatomic instruction, they were rather of an emblematic nature—symbols of death, magic amulets, references to the fable of Prometheus, etc. In view of this, artistic anatomy may be divided into the following periods.

To the 16th Century.—Anatomical drawings of the Classic Period and the Middle Ages were known, and even mentioned by Aristotle, but so few have come to us for study that the subject cannot be adequately covered. Before the time of Berengario, commonly called Berenger of Carpi, about 1521, most of the attempts were schematic drawings for medical observation, artistic anatomy remaining in the background as a private study and depending largely upon professional anatomists for its development.

The 16th Century.—Although the name Berengario belongs only to the annals of medicine and will be remembered as the most zealous and eminent in cultivating the anatomy of the human body, it was his day, and that of Vesalius (1514-64), that marked the beginning of the attempt to free the anatomical drawing from schematic and arbitrary features and recognized its place in art. This artistic anatomy, was promoted by both artist and anatomist for the sole purpose of instruction. It was during this period that the Italian School of Anatomy reached its height of interest in the woodcut, it was during this period that sculpture and painting adopted proportions of the human body never before developed, it was during this period that Michelangelo lived. Other 16th century artists who contributed to the study of anatomical figures were Leonardo da Vinci, Raphael, Titian and Durer.

The 17th Century.—A comparative study of the antique, a clinging to Vesalian patterns, and the advent of independent publications on artistic anatomy mark the development of the study in the 17th century. A closer training in details and an effort toward the artistically perfect reproduction may also be included.

18th-19th Century.—Albinus (1697-1770) was one of the most famous teachers of anatomy in Europe, his classroom at the Leyden School of Anatomy being frequented not only by students but by many practising physicians. The Leyden school exerted untold influence in creating a greater exactness in all details. The styles of both Vesalius and Albinus were used as patterns in anatomical drawing, many independent attempts proving unsuccessful.

About 1778 combinations of utmost anatomic truths with artistically beautiful reproductions were brought out. The adoption of the steel engraving, lithography, the daguerreotype, as well as the revival of the woodcut in an improved form, meant an advance in the art, the exclusive use of the Albinian patterns gave rise to a greater independence. In fact, 1778 may be given as the beginning of the period in which the most valuable material on artistic anatomy was produced. Modern scientific medicine had gained its stride and was already moving swiftly toward the goal of a well-organized body of real knowledge capable of continuous growth. And this development may be shown in the bibliographic list as given below, the chain running from the first half of the 18th century to the present day. This bibliographic account gives the distinctive examples of anatomic illustration, including the modern work in both the technical and the artistic.

TECHNIQUE

For the young student of anatomy as applied to art the simple drawing is the most effective in learning to construct the human figure. The eye must follow a line or a plane or a mass, which in construction becomes a moving line, a moving plane, a moving mass. But the mental construction must precede the physical, and in this the concept of mass must come first, that of the plane second, that of line last.

Certain laws enter into the functioning of the various organs of the body, just as pronounced as they are in controlling any other machinery. To the bones, for example, which make up the

pressure system, belong the laws of architecture, as in the dome of the head, the arches of the foot, the pillars of the legs, etc., also the laws of mechanics, such as the hinges of the elbows, the levers of the limbs, etc. Ligaments constitute the retaining or tension system, and express other laws of mechanics. Muscles produce action by their contraction or shortening and are expressed in the laws of dynamics and power, as well as the laws of leverage.

In giving herewith only an outline of the construction of the main parts of the body, the author presupposes a rudimentary knowledge of drawing, on the part of the student, and offers the following, in connection with the illustrations only as a further guide in studying the elements of anatomy and becoming more adept in the art of drawing.

The Hand.—In drawing the hand the artist must realize that, as in the human figure, there is an action and inaction side. When the thumb side is the action side the little finger is the inaction side. The inaction construction line runs straight down the arm to the base of the little finger. The action construction line runs down the arm to the base of the thumb at the wrist, from there out to the middle of the joint, at the widest part of the hand, thence to the knuckle of the first finger, then to that of the second finger, and then joins the inaction line at the little finger. However, with the hand still prone, when it is drawn from the body the thumb side becomes the inaction side and is straight with the arm, while the little finger, corresponding previously to the thumb, is at almost right angles with it. The inaction construction line now runs straight to the middle joint of the thumb, while the action line runs to the wrist on the little finger side, thence to the first joint.

The Fingers.—Each of the four fingers has three bones. The middle finger is the longest and largest, because in the clasped hand it is opposite the thumb and with it bears the chief burden. The little finger is the smallest and shortest and most freely movable for the opposite reason. The middle joint of each finger is the largest, and, like all the bones of the body, the bones of the finger are narrower in the shaft than at the ends. In the clenched fist it is the end of the bone of the hand that is exposed to make the knuckle. Each of the three joints moves about one right angle except the last, which moves slightly less. The movements of the joints are also limited to one plane, except the lower one, which has also a slight lateral movement, as shown when the fingers are spread.

The Thumb.—The centre of all the activities of the fingers, the hand, and the forearm, is the thumb. The fingers, gathered together, form a corona around its tip. Spread out, they radiate from a common centre at its base, and a line connecting their tips forms a curve whose centre is the same point. This is true of the rows of joints also. The thumb has three joints, and its bones are heavier and its joints more rugged than those of the fingers. It is pyramidal at the base, narrow in the middle, pear-shaped at the end. The ball faces to the front more than sideways. The thumb reaches to the middle joint of the first finger. The last segment bends sharply back, its joint having about one right angle of movement, and only in one plane. The middle segment is square with rounded edges, smaller than the other two, with a small pad. Its joint is also limited to one plane. The basal segment is rounded and bulged on all sides. The joint of its base is a saddle joint, with the free and easy movement of one in a saddle.

The Arm.—The forearm has two bones, lying side by side. One, the radius, is large at the wrist and the other, the ulna, is large at the elbow. Diagonally opposite the thumb, on the ulna, is a bump of bone which is the pivot for both the radius and also the thumb. Muscles must be above the joint they move, so the muscles that bulge the forearm are mainly the flexors and extensors of the wrist and hand. The flexors and pronators form the inner mass at the elbow, the extensors and supinators form the outer mass.

Both the above masses arise from the condyles of the humerus, which is the bone of the upper arm. The part of the humerus near the shoulder is rounded and enlarged, where it joins the shoulder blade. The lower end is flattened out sideways to give

attachment to the ulna and radius, forming the condyles. The shaft itself is straight and nearly round, and is entirely covered with muscles except at the condyles.

The Shoulder—The deltoid muscle, triangular in shape, gives form to the shoulder. Just below the base is a ripple which marks the head of the arm bone. The masses of the shoulder, arm, fore arm and hand do not join directly end to end with each other, but overlap and lie at various angles. They are joined by wedges and wedging movements. Constructing these masses first as blocks, we will have the mass of the shoulder, or deltoid muscle, with its long diameter sloping down and out, leveled off at the end, its broad side facing up and out, its narrow edge straight forward. The mass of the forearm overlaps the end of the arm on the outside by a wedge that rises a third of the way up the arm, reaches a broad apex at the broadest part of the forearm and tapers to the wrist, pointing always to the thumb, and on the inside by a wedge that rises back of the arm and points to the little finger. In the lower half of the forearm, the thin edge of the mass, toward the thumb, is made by a continuation of this wedge from the outside. In the back view of the arm, the mass of the shoulder sits across its top as in the front view.

The Neck—Curving slightly forward, the neck rises from the sloping platform of the shoulders. The strength of the neck is at the back of the head, this portion being somewhat flat and overhung by the base of the skull. The sternomastoid muscles descend from the bony prominences back of the ears to meet almost at the root of the neck, forming a triangle whose base is the canopy of the chin. In this triangle below is the thyroid gland, larger in women, and above it the angular cartilage of the larynx, or Adam's apple, larger in men.

The Head—Both the oval and the cube have been used by artists as a basis for drawing the head, but the cube seems preferable in that the oval is too indefinite and offers no points for comparison, no basis for measurement, and the eye does not fix on any point in a curved line. The block not only carries the sense of mass, but provides a ground plan on which any form may be built, as well as its perspective and foreshortening. The element of bilateral symmetry enters the drawing of the head. A vertical line in the centre divides the head or the trunk into parts equal, opposite and complementary. The right eye is the counterpart of the left, the two halves of the nose are symmetrical, the limbs, except for changes of position, are nearly exact though reversed duplicates of each other.

The cranium, the skeleton of the face, and the jaw constitute the masses of the head. Into the rounded mass of the cranium sets the narrower mass of the forehead bounded by the temples at the sides and by the brows below. From the lower outer corners of the forehead the wedge of the cheek bones begins, moves outward and downward until it just passes the curve of the cranium, then down and in, in a long sweep, to the corner of the chin. The two cheek bones together form the central mass of the face, in the middle of which rises the nose.

The planes of the head are those of the forehead, sloping upward and backward to become the cranium. The sides turn sharply to the plane of the temples. The plane of the face, divided by the nose, is broken on each side by a line from the outer corner of the cheek bone to the centre of the upper lip, making two smaller planes. The outer of these tends to become the plane of the jaw, which is again divided, etc. The relations of these masses and planes is to the moulding of a head what architecture is to a house. They vary in proportion with each individual and now must be carefully compared with a mental standard.

The Eye—Below the eyebrow, on the lid, are three planes, wedging into each other at different angles. The first is from the bridge of the nose to the eye. The second is from the brow to the cheek bone, which is again divided into two smaller planes, one sloping toward the root of the nose, the other directed toward and joining with the cheek bone. The lower lid is stable, it is the upper lid that moves. It may be wrinkled and slightly lifted inward, bulging below the inner end of the lid. The cornea is always curtained by the upper lid, in part. The immovable masses of the forehead, nose and cheek bones form a strong setting for

the most variant and expressive of the features.

The Nose—The bony part of the nose is a very clear wedge, its ridge only half the length of the nose. The cartilaginous portion is quite flexible, the wings being raised in laughter, dilated in heavy breathing, narrowed in distaste, and wings and tips are raised in scorn, wrinkling the skin over the nose.

The ears, the mouth, the lips, and the chin, all offer variations in construction, and it is through comparison with others that the art of drawing them can best be acquired.

The Trunk—The upper part of the body is built around a bony cage called the thorax, conical in shape, and flattened in front. The walls of this cage are the ribs, twelve on each side, fastening to the spine behind and to the sternum or breast bone in front. The first seven are called true ribs, the next three false, and the last two floating ribs. The masses of the torso are the chest, the abdomen or pelvis, and between them the epigastrium, the first two comparatively stable, the middle one quite movable. The shoulders are also movable, changing the lines of the first mass and bulging the pectoral muscles, but the mass itself changes little except the slight change in respiration. The mass of the abdomen is even more unchanging.

The Torso—In profile the torso presents three masses: the chest, the waist and the abdomen. The mass of the chest is bounded above by the line of the collar bones, below, by a line following the cartilages of the ribs. This mass is widened by the expansion of the chest in breathing, and the shoulder moves freely over it, carrying the shoulder blade, collar bone and muscles. The back view of the torso presents numerous depressions and prominences, due to its bony structure and the crossing and recrossing of a number of thin layers of muscles. The outside layers manifest themselves only when in action, and for this reason the spine, the shoulder-blade, and the hip bone are the landmarks of this region.

The Lower Limbs—The thigh, the leg, and the foot constitute the lower limb. The thigh bone is the longest and strongest bone of the body, and the mass of the thigh is inclined inward from hip to knee, and is slightly beveled toward the knee from front, back and outside. Below the knee is the shin bone, the ridge of which descends straight down the front of the leg, a sharp edge toward the outside, a flat surface toward the inside, which at the ankle bends in to become the inner ankle bone. The outer bone of the foreleg soon overlies by a gracefully bulging muscular mass, emerges again to become the outer ankle bone. Two large muscles form the mass on the back of the leg.

The Foot—In action, the foot comes almost into straight line with the leg, but when settling upon the ground it bends to keep flat with the ground. A series of arches form the symmetry of the foot, the function of these arches being that of weight-bearing. The five arches of the foot converge on the heel, the toes being flying buttresses to them. The balls of the foot form a transverse arch. The inner arches of the foot are successively higher, forming half of a transverse arch whose completion is in the opposite foot. (See COMPARATIVE ANATOMY, ILLUSTRATION, SCULPTURE.)

LITHOGRAPHIC CRAYON DRAWING BY WARREN E. COX

This drawing was especially prepared by the author of this article to show the appeal which is obtainable through the proper observance of the fundamental laws of structure movement and composition. The structure of the old tree clearly suggests its struggle against the prevailing winds. The movement of the foliage and grasses is immediate and vital. This movement is aided by the slower movement of the clouds and the even slower movement of the sand dunes and is opposed by that of the tree branch to the right, the dead stick in the sand and the boulder to the left, all of which only help to indicate the strength of the wind. The composition is well balanced but made dynamic by the small tree placed at the extreme left just disappearing off the picture as does the crow described on the Japanese screen in the text. By the use of these elements the artist has attempted to give the feeling that the sea is just out of sight over the dunes.

Elementary—The young artist is primarily interested in making drawings of people, faces and particularly, profiles. A series of charts giving the simple and fundamental rules of proportion is shown as a practical means of starting him in this art

For the profile, a square is drawn and divided into four equal squares, and the eyes, nose, mouth, chin and ear are placed upon this chart as shown in the progressive illustrations. When the head is complete, the student will discern the egg shape, which is his first and constant principle, and which should be practised constantly until an egg can be drawn perfectly with one sweep of the hand. Proportions can soon be found on an egg shape without the aid of a square. Next, the full face is attempted, following the same principles of proportion. It will be observed that the eyes divide the width of the egg-shape into approximately five equal spaces. The two-thirds view and all other variations of the

human head should be drawn by means of the egg. With the profile the beginner will discover that all types of heads, fat, thin and old, may be drawn over the square chart with only minor variations in line. The baby and the gorilla are opposite extremes and point exceptions to the rule for placing the eye on the half way point

The "Greek Ideal" divided the human figure into eight divisions, each equal to one head in height, but actually it is seven and one half heads high. The woman's head is smaller, but the divisions of the body are in similar proportion. Note that in the figure of the man the shoulders are wider than the hips, and the woman's hips are wider than her shoulders

Taking up these two figures in action, the young artist must learn to look at the figure as a whole, he must consider the one line which expresses the motion he desires, and forget that the figure is made of arms and legs and torso

The young artist must also consider balance. The distribution of weight is directly over the feet, no matter how heavy the load. Without carrying a weight, the chin of the figure is directly over the foot which sustains the weight

DRAWING, ENGINEERING, the general term for the drawing used in the industrial world by engineers and designers, mechanical, architectural, structural, etc., is the formula in which is expressed and recorded the ideas and information necessary for the building of machines and structures. It is distinguished from drawing as a fine art in that it is not pictorial representation but a complete graphical language in which exact and positive information is given regarding every detail of the structure or machine to be built. Since it describes the object as it actually is to be and does not show it in pictorial form as it would appear to the eye it can be read and understood only by one trained in its use. When this language is written exactly and accurately it is done with the aid of mathematical instruments and is called *mechanical drawing*. When done freehand it is known as *technical sketching*. As it cannot be read aloud like a written language it must be interpreted by forming a mental image of the subject represented, and the engineer in reading a drawing that would appear to be only a complicated mass of lines has as clear a picture of the structure standing in space as if it were actually before him. Apart from its practical utility, the value of teaching drawing in the schools is in the training of this constructive imagination, the perceptive ability to think in three dimensions, to visualize quickly and accurately, to build up a clear mental image, a training useful not only to professional designers but to all who may be interested in technical industries

The basis of engineering drawing is orthographic projection, which may be defined as the method of representing the exact shape of an object by two or more views on planes at right angles to each other, by dropping perpendiculars from the object to the planes. There are two systems in use, the first and older is

FIG 1—THE THEORETICAL PLANES OF PROJECTION SHOWING THE FOUR ANGLES

first angle projection, in which the object is assumed to be placed in the first quadrant of the four dihedral angles formed by the intersection of two reference planes called the co-ordinate planes or planes of projection, fig 1 (cf. DESCRIPTIVE GEOMETRY), and its points projected to these planes, the horizontal plane (H) then revolved to coincide with the vertical plane (V), the two being represented by the plane of the drawing paper. A third or profile plane (P) perpendicular to the H and V planes is used for a third view if necessary. Fig 2 shows an object in the first angle and fig 3 the resulting arrangement of views when the planes are opened. This is the system in present use in Great Britain and other European countries except the Netherlands. It was used in the United States until about 1890 when the industrial works began to change to the newer system of *third angle projection* which in a few years entirely replaced the former method. It is significant that this movement originated in the shops instead,

of in the colleges, after experiments with workmen demonstrated that they could read third angle drawings much more easily than those made in the first angle.

Third angle, or, as it is called in Europe, American projection, assumes the object to be placed in the third quadrant of the co ordinate planes, and the observer to be looking through the planes at the object, as shown in fig 4. These planes when opened into one plane give an arrangement of views as in fig 5. Thus the object may be thought of as surrounded by a glass box with its sides hinged to each other (fig 6), the object projected to these sides and the box opened up into one plane. In both systems the projection on the front plane is known as the *front view*, *elevation or vertical projection*, that on the top plane the *top view*, *plan or horizontal projection*, that on the side plane as the *side view* or *end view*, *side or end elevation or profile projection*. For a simple object two views are often sufficient, others may require three or more. Sometimes the left side view can be used to better advantage than the right side. In some cases the bottom view, and more rarely the back view will be required. Fig 7 shows the box as it opens and indicates the positions of these different views.

It is a growing practice in the United States to teach elementary projection drawing without reference to the planes of projection, by explaining that the problem is to represent a solid, with three dimensions, on a flat sheet of paper having only two dimensions, in such a way as to tell its exact shape, and that this is done by drawing a system of "views" of the object as seen from different positions and arranging these views in a definite manner, each view showing two of the three dimensions. Taking, for example, the block shown in pictorial form in fig 8, if the observer imagine himself as in a position directly in front (theoretically at an infinite distance, practically at a reasonable seeing distance but imagining the rays of light from each point to his eye as parallel) its front view would appear as in fig 9a. This view tells the length and height but not the width of the block nor the depth of the notch. Then let the observer change his position so as to look down from directly above the block. He will see the top view (fig 9b), giving the length and width, and the shape of the notch. It is necessary to have another view from the side in this case to show the shape of the triangular part. Fig 9c is the right side view. These three views arranged in their natural position with the top view directly above the front view and the right side view to the right of the front view, completely describe the shape of the block. Note that in the top and side views the front of the block always faces toward the front view.

The argument for this teaching method is that the student visualizes the object itself without being confused in trying to visualize the projections. Its success is indicated in that some engineering schools are now teaching the whole subject of descriptive geometry without using the reference planes.

Reading a Drawing.—A line on a drawing always indicates either an intersection of two surfaces, as in the projection of a prism, or a contour, as in the projection of a cylinder (fig 10), a visible edge being represented by a full line and an invisible one

by a "dotted" line, *i e.*, a line made up of short dashes. One can not read a drawing by looking at one view. Each line on the view (except a contour line) denotes an abrupt change in direction, but the corresponding part of another view must be con-

sulted to tell what the change is. For example, a circle on a front view might mean either a hole or a projecting boss. A glance at the side view or top view will tell immediately which it is. In reading a drawing one should first gain a general idea of the shape of the object by a rapid survey of all the views given, then should select for more careful study the view that best shows the characteristic shape, and by referring back and forth to the adjacent views see what each line represents. In looking at any view one should always imagine that it is the object itself, not a flat projection of it, that is seen, and in glancing from one view to another the reader should imagine himself as moving around the object and looking at it from the direction the view was taken.

Auxiliary Views.—A surface is shown in its true shape when projected on a plane parallel to it. In the majority of cases an object may be placed with its principal faces parallel to the three reference planes and be fully described by the regular views. Sometimes however the object may have one or more inclined faces whose true shape it is desirable or necessary to show, especially if irregular in outline. This is done by making an auxiliary view looking straight against the surface, that is, imagining a projection on an extra or auxiliary plane parallel to the inclined

FIG. 6—TRANSPARENT BOX ILLUSTRATING THE THEORY OF THIRD ANGLE PROJECTION

FIG. 7—THE BOX PARTLY OPENED INTO THE PLANE OF THE PAPER SHOWING THE RELATIVE POSITIONS OF TOP FRONT LEFT RIGHT REAR AND BOTTOM VIEWS

surface, therefore perpendicular to the same reference plane to which the inclined surface is perpendicular, and revolving it into the plane of the paper. There are three kinds of auxiliary views, *first auxiliary elevations* (fig 11), made on planes which are perpendicular to the horizontal plane but at an angle with the vertical plane, or in other words the kind of views that would be seen if one walked around the object starting from the position at which the front view is seen. Thus an auxiliary elevation would have the same height as the front view. The second kind, called sometimes *left and right auxiliary views*, are used much more frequently. They are made on planes perpendicular to *V* but inclined to *H*. Fig 12 is an example, showing that the width of the auxiliary view is the same as the width of the top view. Third, *front and rear auxiliary views*, on planes perpendicular

FIG. 8—DIRECTION OF VIEWS

lar to the profile plane but inclined to H and V , in which the width of the auxiliary view is the same as the width of the front view (fig 13). Often an auxiliary view will save making one or more of the regular views and at the same time show the shape or construction of the object to better advantage. They are used extensively in the drawing of machine parts and usually are only partial views showing the inclined surface alone. In fig 14 a front

FIG 9—FRONT, TOP AND RIGHT SIDE VIEWS OF BLOCK

FIG 10—INTERSECTION LINES AND CONTOUR LINES

FIG 11—AUXILIARY ELEVATION PROJECTED FROM TOP VIEW

A *working drawing* is a drawing that gives all the information necessary for the complete construction of the object represented. It includes (1) The full representation of the *shape* of every part of the object (orthographic projection). (2) The *size* of every part, in figures (dimensioning). (3) Explanatory notes giving

view, partial top view and two partial auxiliary views, describe the shape of the piece in the simplest way.

Sectional Views—When an object is solid or the interior simple the invisible parts can be represented satisfactorily by dotted lines, but if there is much interior detail, especially if the object is made in more than one piece, the dotted lines become

confusing and hard to read. In such cases a view is made "in section," as if for that particular view a part of the object were supposed to be cut away and removed, exposing the interior. This view is known as a sectional view or simply a *section*. If the object is symmetrical the cutting plane is usually passed through one of the main axes and the front half imagined as removed. The exposed cut surface of the material is indicated by "section-lining" or "cross hatching" with uniformly spaced fine lines. It must be understood clearly that in thus removing the

front portion in order to show the sectional view this portion is not removed from the other views. Fig 15 shows in pictorial form a casting intersected by a cutting plane and its appearance when the front half is removed, fig 16 shows the two views of the casting, the front view in section. The edge of the cutting plane is indicated by the line symbol of a dash and two dots, with reference letters and arrows showing the direction in which the view is taken. The cutting plane need not be in a single con-

tinuous plane but may be offset in any part of its length to go through some detail. Shafts, bolts, nuts, keys, rods, rivets and the like whose axes occur in the plane of the section are left in full and not sectioned. Adjacent pieces are section lined in opposite directions, and are often brought out more clearly by varying the pitch, using closer spacing for smaller pieces. The same piece in different views or in different parts of the same view should always be section lined identically in direction and spacing. A common and economical way of showing an object which is symmetrical about a centre line is by making what is called a *half section*, drawing one side in section and the other in full. In such a view dotted lines are unnecessary. *Revolved sections*, made by passing a cutting plane through some detail such as a rib or the arm of a wheel and turning it in place are often used (fig 17). *Detail sections* are for the same purpose but in

stead of being drawn on the view they are set off to some adjacent place on the paper. The cutting plane, with reference letters, should always be indicated. *Phantom sections* are exterior views with the interior construction brought out by dotted cross hatching.

A *working drawing* is a drawing that gives all the information necessary for the complete construction of the object represented. It includes (1) The full representation of the *shape* of every part of the object (orthographic projection). (2) The *size* of every part, in figures (dimensioning). (3) Explanatory notes giving

specifications as to materials, finish, etc. (4) A descriptive title. Often as in architectural and structural drawing the notes of materials and workmanship are too extensive to be lettered on the drawings so are made up separately in typewritten or printed form and are called the *specifications*, hence the term "drawings and specifications." Working drawings are divided into two general classes, *assembly drawings* and *detail drawings*. An assembly drawing is, as its name implies, a drawing of the machine or structure put together, showing the relative positions of the different parts (fig 18). Its particular use is in the erection of the structure. It may give the all-over dimensions and distances from centre to centre or part to part of the different pieces, showing their relation to each other, usually indicating the different parts by "piece numbers," often enclosed in circles. It frequently includes a "bill of materials," a tabulated statement of all the parts used, including stock parts such as bolts, screws, cotter pins, etc. Classified under the general term of assembly drawings would be other forms, as the *design drawing*, the preliminary layout, full size if possible, on which the scheming, inventing and designing are worked out accurately after freehand sketches and calculations have determined the general idea. From it the detail drawings of each piece are made. Sometimes the finished assembly drawing is traced from the design drawing, more often it is redrawn, perhaps to smaller scale to fit a standard sheet, using the detail drawings to work from, thereby checking their correctness. An *outline assembly* is used to show the appearance of the machine, sometimes for catalogue or other illustrative purposes. Piping, wiring and oiling diagrams are also forms of assembly drawings. An *assembly working drawing* showing fully the dimensions and construction of each piece as well as their relative positions, so that no separate detail drawings are needed, may be made for a simple machine. A *mini assembly drawing* is a drawing of a related group of parts, in a complicated machine or structure.

FIG 12—RIGHT AUXILIARY VIEW PROJECTED FROM THE FRONT VIEW

FIG 13—FRONT AUXILIARY VIEW PROJECTED FROM SIDE VIEW

A *detail drawing* is a complete description of each separate piece, giving its shape, size, material and finish, what shop operations are necessary, what limits of accuracy are demanded and how many of each are wanted (fig 19). Sometimes smaller parts of the same material or character are grouped together, as forgings on one sheet, special bolts and screws on another, etc., but in large production the accepted practice in a set of drawings is to have each piece, no matter how small, on a separate sheet.

In commercial drafting, accuracy and speed are the two requirements. The drafting room is an expensive department. There are therefore many conventional methods or idioms and abbreviations of the language, with which the draftsman must be familiar. There are also allowable violations of the strict principles of projection when added clearness may be gained. One of the time-saving conventions is in the representation of screw threads. The helical curves are never drawn except on screws of very large diameter, but are conventionalized into straight lines, and on screws less than perhaps an inch in diameter the thread contours are omitted, the threaded portion of a shaft being represented by one of a number of conventional symbols, of which three are shown in fig 20, 4 being the commonest. As another example, in making working drawings of gears and toothed wheels the

FIG 14—FRONT VIEW WITH PARTIAL TOP VIEW AND PARTIAL AUXILIARY VIEWS

in making working drawings of gears and toothed wheels the

FIG 18—ASSEMBLY DRAWING WITH PIECE NUMBERS

teeth are not drawn but are represented by drawing the pitch circle, addendum and root circles. On detail drawings for cast gears the full size outline of one tooth is added and for cut gears the blank is drawn with notes and dimensions giving full information

FIGS 15 & 16—SHOWING THE CUTTING PLANE AND SECTION ON A

On patent drawings, however, all the teeth on a gear must be shown

Fig 21 is an illustration of the violation of theory, in which the true projection of the sectional view is not as good an explanation of the piece as the preferred form in the second view. When a cutting plane passes through a rib (fig 22), a true section, *A*, is heavy and misleading. The usual method is to omit the section lines from the rib, *B*, as if the cutting plane were just in front of it. Another method sometimes used is to section the rib as at *C*. There have been a number of different codes of symbols proposed and published for the indication of different metals and materials in section, but there is no established universal standard. At the present time, however, all the countries where drawings are made have either officially adopted each its own standard set of rules and symbols for all the conventions used in drawing, as threads, finish, dimensioning, materials, etc., or are working on such standards through the Government or the engineering societies.

Scales.—In representing objects which are larger than can be drawn to their natural or "full size" on the paper, it is necessary to reduce the dimensions on the drawing proportionally, and for this purpose the so called architect's drawing proportion feet and inches is used. The first reduction is to what is commonly called "half size," or correctly speaking "to the scale of 6"=1". This

FIG 17—A REVOLVED SECTION

scale reduction is used on working drawings even if the object be only slightly larger than could be drawn in full size, and is generally worked with the full size scale by halving the dimensions. If this is too large for the paper the drawing is made to the scale of 3"=1", commonly called quarter size. This is the first scale of the usual commercial set. Others are 1 1/2", 1", 3/4", 3/8", 3/16", 1/8", and 1/32" to the foot. Drawings to odd proportions as

FIG 19—DETAIL DRAWING

9"=1", 4"=1", etc., are not used except in rare cases when it is desired to make it difficult or impossible for a workman to measure them with an ordinary rule. The scale 3"=1" is a usual one for ordinary house plans and is often called by architects "quarter inch scale," meaning not quarter size but that one-quarter inch on the drawing represents one foot on the building. For plotting and map drawing the civil engineer's scale of decimal parts, 10, 20, 30, 40, 50, 60, 80, 100 to the inch, is used but this scale should never be used for machine or structural work. Drawings in the metric system are not made to half size or quarter size. The first regular scale smaller than full size is one-fifth size, then one-tenth size, although sometimes the scale of 1 to 2 1/2 is used. The unit of measurement is the millimetre and figures are all understood to be millimetres, without any indicating mark.

Dimensioning.—After the correct representation of the object by its projections, that is, telling the *shape*, the entire value of

FIG 20—THREAD SYMBOLS

the drawing as a working drawing lies in the dimensions, *i.e.*, telling the size. Successful dimensioning requires not only a knowledge of the principles and conventions but an acquaintance with the shop processes which enter into the construction. A dimension line is usually made as a fine full line terminated by carefully made arrow heads which indicate exactly the points to which the dimension is taken. Some use a dash line and some a red line for dimension lines. On machine drawings a space for the

FIG. 21—TRUE SECTION AND ITS PRACTICAL MODIFICATION

figures is left in the dimension line, in structural and much architectural practice the figure is placed above a continuous dimension line. Extension or witness lines not touching the outline, indicate the distance measured when the dimension is placed outside the figure.

In dimensioning there are some conventional practices which have come to represent good form to such an extent as to have the force of rules.

1. Dimensions on horizontal and inclined dimension lines should read from left to right, those on vertical lines from bottom to top, *i.e.*, so as to be read from the right hand side of the sheet.
2. Preferably keep dimensions outside the view unless added clearness, simplicity and ease of reading will result from placing them inside. They should for appearance's sake be kept off the cut surfaces of sections. When necessary to be placed there the section lining is omitted around the numbers.
3. Feet and inches are designated thus, 5'-3". When a dimension is in even feet it is indicated thus 5'-0".
4. Fractions are always made with horizontal division lines.
5. Dimensions should generally be placed between views.
6. Do not repeat dimensions unless there is a special reason for it.
7. Do not crowd dimensions.
8. In general give dimensions from or about centre lines. Never locate holes or other machine operations from the edge of unfinished castings.
9. Never give dimensions to the edge of a circular part but always from centre to centre.
10. If it is practicable to locate a point by dimensioning from two centre lines do not give an angular dimension.
11. Never use a centre line as a dimension line.
12. Never use a line of the drawing as a dimension line.
13. Do not allow a dimension line to cross an extension line unless unavoidable.
14. The diameter of the "bolt circle" of holes in circular flanges is given, with the number and size of holes.
15. Give the diameter of a circle, not the radius.
16. Give the radius of an arc, marking it *R* or *Rad*.
17. Never place a dimension so that it is crossed by a line.

Fits and Tolerances.—With the demand for interchangeability and quantity production the exact size in decimals is specified for "essential dimensions" with the amount of "tolerance" over and under which will be allowed by the inspector, since it is not possible to work to an absolutely accurate dimension. These limits are set by the engineering department and placed on the drawing, and the shop follows orders explicitly. In fitting one piece with another, as a shaft and hub, the diameters in decimals with allowed tolerances are given for each, superseding the older practice of leaving the amount of allowance for different kinds of fits to the machine shop. Much experience in manufacturing is needed as well as a study of the particular mechanism involved before the draughtsman is able to know just the accuracy necessary and to specify proper tolerance. When unnecessarily small tolerances are set the cost of manufacture is greatly increased. The

general tolerance is often stated in a note near the title.

Checking.—Before being sent to the shop a working drawing is carefully checked for errors and omissions. A first check of the pencil drawing is made by the chief designer, who knows the price at which the machine is to be made and checks the design and its mechanism for soundness and economy, sees if existing patterns for any parts can be used, checks for correct representation, *e.g.*, adequate lubrication. He sees that every piece is correctly described, checks all dimensions by scaling and computation, checks for tolerances, checks for finishes, checks for specifications of material, looks for interferences and clearances, sees that small

FIG. 22—A, TRUE SECTION THROUGH A RIB; B, THE USUAL METHOD OF DRAWING SUCH SECTION; C, AN ALTERNATE METHOD

details are standard and stock sizes where possible, checks the title and bill of material.

Working drawings are always duplicated for shop use by some printing process, and the original is not allowed to be taken out of the office. The great majority are blueprinted. Photostat prints, and reproductions made by various forms of gelatine, stencil and lithographic processes are also used. Drawings are usually made in pencil on cream or buff detail paper and traced, either for economy on tracing paper, or on tracing cloth, a transparentized cotton fabric which gives a better print and is much more durable.

One plane Projection.—Orthographic projection with its two or more views describes an object completely, but requires an effort of the geometrical imagination to visualize its appearance. On the other hand, a picture of the object showing it as it would appear to the eye can be made by perspective drawing, but is not useful as a working drawing as its lines cannot be measured directly. To obtain the pictorial effect of perspective drawing with the possibility of measuring the principal lines several kinds of one plane projection or conventional picture methods have been devised. With the combined advantages are some serious

FIG. 23—ISOMETRIC PROJECTION OF A CUBE

disadvantages which limit their usefulness. They are distorted until the appearance is often unpleasant, only certain lines can be measured, the execution requires more time, and it is difficult to add many figured dimensions, but with all this, a knowledge of these methods and facility in their use is of great value to the draughtsman. Mechanical or structural details not clear in orthographic projection may be drawn pictorially or illustrated by supplementary pictorial views. Technical illustrations, patent office drawings, layouts, piping and wiring diagrams, preliminary free-hand sketches, etc., can all be done advantageously in one plane projection. Aside from perspective drawing there are two general divisions of pictorial projection, *axonometric projection* with its divisions into isometric, dimetric and trimetric, and *oblique projection* with several variations.

Axonometric projection theoretically, is simply a form of orthographic projection in which only one plane is used so placed with relation to the object that a rectangular solid projected on it would show three faces. Usually the object is considered as turned from

its natural position and the vertical plane taken as the plane of projection. Imagine a vertical plane with a cube behind (or in front) of it, having one face parallel to the plane. Its projection will be a square. Rotate the cube about its vertical axis through any angle less than 90° , the projection will now show two faces, foreshortened. From this position tilt the cube forward any amount and three faces will show on the projection. There are thus an infinite number of axonometric positions, only a few of which are ever used as a basis for drawing. The simplest of these is the "isometric" (equal measures) position, where the three faces are foreshortened equally, as would occur if the cube were rotated about the vertical axis through 45° , then tilted forward until the edge OC (fig. 24) is foreshortened equally with OA and OB , thus making the body diagonal from O perpendicular to the plane of projection. (This makes the top face slope $35^\circ-16'$ approx.) The three lines of the front corner, OA , OB , OC , make equal angles with each other and are called the isometric axes. Since parallel lines have their projections parallel, the other edges of the cube will be respectively parallel to these axes. Any line parallel to an isometric axis is called an isometric line. The planes of the faces of the cube and all planes parallel to them are called isometric planes. It will thus be noticed that any line or plane which in its regular orthographic projection is perpendicular to either of the reference planes, will be in an isometric line or plane. In this isometric projection the lines have been foreshortened to approximately $\frac{1}{3}$ of their length and to measure them would require a special scale. In all practical use of the isometric system this foreshortened scale is not used but the full scale lengths are laid off on the axes. This gives a figure slightly larger but of exactly the same shape and is called *isometric drawing*. As the effect of increased size is usually of no consequence and the advantage of measuring the lines with standard scales is of such great convenience, isometric drawing is used almost exclusively instead of isometric projection. In making an isometric drawing the axes are first drawn, 120° apart, drawing one vertical and the other two with the 30° triangle. On these three lines are measured the length, breadth and thickness of the object. Lines not parallel to one of the isometric axes are called non isometric lines. The one important rule is, measurements can be made only on isometric lines. Since a non isometric line does not appear in its true length as a straight line, the line is located by isometric coordinates. A circle on any isometric plane will appear as an ellipse, and is usually drawn as a four centred approximation with the construction of fig. 24. It is sometimes desirable to show the lower face of an object, by tilting it back instead of forward, and drawing it on reversed axes. Fig. 25 shows a sketch on reversed axes. Isometric drawings are from their pictorial nature usually outside views but sometimes an isometric section or half-section can be employed to good advantage. The cutting planes are taken as isometric planes. Fig. 26 is a half section, made by outlining the figure, then cutting out the front quarter.

The reference cube can be turned into any number of positions where two edges would be equally foreshortened and the third to a different length, and any one of these positions might be taken as a basis for a system of *dimetric drawing*. A simple dimetric position is one with the ratios $1 : 1 : \frac{1}{2}$. In this position the tangents of the angles of the axes are $\frac{1}{2}$ and $\frac{1}{2}$ making the angles approximately

FIG. 24—ISOMETRIC CIRCLE FOUR CENTRED APPROXIMATION

FIG. 25—ISOMETRIC SKETCH ON REVERSED AXES

FIG. 26—ISOMETRIC HALF SECTION

7 and 41 degrees. Fig. 27 is a drawing in this system. *Trimetric drawing*, with three unequal axes, has little if any practical value. *Oblique Projection* is a one plane method in which the projecting lines are parallel but make an angle other than 90° with the picture plane. Suppose the reference cube to be set with one face parallel to the picture plane and the projectors to make an angle of 45° with the plane, in any direction. The face parallel to the picture plane would be projected in its true size and the edges perpendicular to the plane would be projected in their true length. This system with 45° projectors is sometimes called *cavalier projection*. It is similar to isometric drawing in having three axes representing three mutually perpendicular lines, upon which measurements can be made. Two of the axes are always at right angles to each other, being in a plane parallel to the picture plane. The third or cross axis may be at any angle, 30° or 45° being generally used. Any face parallel to the picture plane will evidently be projected without distortion, an advantage over isometric of particular value in the representation of objects with circular or irregular outline, thus objects should always be placed with their characteristic contour parallel to the picture plane (fig. 28). Oblique drawing always gives the distorted effect of excessive thickness. A variation called *cabinet drawing* devised to overcome this effect is an oblique projection, with the projectors assumed at such an angle that all measurements in the direction of the cross axis are reduced one half (fig. 29), which makes easy measurement but the effect is often too thin. Other ratios such as $\frac{2}{3}$ or $\frac{3}{4}$ may be used with more pleasing effect. The cross axes may be at any angle, but are usually made either 30° or 45° . A special system of oblique projection called *clinographic projection*, used in drawing mineral crystals in crystallography, is based on the axes of a cube first revolved about a vertical axis through an angle whose tangent is $\frac{1}{2}$, then projected obliquely to the vertical plane with the eye (at an infinite distance) elevated through an angle whose tangent is $\frac{1}{2}$.

Execution.—As drawing instruments are used for all accurate work, the first requirement in making a drawing is the ability to use them with facility and in good form. The drawing table, with softwood top or carrying a softwood drawing board, should be set so that the light comes from the left, the paper held in place with thumb tacks, and a hard pencil selected, sharpened to a long sharp point. A T-square, 45° and $30^\circ-60^\circ$ triangles, compasses, dividers, scale, pencil eraser and sandpaper pad should be at hand. Horizontal lines are drawn with the T-square guided by the left edge of the drawing board, and vertical lines are drawn with the triangle set against the T-square, always with the perpendicular edge nearest the head of the square and toward the light (fig. 30). These lines are always drawn up from the bottom to top, consequently their location points should be made at the bottom. With the triangles against the T-square, lines at 30° , 45° and 60° may be drawn, and the two triangles may be used in combination for angles of 15° and 75° , directly (fig. 31). Thus any multiple of 15° may be drawn and a circle may be divided with the 45° triangle into 4 or 8 parts, with the 60° triangle into 6 or 12 parts and with both into 24 parts. The dividers, used for transferring distances, etc., are manipulated with one hand, and opened by pinching at the chamfer with the thumb

7 and 41 degrees. Fig. 27 is a drawing in this system. *Trimetric drawing*, with three unequal axes, has little if any practical value.

Oblique Projection is a one plane method in which the projecting lines are parallel but make an angle other than 90° with the picture plane. Suppose the reference cube to be set with one face parallel to the picture plane and the projectors to make an angle of 45° with the plane, in any direction.

The face parallel to the picture plane would be projected in its true size and the edges perpendicular to the plane would be projected in their true length. This system with 45° projectors is sometimes called *cavalier projection*. It is similar to isometric drawing in having three axes representing three mutually perpendicular lines, upon which measurements can be made. Two of the axes are always at right angles to each other, being in a plane parallel to the picture plane. The third or cross axis may be at any angle, 30° or 45° being generally used. Any face parallel to the picture plane will evidently be projected without distortion, an advantage over isometric of particular value in the representation of objects with circular or irregular outline, thus objects should always be placed with their characteristic contour parallel to the picture plane (fig. 28). Oblique drawing always gives the distorted effect of excessive thickness. A variation called *cabinet drawing* devised to overcome this effect is an oblique projection, with the projectors assumed at such an angle that all measurements in the direction of the cross axis are reduced one half (fig. 29), which makes easy measurement but the effect is often too thin. Other ratios such as $\frac{2}{3}$ or $\frac{3}{4}$ may be used with more pleasing effect. The cross axes may be at any angle, but are usually made either 30° or 45° . A special system of oblique projection called *clinographic projection*, used in drawing mineral crystals in crystallography, is based on the axes of a cube first revolved about a vertical axis through an angle whose tangent is $\frac{1}{2}$, then projected obliquely to the vertical plane with the eye (at an infinite distance) elevated through an angle whose tangent is $\frac{1}{2}$.

Execution.—As drawing instruments are used for all accurate work, the first requirement in making a drawing is the ability to use them with facility and in good form. The drawing table, with softwood top or carrying a softwood drawing board, should be set so that the light comes from the left, the paper held in place with thumb tacks, and a hard pencil selected, sharpened to a long sharp point. A T-square, 45° and $30^\circ-60^\circ$ triangles, compasses, dividers, scale, pencil eraser and sandpaper pad should be at hand. Horizontal lines are drawn with the T-square guided by the left edge of the drawing board, and vertical lines are drawn with the triangle set against the T-square, always with the perpendicular edge nearest the head of the square and toward the light (fig. 30). These lines are always drawn up from the bottom to top, consequently their location points should be made at the bottom. With the triangles against the T-square, lines at 30° , 45° and 60° may be drawn, and the two triangles may be used in combination for angles of 15° and 75° , directly (fig. 31). Thus any multiple of 15° may be drawn and a circle may be divided with the 45° triangle into 4 or 8 parts, with the 60° triangle into 6 or 12 parts and with both into 24 parts. The dividers, used for transferring distances, etc., are manipulated with one hand, and opened by pinching at the chamfer with the thumb

FIG. 28

used in drawing mineral crystals in crystallography, is based on the axes of a cube first revolved about a vertical axis through an angle whose tangent is $\frac{1}{2}$, then projected obliquely to the vertical plane with the eye (at an infinite distance) elevated through an angle whose tangent is $\frac{1}{2}$.

Execution.—As drawing instruments are used for all accurate work, the first requirement in making a drawing is the ability to use them with facility and in good form. The drawing table,

with softwood top or carrying a softwood drawing board, should be set so that the light comes from the left, the paper held in place with thumb tacks, and a hard pencil selected, sharpened to a long sharp point. A T-square, 45° and $30^\circ-60^\circ$ triangles, compasses, dividers, scale, pencil eraser and sandpaper pad should be at hand. Horizontal lines are drawn with the T-square guided by the left edge of the drawing board, and vertical lines are drawn with the triangle set against the T-square, always with the perpendicular edge nearest the head of the square and toward the light (fig. 30). These lines are always drawn up from the bottom to top, consequently their location points should be made at the bottom. With the triangles against the T-square, lines at 30° , 45° and 60° may be drawn, and the two triangles may be used in combination for angles of 15° and 75° , directly (fig. 31). Thus any multiple of 15° may be drawn and a circle may be divided with the 45° triangle into 4 or 8 parts, with the 60° triangle into 6 or 12 parts and with both into 24 parts. The dividers, used for transferring distances, etc., are manipulated with one hand, and opened by pinching at the chamfer with the thumb

FIG. 29—CABINET DRAWING

and second finger. This puts them in correct position with the thumb and forefinger on the outside of the legs and the second and third fingers on the inside (fig 32). The compasses are manipulated in the same way, adjusting to the radius marked on the paper, then raising the hand to the handle and drawing the circle (clockwise) in one sweep by rolling the handle with the thumb and forefinger, inclining the compasses slightly in the direction of the line (fig 33). In making a working diagram the order of pencilling should be somewhat as follows: first, make a preliminary freehand layout sketch, estimating the position and space required for each view; second, decide the scale to be used; third, draw the centre lines for each view and block in the views with the principal outlines; fourth, finish the projections, carrying them on together; fifth, draw all dimension lines, then put in the dimensions; sixth, lay out the title, seventh, check the

FIG 30—DRAWING A VERTICAL LINE

drawing as carefully as possible

After being made in pencil, drawings, except when inked on the paper, as patent drawings or, as display drawings, are traced for reproduction. When intended to be used perhaps only once, as tool-room drawings, architectural details, etc., they are very commonly traced in firm pencil lines on tracing paper. Production drawings and works of permanent value are traced in ink on tracing cloth. The ruling pen is always used with drawing ink and guiding edge, either T-square or triangle. To fill it to touch the quill filler of the ink bottle between the nibs, being careful not to get any ink on the outside of the blades.

FIG 31—COMBINATION FOR 15° AND 75° ANGLES

The pen is held as in fig 34 and against the straight edge with the blades parallel to it and in a plane perpendicular to the paper. If the ink refuses to flow it is because it has dried and clogged in the point of the pen. If pinching the blades slightly or touching the pen on the finger does not start it, it should be wiped out and fresh ink supplied. Faulty lines may occur by pressing the pen too hard against the T-square, by sloping the pen away from the T-square, or by having it too close to the blade, when the ink will run under; by having ink on the outside of the blade, by not keeping the blades parallel to the line, or by letting the triangle slip into the wet line. Visible outlines should be strong full lines, invisible lines much lighter lines made with short dashes. Centre lines of long dash and dot, and dimension lines are made either of the same weight as invisible lines or still finer. Inking should be done in a systematic order, first, all visible circles, beginning with the smallest; second, full lines, horizontal, vertical, inclined; third, dotted circles and lines; fourth, centre lines; fifth, extension and dimension lines; sixth, arrow heads and dimensions; seventh, section lines; eighth, notes and title; ninth, border; tenth, check the tracing.

FIG 32—HANDLING THE DIVIDERS

In lettering a working drawing the two requirements are

legibility and speed. Lettering is not mechanical drawing and the use of "geometrical" letters, "block" letters, etc., made of straight lines and ruled with T-square and triangles is not approved in good practice. The "commercial gothic" or "sans serif" letter made freehand in a single stroke, either vertical or inclined is the style almost universally used.

Technical Sketching—From its use in connection with art the word sketch suggests a free or incomplete or careless rendering of some idea. This is not its meaning in engineering drawing. A sketch is a working drawing made freehand, a quick expression of graphic language, but complete in its information. In all mechanical thinking in invention, all preliminary designing, all explanation and instruction of the designer to the draftsman, sketching is the mode of expression. It represents the mastery of the language, gained only after proficiency in mechanical execution. Sketches of machine parts would be made in orthographic projection, explanatory of illustrative sketches either in orthographic or in one of the pictorial methods. Design sketches are often made on co-ordinate paper. The memory for form may be strengthened and the capacity for "stored observation" greatly increased by systematic practice in sketching from memory, studying a drawing or casting with close concentration until every detail is stored for future visualization, then making an accurate sketch without further reference to the original and comparing it when finished. See also ENGINEERING, RENDERING, ARCHITECTURAL, DESCRIPTIVE GEOMETRY, SUN COPYING, BLUE-PRINT.

FIG 34—POSITION OF THE RULING PEN

(T E F)
DRAWING AND QUARTERING, part of the penalty anciently ordained in England for treason. Until 1870 the full punishment for the crime was that the culprit be dragged on a hurdle to the place of execution, that he be hanged by the neck but not till he was dead, that he should be disembowelled or drawn and his entrails burned before his eyes, that his head be cut off and his body divided into four parts or quartered. This brutal penalty was first inflicted in 1284 on the Welsh prince David, and a few years later on Sir William Wallace. Edward Marcus Despard and his six accomplices were in 1803 hanged, drawn and quartered for conspiring to assassinate George III. The sentence was last passed (though not carried out) upon the Femans Burke and O'Brien in 1867.

DRAWING-ROOM, the English name generally employed for a room used in a dwelling-house for the reception of company. It is a shortened form of the 16th and 17th century "withdrawing-room," and originated in the setting apart of a room for the ladies of the household, to which they withdrew from the dining room.

DRAW-PLATE, a plate of hardened steel with a series of holes, with converging sides, graded in size and of similar shape, through which metal is drawn in manufacturing wire (q.v.).

DRAYTON, MICHAEL (1563-1631), English poet, was born at Hartshill, Warwickshire, and settled in London about 1590. His first volume of poems *The Harmony of the Church*, appeared in 1591, the whole edition, with the exception of 40 copies seized by the archbishop of Canterbury, was destroyed by public order. In *Idea, the Shepherd's Garland* (1593), a collection of nine pastorals, and *Idea's Mirror* (1594), a cycle of 64 sonnets, he celebrated his love for a Warwickshire lady, *The Legend of*

Purs Gaveston (1593) is the first of Drayton's historical poems, it was followed by *Mortimeriades* (1596), written in ottava rima and afterwards enlarged as *The Barons' Wars* (1603), *The Legend of Robert, Duke of Normandy* (1596), and *England's Heroical Epistles* (1597), modelled on Ovid.

Drayton had been in high favour with Elizabeth, but his overtures to James I were rejected, and his pique found expression in *The Owl* (1604), an unsuccessful satire. In 1606 he made a collection of poems entitled *Poems Lyric and Pastoral*, including among other hitherto unpublished works his famous "Ballad of Agincourt."

As early as 1598 he had formed the plan of celebrating all the points of topographical or antiquarian interest in the island of Great Britain. In 1612 the first part of this vast work was published under the title of *Poly Olbion*, 18 books being produced, to which John Selden supplied notes. The success of this, his most famous work, was at first small, and the 12 more books of the second part appeared only in 1622. This completed the survey of England, and the poet, who had hoped "to crown Scotland with flowers," and arrive at last at the Orcaades, never crossed the Tweed. In 1627 he published another of his miscellaneous volumes and this contains some of his most characteristic and exquisite writing. It consists of the following pieces: *The Battle of Agincourt*, a historical poem in ottava rima (not to be confused with his ballad on the same subject), and *The Miseries of Queen Margaret*, written in the same verse and manner, *Nymphidia, the Court of Faery*, a most graceful little epic of fairyland, *The Quest of Cynthia and The Shepherd's Sirena*, two lyrical pastorals, and, finally, *The Moon Calf*, a sort of satire. Of these, *Nymphidia* is perhaps the best thing Drayton ever wrote, except his famous ballad on the battle of Agincourt, it is quite unique of its kind and full of rare fantastic fancy.

The last of Drayton's voluminous publications was *The Muses' Eluam* in 1630. He died in London and was buried in Westminster abbey. Drayton corresponded familiarly with William Drummond, Ben Jonson, William Browne, George Wither and others were among his friends. There is a tradition that he was a friend of William Shakespeare, supported by a statement of John Ward, once vicar of Stratford-on-Avon, that "Shakespeare, Drayton and Ben Jonson had a merry meeting, and it seems drank too hard, for Shakespeare died of a feverer there contracted." He had a share, with Anthony Munday, Henry Chettle and Robert Wilson, in writing *Sir John Oldcastle*, which was printed in 1600.

The poet with whom it is most natural to compare Drayton is Daniel, he is more rough and vigorous, more varied and more daring than the latter, but Daniel surpasses him in grace, delicacy and judgment. In their elegies and epistles, however, the two writers frequently resemble each other. Drayton, however, approaches the very first poets of the Elizabethan era in his charming *Nymphidia*, a poem which inspired Robert Herrick with his sweet fairy fancies and stands alone of its kind in English literature, while some of his odes and lyrics are inspired by noble feeling and vivid imagination.

In 1748 a folio edition of Drayton's complete works was published under the editorial supervision of William Oldys, and again in 1753 there appeared an issue in four volumes. But these were very unintelligently and inaccurately prepared. A complete edition of Drayton's works with variant readings was projected by Richard Hooper in 1876, but only three volumes were completed, a volume of selection, edited by A. H. Bullen, appeared in 1883. See especially Oliver Elton, *Michael Drayton* (1905) (E G).

DREADNOUGHT. see BATTLESHIP

DREAMS. Traditionally, dreams have been defined as states of consciousness taking place during sleep. In the light of critical reflection, however, this definition is hardly adequate. Not every state of awareness occurring during sleep is classifiable as a dream state, nor is sleep in the conventional meaning of the term invariably necessary for the production of the dream consciousness. People often hear a telephone ringing even though they are asleep or dozing. Upon being fully roused, they find that what they heard in the sleep or quasi sleep state squares with external reality, since the telephone is still ringing. Such correct apprehen-

sion of genuine event is obviously not to be classified as a dream even though sleep and the apprehension were concomitant.

An essential characteristic of the dream is thus a manifest discrepancy between dream images and external reality. In other words, dreams are illusory or hallucinatory experiences and just because such experiences can take place in the absence of ordinary sleep, the adequacy of the traditional definition is to be questioned. The often mentioned case of a mirage may be cited in this connection—that of the thirsty desert traveller who perceives a clump of trees in the distance only to find the trees nonexistent upon arriving at the site of the phantased oasis. A mirage is consequently to be classified as a species of dream even though the traveller is not actually asleep.

Similarly, the experiences of some mentally sick patients, who misconstrue their hallucinations as real events, may also be classified as dreams despite the fact that the patients are by no means asleep. Their hallucinations are often responsible for the abnormality of their speech and conduct. Psychiatrists customarily interpret the abnormal behaviour of such patients by saying that they are living in a dream world. It is important to note that they do not have to be asleep in order to live in such a dream world.

The hallucinated phantasies of the insane person are very different from the ordinary daydreams of the normal person. The latter does not act out his daydreams, while the former does. This difference supplies a clue to understanding of the dream process. The daydreams of a normal person are not subject to confusion because for him the events of the daydream are correctly localized either in the past or the future. Those referring to the past are designated as reveries of the reminiscent variety while those projected into the future are referred to popularly as building air castles. The ordinary daydream thus differs from the ordinary night dream in its temporal setting, for it is characteristic of the latter to be accepted as real at the time it occurs. In technical language the temporal locus of the dream experience is the present.

In the light of the foregoing considerations it is possible to formulate a more revealing definition of the concept of dreaming. A dream is to be regarded as an illusory or hallucinatory experience whose temporal locus is the present and which is usually accepted as real or as having genuinely existential status at the time it occurs. This last qualification is necessary in order to allow for the relatively rare dreams in which the dreamer is actually or incipiently cognizant of the fact that he might be having a dream. Ordinarily, however, it is not until fully alert consciousness supervenes that the dreamer recognizes the unreal status of that which he has just experienced in his dream.

Incidentally, this unreality of dream events is also suggested by the derivation of the word dream. Etymologists trace it through the Anglo Saxon to the root meaning of the modern German word for dream, *Traum*, and the latter word is in turn related to the German verb, *trügen*, which means to deceive. By stressing the role of illusory and hallucinatory factors in the dream experience the definition just formulated tends to preserve the idea of deception implicit in the root meaning of the word.

Problems of Dream Psychology.—Interest in the nature and significance of dreaming harks back to antiquity. Soothsayers, as is well known, ventured to read prophetic import into dreams. Divination by means of dreams a recognized art in ancient times, was called *oneiromantry*. In fact, the general study of dream phenomena was called *oneirology* (From the Greek word *oneiros*, a dream). The general import of this oneirological approach may be suggested by recalling the Old Testament account of Joseph's interpretations of Pharaoh's dreams. For the unsophisticated in all ages dreams have been fraught with mystical or superstitious significance of a sort that enabled the exponent of oneiromantry to have his art taken seriously by those who consulted him. Even today so called "dream books" are purchased by the credulous for the purpose of ascertaining the presumed prophetic meaning of given dream symbols.

The modern scientific study of dream phenomena of course has nothing in common with this venerable oneirological tradition.

Scientific study of the subject was initiated in 1861 with the publication of A. Maury's study of sleep and dreams. Later investigators devoted themselves to similar application of scientific method to problems of dream psychology. For the most part these problems have had little in common with the mystical and often superstitious beliefs which the credulous of all ages have tended to associate with dreams. Instead they have had to do with questions so framed as to be amenable to study by the methods of science. The following will serve as convenient examples of such questions:

1. What is the role of internal and external stimuli in the production of dreams?
2. Is dream imagery different in kind from that of imaginative productions in daydreams and creative thinking?
3. What is the relationship between the depth of sleep and the incidence of dreams?
4. Can the duration of dreams be measured?
5. Are dreams revelatory of conscious and unconscious desires and personal conflicts?
6. Can dream symbols be interpreted in dependable fashion?
7. Are dreams produced during hypnotic sleep different from those occurring normally?
8. Do the dreams of the blind and deaf differ from those of normal people?
9. Does the frequency and nature of dreaming vary as a person grows older?
10. Does dreaming serve any useful function?

Methods Employed—In order to find the answers to questions of the foregoing sort, students of dream psychology have had recourse to varying techniques of investigation. Some have endeavored to influence the dream consciousness by pinching the sleeping subject or bringing odiferous substances close to his nostrils. The experimenter would then either arouse the subject for the purpose of securing an immediate report on his dream life or else wait until he awakened spontaneously to furnish such a report. Some experimenters applied stimuli to themselves prior to falling asleep. For example, one investigator would knot a string around his finger or keep a metronome ticking and prepare himself to observe the possible influence of such tactual and auditory disturbances on his dreams. Parenthetically, it should be noted that self observation of this kind is rendered more reliable if the experimenter keeps a pencil and notebook handy so that he can write down his observations immediately upon awakening, for dreams are fleeting and delay in recording may render it impossible to remember more than a few fragments of what had been a relatively complex dream.

Some investigators have utilized reports of dreams supplied by psychologically untrained observers. For certain purposes a direct method of this kind may furnish useful data. In studying the dreams of children, for instance, it is helpful to collect their reports of their own dreams in their own language. Furthermore, as will be amplified subsequently, the method of dream interpretation employed by psychoanalysts also takes its point of departure from the subject's spontaneous recollection of a dream that he chances to think of during the analytic hour. As developed by Sigmund Freud, this psychoanalytic approach to dream phenomena involves the method of free association. Some detail of the dream, such as a vision of a sobbing ostrich, is made the point of departure for a recital of whatever ideas chance to be associated with this detail. Anything that is either directly or remotely linked up with the notion of a sobbing ostrich is reported, and even embarrassing ideas and impulses that one would normally not talk about are brought to expression by the patient. This, in brief, illustrates the Freudian method of dream study by means of free association.

Some interesting findings have also been reported by a few psychologists using a method of experimental induction of dreams during hypnosis. The technique is rather easy to employ. Hypnosis is induced by any one of the traditional routine procedures and then the hypnotized subject is told that he will soon find himself experiencing a dream. A suggestion of this kind arouses a definite set to dream. Once this set is aroused the experimenter introduces various disturbances calculated to induce a dream. He may sound a buzzer, call out a person's name, hold a bottle of perfume near the subject's nostrils, stroke the skin surface with a tuft of

cotton, change the position of the subject's arm or leg or introduce any other kind of disturbance. Some psychologists have awakened the hypnotized subject in order to get his dream report. This is not necessary in most instances since the hypnotized subject may be made to respond to the suggestion that he supply an account of each dream as soon as he has experienced it. A cooperative subject does this without awakening from the hypnotic state. In this way a whole series of dreams may be collected during a single experimental session. By means of this technique it is also possible to get an approximate measure of the duration of a dream. All that is required is to set a stop watch in motion when the dream stimulus is applied and to stop it as soon as the subject starts his account. Using this method it was found by one investigator that the hypnotic dream averages about 30 sec. The hypnotic technique has also been used to influence the course of ordinary night dreams. This is accomplished by giving the subject a posthypnotic suggestion to dream about some specific theme on a particular night and to be sure to report the resulting dream to the investigator.

There has been some question regarding the legitimacy of comparing dreams produced during hypnotic sleep with those occurring during ordinary sleep. Phenomenologically considered, there seems to be no difference. This is equivalent to saying that there is no assured way of recognizing hypnotic dreams by mere examination of their verbatim descriptions. Furthermore, the subjects themselves, when questioned about the possible differences between their hypnotic and their ordinary dreams, seem unable to observe any decisively differentiating characteristics. Nevertheless, cautious psychologists are not yet willing to regard them as caused by precisely equivalent or identical mental processes. This reluctance is justified to the extent that experimental study has demonstrated clear cut physiological differences between natural sleep and the hypnotic trance. From the methodological viewpoint however, the ease and flexibility of the technique of inducing hypnotic dreams renders it an important and valuable adjunct to the scientific study of dream phenomena. It has supplied some revealing insights into the process of dream formation.

Depth of Sleep and Dream Frequency—In terms of the concept of fluctuations in depth of sleep a few studies have been directed at the question of the incidence of dreams as such fluctuations occur. The problem is a difficult one because of much that is unknown regarding the details of the physiology of sleep. Glossing over these difficulties, it may be sufficient to state that in investigators have tended to assume that ease of arousal is inversely related to profundity of sleep. By noting how strong a disturbance must be introduced to awaken a sleeper at different hours on different nights they were able to construct curves purporting to represent the depth of sleep. In general, the curves show the second hour of the sleep period to be most resistant to arousal of full waking consciousness. Following this second hour sleep seems to become more and more shallow as the terminal period of the sleep session is approached. A few psychologists have kept records of the number of dreams experienced at various hours during the night and the drift of their findings is to the effect that the variations in frequency parallel the sleep curve, that is, the shallower the sleep the greater the number of dreams. One study of this kind showed 75% of dreams taking place after 4 A.M.

Memory and Dreams—Despite the general agreement of these studies, there has been little agreement on their interpretation. An obvious inference that dreaming seems to be incompatible with the most profound sleep states has been questioned by some students of the subject. They would interpret the data as revealing more of a relationship between memory and depth of sleep than one referring to dream frequency. According to some of them, it is not inconceivable that a dream process of some sort characterizes the entire sleep period continuously. In the light of such a concept dreaming would be a normal concomitant of sleeping, but being able to remember one's dreams would be abnormal in the sense of being relatively infrequent in comparison with the total number of dreams occurring throughout the sleep period. An interpretation of this sort is partially supported by the fact that memory efficiency is intimately related to alert, un-

fringed wakefulness. Accuracy and control of one's memory functions is seriously disrupted by states of exhaustion. Since sleep is the sovereign remedy for fatigue, memory efficiency ought to improve toward morning, and consequently more dreams ought to be recalled as the time for waking approaches. However, this would not necessarily mean that more dreams had taken place during the terminal hours of sleep.

The crucial issue in this controversy hinges on the question of the existence of dream experiences which, by hypothesis, the dreamer is unable to recall. Because of the extreme privacy or subjectivity of the dream process, it has been difficult to furnish conclusive evidence in support of the possibility of having experienced a dream for which one is totally amnesiac upon awakening. Of course the familiar experience of being cognizant of having had a dream even though one cannot remember what it was about has some bearing on the question, but such evidence is suggestive rather than conclusive.

More convincing proof has been supplied by hypnotic dream studies. In one such study the experimenter worked with a subject who insisted that he never dreamed. He was most emphatic in his insistence that his ordinary sleep was dreamless. When the experimenter asked how he could understand the meaning of the word dream, he admitted having dreamed as a child. But he was sure of this being altogether a thing of the past. Nevertheless in hypnosis, this young man reported vivid dreams which he described in considerable detail. The report was given during hypnosis and then another dream would be aroused and another report made and so on throughout the experimental period. And yet when the subject was awakened, he insisted that no dreams had occurred. He maintained that all he could remember was being put to sleep and that nothing happened after that until he was aroused. He was seemingly completely amnesiac for the intervening period. Even when the experimenter asked leading questions about the dream events that had been described only a few minutes earlier, the subject just stared at him in uncomprehending perplexity. What is more, even reading a verbatim, stenographic account of his dreams to him failed to arouse any feelings of familiarity. Experimental sessions of this sort took place on fairly frequent occasions and the results were invariably the same: he could never remember having had a dream. It is thus possible to demonstrate the existence of hypnotic dreams which are completely refractory to recall upon awakening. This renders the application of a similar hypothesis to the ordinary night dream less of an untenable, purely speculative stab in the dark.

Content of the Dream.—It is a commonplace observation that the sequence of events in a dream episode is more bizarre than that characteristic of waking consciousness. The dreamer's control of attention, judgement, imagery and other mental functions is much reduced or altogether absent. The dream is something that happens to him as opposed to something that he does for himself or to himself. To a large extent he is a passive observer of events sweeping over him. These events are presented in the form of a phantasmagoric play of images. This should not be construed to mean that the images are exclusively visual, for psychological studies have demonstrated the variegated nature of dream imagery. Although visual and auditory imagery seems to predominate as it does in waking life, any other kind of imagery process may be woven into the fabric of the dream. In only one respect does dream imagery seem to differ significantly from the spontaneous utilization of imagery in waking life: colour and colour images are much less frequent in dreams. Experiments in which one is likely to appear in grey pictures rather than in colour. This point is not unimportant, because occasionally writers have implied that the perception of coloured images is altogether absent from the dream process. Such a statement is not in accord with fact. Coloured images do occur, but their frequency is much less frequent than the ubiquity of colour in waking experience would lead one to expect. Why there is such a striking reduction in frequency is an unsolved problem in the psychology of the dream.

Dream content is, of course, not a static but a dynamic phenomenon akin to living a series of experiencing some event. Material for the dream story comes from stimuli impinging on the dreamer at

the moment as well as from his store of past experiences and contemporary interests and urges. Often events from the dreamer's remote past may be reactivated in the dream and play a vivid role. Sometimes such reactivated experience parallels the original one without much distortion. This is an instance of what the psychologist calls reproductive imagination to designate the origins of phantasies recognizable as approximate duplicates or reproductions of prior experiences. At other times the dream experience may involve a transposition of earlier and more recent images into a novel and unique pattern of happenings akin to what psychologists classify as a product of productive or creative imagination. Dream content, it should be noted, is a product of the dreamer's past and not a fore-boding of events to come as the ancient orneurologists asserted.

This is brought out by comparison of the dreams of children with those of adults. Very young children, for example, are likely to dream of wizards and fairies, and the older child of school examinations and athletic heroes. To cite other examples: children of the destitute are likely to dream of wonderful toys, hungry people of food, homesick soldiers of their families and prisoners of freedom. The wish is father to the dream as well as to the thought. Desires, worries and other tensions may also have a direct bearing on the kind of dream content experienced.

It seems safe to assert that the language of the dream is more pictorial than linguistic. Verbal images do not loom up frequently or prominently in the course of dream content. The dreamer seems to function more like a newspaper cartoonist than like a reporter or editorial writer. The paucity of verbal content in dreams means, of course, that critical analysis or subtle reasoning is not likely to occur in dreams. Language seems to be an all most indispensable tool for such refined mental operations. Because of the restricted role of language in the dream, the thinking of the dreamer is largely limited to that which can be symbolized by nonverbal means.

Structure of the Dream.—An ordinary daydream is often regarded as a matter of idle association or reverie. The sight of a box of candy, for example, induces one to think of eating between meals, and this recalls visions of parental scoldings for raiding the icebox and this, in turn, reminds one that electrical refrigerator is certainly an improvement over the old fashioned box, etc., etc. In schematic terms this amounts to saying that the structure of waking association of a random sort follows the pattern of stem A arousing B, B eliciting C, C provoking D, etc. Is this type of structure also the structure of the dream pattern? Is the dream just a sequence of idle associations aroused in a sleeping individual by a chance stimulus such as a ringing ambulance bell or a clogged nostril? To find the answer the pattern of such free association must be compared with those dream patterns resulting from known terms of experimentally controlled stimulation. Examination of hypnotic dreams aroused by simple stimuli demonstrates that dreaming is not just a matter of free association. Although such stimuli provoke the dream pattern, the relationship between the instigating factors and the resulting pattern of response is not like the simple A B C D sequence just mentioned.

In the dream the instigating stimulus becomes a constituent feature of the pattern. It is buried within the pattern in such fashion that knowledge of the dream alone is not sufficient to enable one to ferret out the antecedent stimulus. It is as if a stimulus were to be equated by its effect. An example of this may be supplied by the hypnotic dream of one subject who dreamed that he was in a room and was visited by his sweet heart who stood next to his bed and stroked his hand. This particular dream had been touched on when the experimenter stroked the back of the subject's hand with a bit of absorbent cotton. Here the cotton of course was experienced toward the end rather than at the beginning of the dream. In another hypnotic dream another subject dreamed that he was dressed in his track suit and running for exercise when he chanced to see a dead horse by the side of the road. In this instance two stimuli had been applied simultaneously: pressure on the sole of the hypnotized subject's shoe along with a whiff of isoetrolol. The former stimulus was responsible for the idea of running and the latter for that

of the dead horse, but both ideas were woven into the pattern of the dream and even though their provocative stimuli had been presented concurrently the resulting images were not concurrent until the close of the dream.

Dreams as Trial Percepts—The fact that dreams seem to be characterized by a type of structure in which the consequences of the provocative stimuli come to be constituent features of a larger dream context is of considerable theoretic importance. It suggests that some dreams are to be explained as attempts by the dreamer to account for an ambiguous or dimly apprehended stimulus pattern in terms of whatever backgrounds of experience happen to be touched off by the stimuli in question. This phase of the dream process is analogous to the common waking experience of being startled by a strange sound while we are absorbed in a novel. A what-in-that-be attitude, as opposed to the attitude of free association, comes to dominate consciousness. For the time being the novel is relegated to a subordinate position. As the strange sound is repeated, various possibilities suggest themselves: an intruder in the attic, somebody tinkering with a car outside, a rattling venetian blind, etc. These possibilities are rejected almost as soon as they occur because the troublesome noise fails to square with these possibilities. Then the startled reader recalls having set a trap in the attic some days earlier. The curious noise is now recognized as that of a rat dragging a trap across the attic floor. This interpretation squares with the unique characteristics of the startling noise and the problem is regarded as solved. It is solved by means of a series of trial percepts brought to bear on the situation.

This utilization of trial percepts may help to account for many dreams. In sleep many stimuli that would evoke immediate recognition on the part of a waking person are blurred or ambiguous because so much of relevant sensory material is shunted out by the heightened sensory thresholds characteristic of sleep. Only fragments of a given total stimulus pattern are experienced by the sleeper. The what can that be mental set is aroused because of the stringency of such fractured stimulation. It is like trying to read a book printed with broken type. Imaginative guess work has to replace clear cut, facile perception. The dreamer, in other words, being cut off from the world of reality by heightened sensory thresholds, accepts those few sensory fragments which break through to awareness as being the core of genuine happenings interpreted in the light of whatever trial percepts are brought into play. But such interpretation differs from the same process carried out by a fully alert person, for the dreamer fails to recognize the trial or hypothetical character of the series of interpretations. What the alert person knows to be just a bare suggestion or a possibility is accepted as actual fact by the dissociated consciousness of the dreamer.

Dream consciousness, to employ a grammatical metaphor, tends to be in the present indicative. The past, the future, the perfect and the subjunctive are not utilized. For the dreamer the cognitive equivalents of "it might be," "it's as if" or "maybe this is" are largely nonexistent. The dream world is a world of the present in which what happens takes place here and now and in which all

Freud was primarily interested in the dream as an expression of dynamic trends in the life of the dreamer. It was as though Freud had asked "What can this dream mean in terms of this patient's longings, desires, wishes or urges?" An approach of this kind tends to view dreams as products of the optimistic mood. It is concerned with the assumption that dreams are to be regarded as expressions of balked wishes or frustrated yearnings. Freud regarded the dream as supplying a "royal road" to the realm of unconscious motivation. For him dreams were either actual or attempted wish fulfillments. He conceived of the sleeping individual as largely cut off from external stimulation with the critical functions of waking consciousness also shunted out for the most part, so that internal tensions, the repressed but regnant strivings of the unconscious, could find vicarious expression in the symbolism of the dream. A vicarious outlet of this kind, he held, makes its appearance in sleep because the mind's forces of inhibition are also dozing. Illicit impulses consequently would be expected to meet with less resistance from such a somnolent conscience.

An analogy may help clarify this Freudian outlook. If the tensions of the unconscious be likened to denizens of the underworld reluctant to come out of hiding into the bright light of day time reality where the police might see and recognize them, then the bright light would be analogous to the consequences of external stimulation, both visual and auditory, and the police would be comparable to the critical goals of conscience which tend to prevent one from yielding to morally repugnant cravings. In terms of later Freudian theory this policing function of conscience was attributed to the superego and the hide out of the dynamic denizens of the psychic underworld of the unconscious was known as the id. In brief, because sleep deactivates superego functions, frustrated id impulses have a better chance of expressing themselves in the drama of the dream.

To understand the drama of the dream, as Freud saw it, it is necessary to become familiar with certain distinctions he introduced. The story of a dream as it is told by an individual upon awakening is not the whole story nor the real story. Such a story supplies what Freud called the manifest content of the dream. He contrasted this with the latent content of the dream. By reverting to the preceding analogy, the difference between these two kinds of content can be made clear. An underworld crook would hesitate to come out of his retreat without disguising himself. He might dress like a priest in order to throw off suspicion. The priestly garb would then exemplify what Freud called manifest content, while the nefarious impulses lurking underneath this garb would illustrate the notion of latent content. Freudian dream interpretation thus almost invariably calls for penetration of the disguise of the manifest content of dream imagery so as to get at the core of latent dream motivation.

Penetrating such disguises the Freudian detective is on the alert for certain characteristic dodges he attributes to the strategy of id impulses. One of these is condensation or the process of giving expression to more than one impulse by means of a single dream image or symbol. For instance, the desire to cut loose from rigid convention plus the desire to dominate over one's adversary in sadistically ruthless fashion may come to symbolic expression in the form of the crooked cross of the swastika. The process is akin to what psychoanalysts sometimes call over determination, meaning that a multiplicity of motives may be responsible for a single act or a given symptom. Another of these dodges or dynamisms is that of displacement or the shift of emphasis from a revealing symbol or figure to a neutral one. For a woman to report experiencing a patriotic thrill as she perceived the British flag in her dream might serve as an example of this provided that in the course of her free associations to the idea of this flag she comes to confess a secret love for some Londoner named John. The flag, the Union Jack, would then be interpreted as a disguised expression of her unconscious longing for closer ties with John. What was experienced as a patriotic thrill in the manifest content had been a more personalized, libidinous thrill in the latent stage of its origin. Instead of expressing this erotic longing directly by means of a dream image of John, the

Freud's Dream Theory

part of Sigmund Freud's contribution to the psychology of dreaming. His views on the subject were originally expounded in his book on *The Interpretation of Dreams*, first published in German in 1900. Many critics regard this as Freud's outstanding work and Freud himself once expressed the opinion that "the most valuable" of his discoveries are to be found in this work. An enormous literature grew up in connection with Freud's brilliant approach to the dream problem.

impulse was displaced from John to the seemingly harmless image of the British flag. In actual dream interpretation the Freudian analyst thus has to work back from the symbolism of the manifest content to the motivational sources in the latent content. In doing this he must not only guard against being misled by the distortions resulting from condensation and displacement, but also against those caused by what Freud called secondary elaboration. This refers to inaccuracies in the report of the dream as made by the dreamer in order to make the account more coherent or more plausible. In other words, even the manifest content is apt to be distorted in the process of telling about the dream. Significant items may be left out and new ones may be added quite unconsciously as the narrator strives to make his story more dramatic or more plausible. Such secondary elaborations must be recognized and stopped *before* the analyst can probe into the unconscious determinants of the dream.

As has already been explained, this sort of probing is accomplished by having the patient react to specific items in the manifest dream content with whatever ideas such items chance to arouse. According to Freudian teaching the resulting train of free associations will expose a track leading to the unconscious (tension responsible both for some of the patient's neurotic symptoms as well as some of the vagaries of his dream life). Furthermore, as a result of analyzing a tremendous number of dreams, Freud found what he took to be a fairly stereotyped relationship between certain dream symbols and certain unconscious wishes. He then felt justified in speeding up the process of dream interpretation whenever such fixed symbols occurred by decoding them immediately without having recourse to the often tediously circuitous free association route. The vast majority of these standardized symbols were taken to be expressions of infantile or childish notions of sexuality. Notions of this kind are especially subject to repression because their early manifestation tends to provoke the shocked or horrified disapproval of parents. It does not take the young child long to learn of the strength and sternness of society's code of sex taboos. What he does not dare express simply has to be repressed. It is consequently easy to understand, say the Freudians, why so much of the dynamics of unconscious motivation has to do with impulses harking back to the dawn of sex curiosity. And it is precisely such impulses which Freud regarded as playing such an important role not only in neurotic behaviour, but also in dream symbolism.

Critique of Freud's Theory.—There can be no question about the brilliance, boldness and originality of Freud's contribution to the psychology of dreaming. Even though admirations of parts of his theory can be found in earlier writers, especially Plato, no previous worker dealt with dream phenomena with such profundity of psychological insight and with such speculative daring. No serious student of such phenomena can afford to neglect these insights and speculations. Almost all modern studies are grounded in them. This holds true even of those students of the subject who have seen fit to repudiate or modify the Freudian theory. In fact, many who have taken Freud's teachings as a point of embarkation have wandered far from their original psychoanalytic moorings. This applies to such men as Carl Jung, Alfred Adler, William Stekel, Otto Rank, and others. Nor have the rank and file of nonpsychoanalytically trained psychologists given Freud's dream theory their unqualified endorsement. But the thinking of all of them has been stimulated and fructified by the genius of Freud.

A whole volume would be required to furnish a detailed account of these divergent theories and these rejections and transformations of specific aspects of Freud's ingenious formulations and suggestions. However, only a bare outline of the more salient points of controversy can be introduced here. One of these points has to do with Freud's utilization of stereotyped dream symbols. Almost an army of critics has attacked this teaching so that it seems safe to say that practically all competent students reject this notion of fixed dream symbols. To be somewhat more concrete the Freudian idea of the inevitable and certain phallic import of a snake symbol is no longer endorsed. Sometimes, of course, such a symbol may have such import in a particular dream of a particular individual, but not every manifestation of this symbol in the case of any individual's dream is to be linked with phallic implications as a routine interpretation. After all, a snake may be symbolic of deception or of undulation or of the phylom of reptilia or of the Garden of Eden or a host of other notions so that to restrict its symbolic significance to representation of the male sex organ exclusively is hardly warranted. Criticism of this sort can

be applied to all other allegedly fixed dream symbols. This means that dreams cannot be interpreted by consulting so-called dream books purporting to supply a code of dream symbols.

Freud's technique of sitting at motivational determinants by means of free association has also been exposed to a barrage of criticisms. Some critics have called attention to the difficulty of finding out when to call a halt in the onward flow of the patient's associations. How is one to recognize the terminus of latent content? Others have maintained that even if latent content be reached by such a train of associations it would not follow that dream formation had taken the same associative pathway in the reverse direction. For example, a woman may dream of a game of cards in which she holds four aces. By means of free association the latter item may induce her to think in successive fashion of the four horsemen of the Apocalypse, a eucalyptus tree, a shoe tree, a shoe salesman and finally, the owner of a shoe store whom she met at a dance some months previously. Let it be further assumed that she admits having found him a very attractive person. Does it follow, the critics of this point ask, that her superstitious desire to "win the hand" of this attractive man expressed itself in the dream by the reverse sequence of associations going from the unconscious desire for the man, to a shoe salesman, to a shoe tree, to a eucalyptus tree, to the four horsemen of the Apocalypse and ending with the thrill of holding a hand with four aces? Evidence justifying an affirmative answer to this question has not been supplied to the satisfaction of these critics.

An additional phase of Freud's theory to which many critics objected was his emphasis on unconscious infantile sexuality as a preponderant source of potent dream material. This criticism, regarding criticism, is phrased as decidedly exaggerated. They would enlarge the scope of potential dream motivation to include the entire gamut of man's repertoire of lusts, aspirations, ambitions, fears, cravings and strivings. The life of conation both conscious and unconscious, is not to be compressed within the narrow confines of a child's frustrated sex curiosity.

It ought to be stated that Freud himself was not unmindful of some of these objections and sought to answer them. It ought also to be stated that his followers no longer accept the early formulation of the theory in its orthodox form. Few, if any, for instance, endorse the doctrine of fixed dream symbolism.

The attack on Freud's theory has been severe, but there are basic features of his formulation which seem to have weathered the storm of adverse criticism. These likely include Freud's emphasis on the need for a distinction between manifest and latent content, the role of such dynamics as displacement and condensation and what may possibly constitute his most penetrating use of the recognition of dream, as a dramatic projection and distorted expression of underlying personal conflicts. By thus envisaging the dream as a product of motivational tensions Freud paved the way for the development of numerous other so-called projective techniques for studying the complexities of human motivation. These methods calculated to induce people to reveal their inner preoccupations and inner conflicts by the means of what they invent to account for the meaning of pictures shown to them, by the figures they project into meaningless graphic representations of clouds or ink blots, by what they choose to draw or model when supplied with crayons or clay or by the way in which children "play house" when manipulating dolls symbolic of a family group. All such methods may be regarded as outgrowths of Freud's teaching regarding the psychological significance of the dream phantasies.

A Bipartite Theory.—It would be misleading to think of every dream as a projection of unconscious personality conflicts. A satisfactory theory of dreams must account for all dream phenomena. As a consequence, the Freudian view requires supplementation. In terms of a broad perspective, dreams may be regarded as products of two sets of factors: (1) the stream of sensory impulses that chance to spill over the heightened sensory thresholds of the sleeping person, and (2) motivational tensions which, figuratively speaking, are clamouring for expression. By taking account of these two sets of factors it ought to be possible to explain the nature of all dreaming at least in terms of a first approximation to probable scientific fact.

Understanding of this bipartite approach to dream phenomena will be facilitated by consideration of one of the just mentioned projective techniques. In confronting a person with an ink blot on a sheet of paper and asking him what the blot might be or what it makes him think of, two kinds of replies might be forthcoming.

By noting the outline of the blot he might find enough resemblance to the coast line of Australia to venture the guess that the blot can be taken to be a map of that continent. Such a response is not so much a projection of the individual's personal troubles as it is a product of his general intellectual background. It is a product of what was previously described as the what-can-thus-be type of mental set induced by strange or ambiguous stimuli. In trying to recall what is implicit in every act of difficult perception such as trying to recall what friend a stranger seen on the train resembles or, to revert to an earlier illustration, what a strange noise coming from the attic might mean. What people do under such circumstances is to try out various possible suggestions supplied by their background of relevant experience until they stumble on something that fits the perplexing pattern. The motivation back of such effort is often little more than intellectual curiosity of the kind involved in solving crossword puzzles, watching

a steam shovel operate or reading the headlines of a newspaper

No crucial personality conflicts are revealed by perceptual acts of this sort. Many dreams can be regarded as products of this kind of perceptual effort induced by the ambiguous nature of sensory patterns experienced by the sleeper. More ambiguity occurs in sleeping than in waking because so much of the total perceptual field is cut off. This truncated stimulus pattern is not easily recognizable precisely because it is a distortion of the familiar whole of waking perception. Even recognition of a whiff of cigar smoke may constitute a perceptual puzzle for the sleeper with the sensory setting so different from that of waking experience. There is no visual apprehension of a lighted cigar, no awareness of actual conversation and no familiar feeling of sitting in a chair at the club. Orientation with respect to time and place is also apt to be warped or absent. Instead the smell of smoke may be part of a dim awareness of cramped leg muscles and limp arm muscles plus incipient heartburn. It is this totality of a novel stimulus pattern to which the dreamer responds with the what-can-it be attitude. The consequent dream formation may be regarded as a series of trial percepts—many of them bizarre—brought to bear on what amounts to a bizarre problem. Trial percepts may therefore be viewed as part of the stuff of which dreams are made.

The rest of the stuff the bipartite theory would utilize in accounting for dreams may also be exemplified by means of the ink blot technique. Seeing the blot's contour as a map of Australia merely served as an illustration of the psychological factors involved in the trial percept type of response. However, if a dark smudge on the blot were to remind a subject of black despair or of sudden death or of the dark forces of evil or of conspirators whispering in the night, then a different set of psychological factors would be involved. In such a case the subject would be projecting his own emotional disturbances onto the blot material. Projection of this kind would constitute a species of tension release for him. What he attributes to the blot would be more of a sign of what is going on within him than a description or an explanation of the blot as a visual object. Under the circumstances it should be clear why trial percepts are closer to perceptual reality than are processes of tension-release. The tenuous nexus between provocative stimulus and tension-release may account for the bizarre character of many dreams. It is akin to the incongruity observable in connection with many everyday emotional outbursts in which worried or irritable people give vent to pent up feelings which are touched off by annoyances disproportionately trivial as compared with the magnitude of the resulting emotional upheaval.

In the light of the bipartite theory dreams are products of tension-release and of trial perception. Sometimes one set of factors may be responsible for a given dream, sometimes another set and often both sets of factors may be operating conjointly. These possibilities can be illustrated by the familiar dream of falling through space. In extremely rare instances such a dream is indicative of a semicircular canal disturbance as has been demonstrated by checking on the dreams of patients so afflicted. In a large number of instances, however, such dreams are consequences of passive shifts in the bodily position of the sleeper. This has been shown by means of experimental study of the dreams of hypnotized subjects. A slight deflection of the pillow, just enough to cause the subject's head to slip a fraction of an inch, will suffice to produce a dream of diving with the body twisting in the direction in which the head was made to slip.

The foregoing examples illustrate falling dreams as trial percepts. But such dreams may also be expressions of tension-release. They may conceivably be unconscious outlets for suicidal tendencies or symbolic expressions of fear of failure or the lure of erotic temptation. To illustrate by means of the last possibility let it be assumed that a passive shift of the head of some woman causes her to dream of falling off a precipice and landing in a muddy pool. Subsequent analysis of the dreamer's background, let it be further assumed, reveals a history of persistent struggle with a banal sex conflict. Under the circumstances, in terms of the bipartite theory, one might hazard the guess that the passive bodily shift touched off the trial percept of falling and that the moral conflict determined the emergence of the muddy pool as the terminus of the dream. In verbal terms it would be as if the dreamer had said to herself, "If I yield to this desire, I'll be like a fallen woman and end up in the mire of social disgrace." It should thus be clear that many dreams may be products of both sets of factors stressed by the bipartite theory.

In conclusion, it should be noted that in terms of knowledge of the psychology of dreaming there is no way of telling from direct scrutiny of a given dream whether to regard it as the consequence of a trial percept or whether it was a function of tension-release or whether both sets of factors were involved. To settle questions of this sort the investigator must know more about the inner life of the dreamer than bare knowledge of a single dream can supply. The dream may be a "royal road to the unconscious," as Freud taught, but it continues to be a winding and difficult highway on which the dream analyst must proceed cautiously lest he fail to steer clear of numerous psychological pitfalls. In other words, a smooth, finished highway to and from dreamland still awaits scientific construction.

DREDGES AND DREDGING Dredging is the name given to that branch of excavation which deals with the process of removing materials lying under water and disposing of them according to the requirements of the work in hand. The machines employed to that end are termed dredges (dredgers outside the U.S.) and the term dredging plant covers not only the dredging machines themselves but much auxiliary apparatus employed in connection therewith.

Spurred by the demands for increased facilities for shipping, and assisted by the great advances of mechanical science, dredges developed rapidly from primitive tools to powerful and costly appliances.

Applications of Dredging—Although dredging machinery is, from the nature of its duties, mounted on floating craft in the great majority of instances, the term does not exclude subaqueous excavation by plant mounted on land. Dredging may be divided broadly into two classes according to the object for which it is employed, viz. (1) as a means of removing material for the purpose of increasing existing depths of water or reclaiming low-lying ground, and (2) as a means of mining for making available earths useful in themselves or because they contain precious constituents.

Its field, however, covers a multitude of purposes within the bounds of these two main divisions, and the following uses to which the plant may be put will illustrate the wide scope of dredging operations.

Material Shifting Dredges—The creation and maintenance of satisfactory depths of water in harbours, docks, rivers and canals for the purposes of navigation, the removal of material for the foundations of marine and river works and for the preparation of sites for floating docks, the deepening, widening and straightening of rivers to increase or conserve their discharging capacity, the cutting of drainage and irrigation canals, the removal of material for the reclamation of low lying land or the formation of dykes, levees or dams.

Mining Dredges—The recovery of gold and culm from rivers or placer deposits, also platinum, tin and other heavy metals, the raising of gravel, sand and clay for building and industrial purposes.

Characteristics of Materials Dealt with—Dredges have been constructed to deal, in varying degrees of efficiency, with anything from mud to rock. The materials when removed from the bottom are termed spoil and naturally occur in endless variety of kinds and mixture of kinds. In general, however, the natural basins of alluvial deposits forming the rivers and bays in which harbours and other marine works are mostly sited are the situations peculiar to dredging operations. Sand and mud are the most common materials met in dredging forming the bulk of obstruction to navigation and of accumulations in and about harbours and river channels. Materials other than sand and mud are more difficult to dredge. Clay and loam are classed as loose materials but can scarcely be regarded as "free getting" since they may be somewhat difficult to dislodge from the apparatus when being discharged. Further along the scale of compactness comes a wide and rather indefinite class of mixtures of loam and boulders in various degrees of cementation. They are resistant to penetration and cause difficulty because of size of the boulders. Gravel is often found in dense layers strongly compacted with sand, and this, together with indurated sand, is difficult to dis-

tegrate, but once penetrated, removal is comparatively easy. Conglomerates, consisting of pebbles held together by natural forms of cement, and solid rock require either the application of excessive power in the dredging tool or previous disintegration by percussion or blasting, with subsequent dredging of the debris.

Classification of Dredging Plant.—Dredges fall into two main classifications according to the conditions under which they operate, viz., seagoing vessels and vessels for inland water service. The former are generally shipshape vessels constructed as far as possible in the accepted manner for withstanding sea conditions and ocean voyages, and carrying their own propelling machinery. The latter class is of lighter construction partaking more of the box or pontoon form and generally lacking propelling machinery. Inland dredges are sometimes made portable for over land shipment by bolting together a number of small pontoons and erecting thereon demountable machinery and equipment. There are of course intermediate types and, in general, dredging vessels are constructed more strongly to withstand the working stresses to which they are subject than vessels for commercial purposes. Mining dredges as a class are of the inland type. A further clarification is possible in accordance with the method of disposal. Stationary dredges discharge their spoil into barge, brought along side, or to river banks or shore, either directly or through long shoots or pipes. Hopper dredges receive the spoil into a specially formed hold or hopper in the hull or the dredge and when full proceed to sea or other convenient site to dump their load. The inland dredge class as a whole is of the latter type, but seagoing dredges are of either type according to the particular requirements of the work and situation, and not infrequently hopper dredges include arrangements which make them capable of working on either

system.

Basic Types of Plant.—The basic types of dredging machine are the bucket-ladder dredge, the suction, or hydraulic, dredge, the dipper dredge, the grab dredge and the scraper dredge. In addition, dredging often necessitates the employment of a variety of auxiliary plants, and there are a number of appliances, which, although not falling strictly within the definition of a dredge, in that they do no more than loosen without raising the spoil to the surface, yet serve to carry out in some measure, with the help of moving water, the work of dredging.

The Ladder Dredge.—The main feature of the ladder dredge is a continuous chain of buckets running round a rigid frame called the ladder extending down from the ship to the bottom of the water, as shown in fig 1. The buckets run empty down the underside of the ladder, dig into the material as they turn round the end and return full along the top side of the ladder. On reaching the top, each bucket, as it turns over, discharges its contents into a shoot which conveys the spoil to the vessel's own hopper, to a barge or, in some cases, to the shore. The revolving members at each end of the ladder are called tumblers and the top tumbler drives the bucket chain. The ladder of the typical ladder dredge is hinged at the top to a high structure on the vessel, the height of which is regulated by the requirements of the discharging operation, and extends downward at an angle not exceeding 45° through an open recess or well in the hull, the lower end being supported by rope tackle which serves to adjust it to the dredging depth required or to raise it entirely when it is desired to steam away.

The Suction Dredge.—The suction, or hydraulic, dredge, shown in fig 2, depends on quite different agencies for its opera-

GOLD AND CHANNEL DREDGES AT WORK

- 1 Digging ladder of a large gold dredge. The steel derrick supports the ladder arm around which the bucket chain travels. Shell buckets raise the gold bearing sand of river bed for panning within dredge house. The size of the machine is evident by comparison with the figures at left.
- 2 Gold dredge in Bonanza Creek, Yukon, a forerunner of dredge in fig. 1. Right, bucket chain removing gold bearing sand from creek bed and centre power and separating house. Left, discharge conveyor dumping gravel.
- 3 Orange peel dredge dipping up slag from side of pier. In this form of dredge the hoist controls a bucket divided into triangular sections pointed at base. When lowered the bucket is open until it strikes into bed of material then closed upon the material. The filled bucket is shown being carried over wall of the pier.
- 4 Large dipper dredge at work in the Panama canal. This type of dredge operates like a steam shovel scooping up material from bed of water-way and depositing it in barge at side. A trap door in the bucket scoop is operated by a chain or rope under the movable arm in the swinging hoist.
- 5 Hydraulic pipe line dredge showing arm raised above surface. The spiral dredging head revolves digging silt which is drawn by suction into pipe located within dredging arm. At left edge of picture may be seen the discharge pipe leading from dredge to barge or to land.
- 6 Hydraulic dredge driven by Diesel engine used in shallow water. The dredge is shown removing grass grown bank from river channel. A pipe line may be seen (right) in the rear of the dredge, supported by pontoons reaching the shore.

tion Where the ladder dredge removes and raises the material mechanically, the suction or hydroaulec dredge, as its name implies, relies on suction to lift the material to the surface. The device consists essentially of an airtight suction pipe, one end of which is lowered to the bed of the sea or river, and the other connected with a centrifugal pump. The latter comprises a casing within which an impeller, or fan, is revolved at high speed and by its action expels the contents, whether air or water outward from the centre through an outlet on the periphery or rim of the casing, thereby causing a partial vacuum at the centre, to which the suction pipe is attached. The atmospheric pressure on the water outside proceeds to repair this vacuum by forcing water in through the only available route (viz., the suction pipe) and the water in its mid rush into the pipe agitates and carries with it a proportion of solids. In some situations, means are provided at the suction pipe end, or nozzle, of disintegrating or actually cutting the compact materials to enable them to come under the influence of the so-called suction.

The Dipper Dredge—The dipper and grab dredges are also of the bucket type, but more intermittent in operation than the ladder dredge. The dipper dredge is illustrated diagrammatically in fig. 3. The principal features of the dipper dredge are the bucket and the arm to which it is attached the boom which supports and guides the arm and which is mounted on a turntable so that dredging can be undertaken around a wide arc and the load deposited to either side, the hoisting rope which passes over a sheave at the boom head and gives the required excavating movement to the bucket and the backing rope by means of which the vessel may be turned and moved forward using the bucket resting on the bottom as an anchor. The bucket has a hinged bottom, the catch of which is released by a hand rope to dump the load. To convert the heavy digging reactions the vessel is made to rest on the bottom partly independent of water support on two anchor spuds, and a guide or poling spud is provided at the stern.

The Grab Dredge—The grab dredge employs a slewing crane to operate its bucket, which is in two parts hinged together and controlled by levers and chains or ropes. The bucket is dropped to the bottom in an open condition by means of one rope, digs in partially by virtue of its own weight and completes its bite by means of the strong leverage effected by the other rope on the two halves when the crane begins to hoist. By holding on the hoist, or holding rope, and releasing the closing rope the bucket opens and discharges its contents. Some grabs are specially arranged to operate with one rope only, discharge being effected by means of a tripping device suspended from the jib head.

The Scraper Dredge—The scraper, or the dragline bucket dredge, is a form in which material is handled with a scoop suspended from a swinging boom. The scoop is drawn toward the machine by a line attached to the front and a second line at the rear holding it at the proper angle to slice the earth away as it is moved forward. When the scoop is filled, it is lifted to the point of the boom, both lines being kept taut, and is then swung around, on slackening the drag, or hauling line, the scoop dumps automatically.

Auxiliary Plant and Miscellaneous Appliances—There are two methods of dealing with rock under water. British engineers generally rely on the rock breaker, or cutter, whereas U.S. engineers use the drill boat. The rock breaker consists of

The Mining Dredge—The mining dredge for the recovery of precious metals is generally an adaptation of the ladder dredge. It is often to be found at considerable distances from a river, having cut its way through the land and deposited the spoil behind it in effect carrying with it the pool in which it floats. A typical tin dredge is shown in fig. 4. The earth brought up by the buckets is discharged into a perforated cylindrical revolving screen which disintegrates it and allows the heavier tin laden soil to drop through the perforations into a distributing box, while the huge rough materials pass out of the screen and are discharged over the stern by a belt conveyor. The soil from the distributing box together with an ample supply of water is led by shoots into pans in which it is agitated by mechanically operated rags. This operation allows the heavy tin to sink to the bottom of the pans while the lighter soil runs in suspension in the water and passes overboard through a tail shoot. The metal is collected from the pans at intervals.

Prime Movers—Steam as a mode of power is particularly well adapted to the rough and fluctuating character of the work of dredging. Steam plant has been universally used and is comparatively simple and well understood while its inherent flexibility enables it to accommodate itself conveniently to the constantly varying power requirements and to sustain a heavy pressure on the tool when the latter has been brought to a dead stop by the severity of the work. The internal combustion oil engine has found some application in situations where economy of space and fuel are vital considerations. In general its lower range of flexibility and inferior capabilities of sustained power at low speeds together with the high pressures possible, necessitate the introduction of safeguards, which operate to reduce the economy and convenience to be expected from its higher thermal efficiency and self contained character. The diesel electric drive in which the oil engine operates under favorable conditions as a prime mover for the electric secondary machinery, which drives the various motions, has found many applications in recent years. This drive possesses characteristics more suited to dredging operations than the direct oil engine drive and is found to be economically comparable to steam plant, even with the complication of electrical equipment. The electric drive pure and simple is in use in the tin mining areas,

DIPPER DREDGE AT WORK IN A SLIDE IN CULOBRA CUT DURING THE CONSTRUCTION OF THE PANAMA CANAL.

where many dredges are supplied through cables from a central generating station.

Selection of Dredging Plant—It will be evident that the selection of dredging plant to satisfy the requirements of different localities and different circumstances needs the exercise of sound judgment. The ladder dredge is eminently adapted for dealing up to great depths with all classes of material from mud to the softer varieties of rock, including small boulders, and of preparing a level bottom. Its mechanism tends to make it heavy and cumbersome, with correspondingly heavy capital cost and upkeep charges. It may, however, be regarded as the universal large

pulvers, grappels, rakes and harrows, mechanical stirrers, water jets and other devices for placing the material into suspension so that it may be carried away by river flow or by the ebb tide.

dredging tool and is preferred in a great number of cases where accuracy of work in a wide variety of materials is required and it can be kept fully employed, provided its bulk and widespread moorings are not of grave consequence. The maximum dredging depth in sea works is 70 ft., and this the ladder dredge can tackle. Some of the mining dredges, however, work down to 100 ft. and more. In more restricted situations and for less extensive projects the grab dredge generally proves more economical in first cost and upkeep, and is well suited to maintenance work and work of an intermittent nature or in awkward situations. The dipper dredge is as capable as the ladder dredge of dealing with all classes of materials, and as a tool for really difficult individual tasks at depths up to about 50 ft. has no equal because of the great force which can be exerted with the cutting edge of its bucket and the large capacity, sometimes up to 15 cu yd., of the latter. The grab dredge is not so powerful but can dredge at great depths exceeding any other type and is eminently suitable for pioneer inland work. The suction dredge succeeds when large quantities of soft materials have to be dealt with, provided there is no objection to the large admixture of water. Quantity, not quality, is its leading characteristic, for it effects its object in free flowing materials by excavating large holes in the bottom. The irregularities are subsequently levelled down by sea or river action, thus effecting an increase in the depth of water. In the more compact sands a series of high-pressure water jets around the nozzle serve to break up the material sufficiently, but in clay and similar substances a rotary cutter is required and serves to increase the accuracy of dredging to as great a degree as any dredge can attain. By reason of the large quantity of water, often 90% of the total volume pumped, the suction dredge is relatively inefficient, but the operation is continuous and has the valuable property of enabling, when required, the spoil to be discharged direct through a pipe system to considerable distances without expensive rehandling. The scraper is in efficient form for shallow cuts over large areas. It has a wide reach by the means of a boom and will excavate soft or fairly hard material. The majority of all types of dredges have their excavating member so located in advance of the hull that the vessel can cut its own flotation.

Methods of Dredging.—In the case of the bucket dredge, practically only one general method of dredging is pursued. The vessel is moored by means of six anchors and chain cables set out as shown diagrammatically in fig. 5. The head and stern moorings are much longer than the side moorings, and the vessel swings to or pivots about the head mooring A and is dragged slowly transversely by one pair of side moorings C and D. On reaching the limit of the cut to that side the vessel is advanced about six feet by pulling on the head mooring, the stern line being paid out to correspond, and the vessel is dragged across to the other side of the cut by side moorings E and F, the other side moorings C and D being paid out the while. This operation goes on until the head chain becomes too short and the angles of the side chains tend to become ineffective, when the vessel is pulled back by the stern mooring B to commence a fresh series of cuts at a lower depth or, if the required depth has been reached, dredging is stopped for the time being and the whole of the anchors taken up and relaid in a fresh position. The depth of cut is on the average about 18 in. and the handling of the moorings is effected by steam winches. The excellent control of operations which this method gives permits very accurate dredging. In reality, the dredged area would at first present the appearance of a ploughed field with exaggerated furrows, but sea or current action soon levels out the ridges.

Special Cases.—The excavation of bridge piers, piers and work of a similar type, where the area to be excavated is limited and the depth is great, is usually done by some special form or method (See CAISSON, COFFER-DAM, WELL.)

Influence of Tide and Weather.—In a seaway the whole operation is highly skilled, since the dredging master must adjust the depth of his ladder to the varying tide level so as to keep the work uniform, and it will be appreciated that inclement conditions make it exceedingly difficult to maintain a level bottom. In practice, work is not generally permissible when the swell attains

about two feet in height, because of the structure's being exposed to immense stresses from the ladder's bumping on the bottom. It will be apparent that this system of dredging constitutes a serious obstruction to shipping in a narrow waterway, more especially when barges are employed to remove the spoil, and that the operation of lifting and relaying moorings on a fresh field is a heavy undertaking. A hopper dredge will present less of an obstacle but loses, for dredging, the time occupied in transporting the dredgings to the dumping site and returning to its work. When the hopper is full, the three forward chains are coupled together and let go, and similarly with the three stern moorings, the ends being attached to mark buoys. The operation of picking up these moorings again and connecting them to the winches is also one of considerable moment.

Suction Dredging.—The suction dredge operates generally on the same principles as the bucket dredge, but in some cases the six anchor moorings are dispensed with in favour of two "walking" spuds, placed abreast some distance apart at the stern, together with two forward side, or breast, moorings, consisting of wire ropes and anchors. In operation under this system one spud is let down to the bottom to act as an anchor, and the forward end with suction pipe is swung by one breast mooring to the limit of the cut. Their relative positioning brings the other spud in advance of the pivot spud, the former is let down to act as pivot, the latter raised and the dredge swung on a new advanced arc back to the opposite side of the cut by the other breast mooring. The two spuds thus act as legs and the dredge "walks" forward. The breast mooring lines or cables are usually attached to winches on the dredge and are run through sheaves to the shore anchors. Fig. 6 illustrates this method. Through remote controllers in a central control house the dredge operator can manipulate the mooring lines and the two spuds without outside help.

Bar Dredging.—A particular case in which a different method is employed is the dredging of a navigable channel through a sand bar blocking a river entrance. Here large quantities must be removed under arduous open sea conditions, precluding in most cases the employment of such a rigid structure as a bucket ladder, or in some cases even the use of moorings. The suction dredge is eminently adapted to this work since its suction pipe can be made flexibly jointed, thus relieving the ship of any bumping stresses. In those cases where the sand will not run freely to the suction pipe, the latter must be made somewhat more rigid and is fitted with a drag head or cutting edge. The dredge steams slowly ahead, and the drag head slices off the material to a depth of 18 in. or 2 ft. to bring it under the influence of the suction pipe. This is of course a rough operation since the result is simply the cutting of a series of longitudinal furrows. In such situations the bar is often of sufficient width to permit a full load's being obtained in one cut. The drag method is also employed successfully where the area is large and the depth to be removed small, and it is capable of more accurate work than ordinary suction dredging.

Stationary Dredging.—In the case of the dipper dredge, which relies on spuds, no external moorings are necessary. The dredging machinery being arranged on a turntable, cuts are taken around an arc of about 90° or more while the vessel remains stationary. The anchor spuds are then lifted and the vessel moved up to suit the next series of cuts by means of the backing rope and the stern spud acting after the manner of a punt pole. The anchor spuds are then reset and dredging operations continued. A development of the suction dredge employs a suction pipe mounted on a turntable after the manner of a dipper dredge, and operates on a similar method the hull being kept stationary during the progress of each arc of cut either by moorings or by spuds. The grab dredge is another example of this system of operation, but requires about three or four moorings only to retain and adjust its position at its work, the dredging reactions being purely vertical.

Determination of Work Done.—The work done by dredges is measured either "in the solid" or "in the loose" (termed "measurement in-place" or "scoow measurement" in the U.S.) Measurement in the solid involves the determination by soundings taken before and after dredging of the levels of the excavation. Measurement in the loose is based on a determination of the amount

of spoil actually issuing from the dredge, either from the known capacity of the barges or hopper used or, in the case of pipe line work, by survey of the deposit. Rough and ready methods based on known data are sometimes employed, such as by counting the rate at which the buckets travel on a ladder dredge, the number of dips or grabs per hour or estimation of the velocity of flow and percentage of solids in a pipe line. Spoil, originally lying closely compacted in its natural state on the bottom, has been dug into, stirred up and mixed with water by the action of the dredging tool, hence a swelling, generally taken as 30% in the absence of definite data, is observable in loose, or barge, measurement, as compared with solid, or place, measurement.

Disposal of Spoil.—The disposal of spoil demands close consideration since it has an important effect on the cost of dredging. Where it is desired simply to get rid of the spoil, as in the improvement and upkeep of navigable channels, it is usually requisite to transport it considerable distances out to sea and deposit it in deep water from where there is little likelihood that it will find its way back under the influence of currents or sea action. For this purpose a fleet of barges, either self propelled or towed, may be employed or the dredge itself conveys to sea the spoil which it excavates. In each case the hopper bottom is formed of a number of doors which can be opened to allow the spoil to drop out. The conditions determining the method to be adopted vary almost with every project. Obviously, it is advisable to keep such an expensive item of plant as a dredge fully employed if at all possible, and the use of hopper dredges is resorted to only when at attendant barge traffic is either impracticable because of inclement conditions or likely to cause serious additional obstruction to navigation in a busy and restricted waterway. The hopper type is useful also in the smaller sizes for general maintenance work as a self contained unit. In those cases where the distance to the dumping site does not exceed a mile or two or where the material is required for reclamation purposes, towed barges are used, while for long distances, large speedy self-propelling barges are necessary. For the important work of reclaiming land the suction dredge and a long pipe line are generally employed as long as free getting materials are to be dealt with. The portion of the pipe line from the dredge to the shore is made in sections 30-50 ft long, flexibly connected by ball and socket joints so as to permit the dredge its necessary range of movement. Each section of the pipe is carried on a pontoon and the floating pipe line connects to a shore delivery pipe line laid directly on the ground or mounted on trestles. If harder materials must necessarily be used or the conditions of exposure, or obstruction to navigation preclude the use of a pipe line, it becomes necessary to employ a fleet consisting of a cutter-suction or ladder dredge and a special reclamation vessel with barges as the connecting links. The reclamation vessel is in most respects equipped like a suction dredge except that its suction pipe is arranged over one side so as to dip into a barge, it is moored to a wharf or staging on the other side and its discharge pipe is flexibly connected directly to the shore pipe line. By this means low-lying areas situated up to 6,000 ft from the water front can be reclaimed, and at still further distances by the employment of boosting pumps.

DREISER, THEODORE (1871-1945), U.S. author, was born at Terre Haute, Ind., on Aug. 27, 1871. He attended the public schools at Warsaw, Ind., and for a brief period Indiana university. He then went into newspaper work in Chicago, St. Louis and Pittsburgh. He began writing for various periodicals, engaged in editorial work, and became in 1907 editor-in-chief of the *Butterick* publications in New York city. This post he held until 1910. His first novel *Sister Carrie*, published in 1900, was suppressed, but not before it had aroused the admiration, for its unsparing and poignant realism, of Frank Norris, the noted U.S. realist, and later in England of Arnold Bennett, H. G. Wells and Hugh Walpole. Dreiser's second novel, *Jennie Gerhardt*, did

not, however, follow until 1911. It had been written as a relief from editorial work, and its publication found Dreiser now devoting himself entirely to literature. In 1914 he brought out *The Financier*, the first of two books based upon the career of the traction magnate, Charles T. Yerkes. The second, *The Titan*, followed in 1914. In the year between Dreiser published *A Traveller at Forty*, an autobiographical volume, the fruit of a first trip abroad. *The Genius*, in 1915, was a long and detailed study of the ruthless type of artistic temperament. This was followed by Dreiser's first venture into miniature drama, *Plays of the Natural and Supernatural*, and the same year, 1916 brought forth *A Hoosier Holiday*, based upon a revisiting of his native State. Subsequent volumes included *The Hand of the Potter*, a tragedy (1918), *Twelve Men* (1919), *Hey, Rub-a-Dub-Dub* (1920), *A Book about Myself* (1921), *The Color of a Great City* (1923) and *A Gallery of Women* (1929). The publication in 1925 of *An American Tragedy*, based upon an actual American crime, brought Dreiser his first widespread popular recognition. The novel was dramatized by Patrick Kearney, presented by the Theatre Guild and proved the sensational play of the season.

Theodore Dreiser was in 1929 probably the most important realist writing fiction in the United States, and this, in spite of the fact that he had been called "the most suppressed and unappreciated writer in America," and the more important fact that he could hardly be said to have achieved a style, his writing being often heavy handed and clumsy. His large attempts, his close attention to detail, the cumulative effect he gained by laborious presentation of the exact truth were qualities that would not in themselves account for the stature he attained as a novelist. A greater quality than these is to be found in the deep human sympathy underlying his treatment even of the most sordid and sombre human affairs. It goes hand in hand with a sincerity that never swerved. The manner of Dreiser's writing has been the subject of much criticism from an artistic point of view, but there is general agreement as to the value of his super-representational presentation of some of the most significant aspects of modern American civilization. He built solidly the story, for the most part, of tragic lives, tracing their inevitable course every step of the way and refraining from any comment save that implicit in the lives themselves. He achieved a remarkable detachment in his writing. Dreiser died in Hollywood, Calif., on Dec. 28, 1945.

A brother of Theodore Dreiser was the late Paul Dreiser, the popular song writer. A collection of his best songs appeared with an introduction written by Dreiser. Further biographical and bibliographical material upon this novelist may be found in Burton Rascoe's *Theodore Dreiser* (1925), in Bessie Graham's *The Bookman's Manual* (1924) and in H. L. Mencken's *A Book of Prefaces* (1917). (W. R. BR.)

DRELINCOURT, CHARLES (1595-1669), French Protestant divine, born at Sedan on July 10, 1595, became minister of the Reformed Church at Charenton. His *Catechismus (Catéchisme ou instruction journalière, 1652)* and *Christian's Défense against the Fears of Death (Consolations de l'âme fidèle contre les frayeurs de la mort, 1651)* became well known in England by means of translations, which were very frequently reprinted. It has been said that Defoe wrote his fiction of Mrs. Veal (*A True Relation of the Apparition of Mrs. Veal*), who came from the other world to recommend the perusal of Drelincourt on Death, for the express purpose of promoting the sale of the English translation of the *Consolations*, to the fourth edition of which (1706) his contribution is added. Drelincourt died on Nov. 3, 1669.

DRENTE (or DRENTHE), a province of Holland, bounded north and northeast by Groningen, southeast by Germany, south and southwest by Overijssel, and northwest by Friesland, area, 1,028 sq. mi., pop. (1946) 269,769. Drente is a sandy plateau forming the nucleus of the surrounding provinces. The sandy soil is covered with bleak moorland, patches of wood, and fen. This is only varied by the strip of fertile clay and grass-land which is found along the river banks, and by the areas of high fen in the southeastern corner and on the western borders near Assen. The surface slopes from southwest to northeast,

where it ends in the ridge the Hondsrug (Dog's Back) along the eastern border. The watershed runs from east to west, along the line of the Orange canal. The southern streams are all collected at two points on the southern borders, namely, at Meppel and Koevorden, whence they communicate with the Zwart Water and the Vecht respectively by means of the Meppeler Diep and the Koevorden canal. The Steenwyker Aa, however, enters the Zuider Zee independently. The northern rivers all flow into Groningen.

History—The megalithic sepulchral mounds, the *Hunebedden*, particularly along the western edge of the Hondsrug suggest the early settlement of the region. In the 5th and 6th centuries the country was overrun by Saxon tribes, and later on was governed by counts under the Frankish and German kings. In 1046 the emperor Henry III gave the countship to the bishop and chapter of Utrecht, who governed it through the burgrave, or châtelaïn, of Koevorden, a dignity which became hereditary after 1143 in the family of Ludolf or Roelof, brother of Heribert of Bierum, bishop of Utrecht (1138-1150). After 1232 the countship passed to Henry I of Borculo (1232-1261). In 1395 Reinold IV (d. 1410) of Borculo Koevorden was deposed by Bishop I. red. enck of Utrecht, and the country was henceforth administered by an episcopal official (*amtmann*). With its popularly elected assembly of twenty-four *Etten* (*jurats*) Drente remained practically independent. In 1522 it was conquered by Duke Charles of Gelderland, from whom it was taken by the emperor Charles V in 1536, and from that time it became part of the Habsburg dominions.

Drente took part in the revolt of the Netherlands, but owing to its poverty and sparse population, it had no separate representation in the assembly of the states general. It was subdued by the Spaniards in 1530, but reconquered by Maurice of Nassau in 1594. Drente retained its local independence and had its own stadtholder. At the general assembly of 1651 Drente unsuccessfully claimed admission as a province. After the deaths of William II (1650) and of William III (1702) Drente remained for a time without a stadtholder, but in 1722 William Charles Henry, who had become prince of Orange, was elected. His descendants held the office, which was declared hereditary, until the French conquest in 1795. In 1796 Drente at length obtained representation in the states general. Between 1806 and 1813 Drente, with the rest of the Netherlands, was incorporated in the French empire, and, with part of Groningen, formed the department of Ems Occidental. With the accession of William I it was restored as a province of the new kingdom. The province was speedily conquered by Germans in invasion of May 1940.

Two industries have for centuries been associated with the barren heaths and sodden fens so usually found together on the sand grounds, namely, the cultivation of buckwheat and peat-digging. The latter being directed also towards the draining of the land and its subsequent use for cultivation. The soil thus prepared is, however, soon exhausted. Potatoes, rye, oats, beans and peas are cultivated. In connection with the cultivation of potatoes, the by-products (spirits, potato meal, etc.), are important. Furthermore, agriculture is accompanied on the sand-grounds by the rearing of a poor type of sheep and cattle, which assist in fertilizing the soil. The breeding of pigs is also widely practised. Of the fen-colonies in Drente the best known are those of Frederiksoord and Veenhuizen.

Owing to the general condition of poverty which prevailed after the French evacuation early in the 19th century, attention was turned to the unclaimed heath-lands in the eastern provinces, and the Society of Charity began by establishing the free agricultural colony of Frederiksoord, about 10 m N of Meppel. In addition, various industries, such as mat and rope making, and jute and cotton weaving were introduced. In later times forest culture was added, and the Gerard Adriaan van Swieten schools of forestry, agriculture and horticulture were established. To this colony were added those of Willemsoord and Klonne VII in Overysel, and Wilhelmsoord partly in Friesland. The colony of Veenhuizen lies about 7 m NW of Assen, and was founded by the same society in 1823. In 1859, the Veenhuizen estates

were sold to the government.

Owing to its geographical isolation, the development of Drente has remained behind that of the other provinces of the Netherlands, and the character and customs of the people likewise conservative. Assen is the chief town. In the south are Meppel and Koevorden. Hoogeveen, situated between these two, owes its origin to the fen reclamation which was begun here in 1625. Extensive fir woods have been laid out in the neighbourhood Zuidlaren, at the northern end of the Hondsrug, has an important market. The railway from Amsterdam to Groningen traverses Drente, branch lines connect Meppel with Leeuwarden and Assen with Delfzijl.

DRESDEN, a city of Germany, capital of the *Land* of Saxony, 71 mi ESE from Leipzig and 111 mi S from Berlin by railway. Pop. (1939) 625,174, mainly Lutheran. It lies 402 ft above the Baltic, in a broad valley on both banks of the Elbe. The prospect of cupolas, towers, spires and copper green roofs is of striking beauty. On the left bank of the river are the Altstadt (old town) with old and new suburbs, and the Friedrichstadt (separated from the Altstadt by a long railway viaduct), on the right, the Neustadt (new town), Antonstadt, and Albertstadt. Five fine bridges connect the Altstadt and Neustadt. The beautiful central bridge—the Alte or Augustusbrücke—with 16 arches, built in 1717-1731, and 1,420 ft long, has been demolished (1906) and replaced by a wider structure. Up stream are the two modern Albert and Königin Carola bridges, and, down stream, the Marien and the Eisenbahn (railway) bridges.

History—Dresden (Old Slav *Dregga*, forest, *Dregagan*, forest-dwellers), which is known to have existed in 1206, is of Slavonic origin, and was originally founded on the right bank of the Elbe, on the site of the present Neustadt, which is thus actually the *old* town. It became the capital of Henry the Illustrious, margrave of Meissen, in 1270, but belonged for some time after his death, first to Wenceslaus of Bohemia, and next to the margrave of Brandenburg. Early in the 14th century it was restored to the margrave of Meissen. On the division of Saxony in 1485 it fell to the Albertine line, which has since held it. Having been burned almost to the ground in 1491, it was rebuilt, and in the 16th century the fortifications were begun and gradually extended. John George II, in the 17th century, formed the Grosser Garten, and otherwise greatly improved the town, in the first half of the 18th century, Augustus I and Augustus II, kings of Poland as well as electors of Saxony, modernized Dresden. The Neustadt, which had been burned down in the 17th century, was founded anew by Augustus I, he also founded Friedrichstadt. The town was bombarded in 1760 during the Seven Years' War. Napoleon made it a centre of operations in 1813, and one buttress and two arches of the old bridge were blown up. The dismantling of the fortifications, begun by the French in 1810, was completed after 1817, and gardens and promenades made. Many buildings were completed or founded by King Anthony, from whom Antonstadt derives its name. Dresden again suffered severely during the revolution of 1849, but all traces of the disturbances which then took place were soon effaced. In 1866 it was occupied by the Prussians, who did not finally evacuate it until the spring of the following year. There was a good deal of fighting in the streets during the year of 1919.

Situation and Buildings—Dresden is often called "German Florence," because of its situation, its art treasures and the educational advantages it offers. Within two decades (1880-1900) the capital almost at a single bound advanced into the front rank of German commercial and industrial towns, but while gaining in prosperity it lost much of its mediaeval aspect, and old buildings in the heart of the Altstadt were swept away. The Theaterplatz in the Altstadt is especially fine.

The most imposing churches include the Roman Catholic Hofkirche, built (1739-1751) by C. Chausen, in rococo style, with a tower 300 ft high. It contains a fine organ and pictures, the outside being adorned with 59 statues. On the Neumarkt is the Frauenkirche, with stone cupola rising 311 ft., close to the Altmarkt, the Kreuzkirche, rebuilt after destruction by fire in 1897, also with a lofty tower surmounted by a cupola, and near the

- 2 The centre of Dresden showing the Elbe River and three of its bridges
The Zwinger, one of the most famous art galleries and museums in

the world with its enclosed court is in the right foreground. The opera house is to the left. Across the open Theaterplatz is the former court church, and across the narrow street from this the former royal palace.

Postplatz the Sophienkirche, with twin spires. In the Neustadt is the Dreikönigskirche (dating from the 18th century) with a high pinnacled tower.

The former royal palace in the Altstadt built in 1530-1535 by Duke George (and thus called Georgenschloss), was thoroughly restored between 1890 and 1902, in German Renaissance style. The Georgentor has been widened, and through it, and beneath the royal apartments, vehicular traffic from the centre of the town is directed to the Augustusbrücke. The whole is surmounted by a lofty tower—387 ft—the highest in Dresden. The interior is splendidly decorated. In the palace chapel are pictures by Rembrandt, Nicolas Poussin, Guido Reni and Annibale Caracci. The adjoining Prinzen Palais on the Taschenberg, built in 1715, has a fine chapel, in which are various works of S. Torrelli, it has also a library of 20,000 volumes. The Zwinger, begun in 1711 in the rococo style was intended to be the vestibule to a palace, but now contains a number of collections of great value. Until 1846 it was open at the north side, but this space has since been occupied by the museum, a building in Renaissance style, the exterior of which is adorned by statues of Michelangelo, Raphael, Giotto, Dante, Goethe and other artists and poets by Rietschel and Hahnel, and it contains the famous picture gallery. The Brühl palace, built in 1737 by Count Brühl, minister of Augustus II, has been in some measure demolished to make room for the new Standehaus (diet house), with its main façade facing the Hofkirche, before the main entrance there is an equestrian statue (1906) of King Albert. Close by is the Brühl Terrace, approached by a fine flight of steps, on which are groups, by Schilling, representing Morning, Evening, Day and Night. The terrace commands a view of the Elbe and the distant heights of Loschwitz and the Weisser Hirsch, but the prospect has become somewhat marred, owing to the extension of the town up the river and to the two new up stream bridges. The Japanese palace in the Neustadt, built in 1715 as a summer residence for Augustus II, receives its name from certain oriental figures with which it is decorated, it is sometimes called the Augusteum and contains the library. Among other buildings of note is the Hoftheater, in the Renaissance style, built after the designs of Semper, to replace the theatre burnt in 1869, and completed in 1878. A new town hall of huge dimensions, also in German Renaissance, with an octagon tower 400 ft in height, stands on the former southern ramparts of the inner town, close to the Kreuzkirche.

In the Altstadt the most striking of the newer edifices is the Kunstakademie. The Albertinum, which was formerly the arsenal, originally built in 1559-1563, was rebuilt 1884-1889, and fitted up as a museum of oriental and classical antiquities, and as the depository of the state archives. On the right bank of the Elbe in Neustadt stand many administrative buildings. In the suburbs which encircle the old town are to be noted the vast central Hauptbahnhof (1893-1898) occupying the site of the old Bohmischer railway station, the municipal hospital and the exhibition buildings.

The chief pleasure-ground of Dresden is the Grosse Garten, in which there are a summer theatre, the Reitschell museum and a château containing a museum of antiquities, chiefly objects removed from the churches in consequence of the Reformation. Near the château is the zoological garden, formed in 1860. A little south of Dresden, on the left bank of the Elbe, is the village Racknitz, in which is Moreau's monument, erected on the spot where he was mortally wounded in 1813. The mountains of Saxon Switzerland are seen from this neighbourhood, and are much visited in summer.

Art—Dresden owes part of its fame to its splendid picture gallery, founded by Augustus I and increased by his successors at great cost. It is in the museum, and contains about 2,500 pictures, being especially rich in specimens of the Italian, Dutch and Flemish schools. The gem of the collection is Raphael's "Madonna di San Sisto," for which a room is set apart. There is also a special room for the "Madonna" of the younger Holbein. Other paintings with which the name of the gallery is generally associated are Correggio's "La Natta" and "Mary Magdalene," Titian's "Tribute Money" and "Venus," "The Adoration" by Paul Veronese, Andrea del Sarto's "Abraham's Sacrifice," Rem-

brandt's "Portrait of Himself with his Wife sitting on his Knee," "The Judgment of Paris" and "The Boar Hunt," by Rubens, Van Dyck's "Charles I, his Queen and their Children."

Of modern painters, this magnificent collection contains masterpieces by Tefregger, Vautier, Mikart, Munkácsy, Fritz von Uhde, Bocklin, Hans Thoma, portraits by Leon Polle, Delarocche and Sargent, landscapes by Andreas and Oswald Achenbach and allegorical works by Sascha Schneider. In separate compartments there are a number of crayon portraits, most of them by Rosalba Carriera, and views of Dresden by Canaletto and other artists. Besides the picture gallery the museum includes a magnificent collection of engravings and drawings, arranged so as to mark the great epochs in the history of art. A collection of casts, likewise in the museum, is designed to display the progress of plastic art from the time of the Egyptians and Assyrians to modern ages. This collection was begun by Raphael Mengs, who secured casts of the most valuable antiques in Italy, some of which no longer exist.

The Japanese palace contains a large public library with about 3,000 mss and 20,000 maps. It is especially rich in the ancient classics, and in works bearing on literary history and the history of Germany, Poland and France. There are also a valuable cabinet of coins and a collection of ancient works of art. A collection of porcelain in the "Museum Johanneum" (which once contained the picture gallery) is made up of specimens of Chinese, Japanese, East Indian, Sévres and Meissen manufacture, carefully arranged in chronological order. There is in the same building an excellent historical museum. In the Grunes Gewölbe (Green Vault) of the Royal Palace, so called from the character of its original decorations, there is an unequalled collection of precious stones, pearls and works of art in gold, silver, amber and ivory. The objects, which are about 3,000 in number, are arranged in eight rooms. They include the regalia of Augustus II as king of Poland, the electoral sword of Saxony, a group by Dinglinger, in gold and enamel, representing the court of the grand mogul Aurangzeb, and consisting of 132 figures upon a plate of silver 4 ft 4 in square, the largest onyx known, 6½ in by 2½ in, a pearl representing the dwarf of Charles II of Spain, and a green brilliant weighing 40 carats. The royal palace also has a gallery of arms consisting of more than 2,000 weapons of artistic or historical value. In the Zwinger are the zoological and mineralogical museums and a collection of instruments used in mathematical and physical science. The Kerner museum contains numerous reminiscences of the Goethe-Schiller epoch, and of the wars of liberation (1813-15).

Education—Dresden is the seat of a number of well known scientific associations. The educational institutions are numerous, including a technical high school (with about 1,100 students), which enjoys the privilege of conferring the degrees of doctor of engineering, doctor of technical sciences, etc., a veterinary college, a political economic institution (Gehestitung), with library, a school of architects, a royal and four municipal gymnasia, numerous lower grade and popular schools, the royal conservatorium for music and drama, and a celebrated academy of painting.

Music—The orchestra attached to the Hoftheater, founded by Augustus II, became famous throughout the world, owing to its masters, Paer, Weber, Reissiger and Wagner. Symphony and popular concerts are held throughout the year in various public halls, and, during the winter, concerts of church music are frequently given in the churches.

Communications and Industries—Dresden lies at the centre of an extensive railway system, which places it in communication with the chief cities of northern and central Germany as well as with the southeast. Here cross the grand trunk lines Berlin-Vienna, Chemnitz-Gorlitz-Breslau. It is connected by two lines of railway with Leipzig and by local lines with neighbouring smaller towns. The navigation on the Elbe has largely developed, and, in addition to trade by river with Bohemia and Magdeburg-Hamburg, there is a considerable pleasure boat traffic during the summer months. Among the more notable industries of Dresden may be mentioned the manufacture of china, of gold and silver ornaments, cigarettes, chocolate, coloured postcards, per-

fumery, leather, lace, soap, straw plating, artificial flowers, agricultural machinery, paper, musical, photographic and other instruments. There are several distilleries and breweries, corn trade is carried on, and an extensive business is done in books and objects of art.

BATTLE OF DRESDEN

The battle of Dresden, the last of the great victories of Napoleon, was fought on Aug. 26 and 27, 1813. The intervention of Austria in the War of Liberation and the consequent advance of the Allies under the Austrian field marshal Prince Schwarzenberg from Prague upon Dresden, recalled Napoleon from Silesia, where he was engaged against the Prussians and Russians under Blücher. Only by a narrow margin of time, indeed, was he able to bring back sufficient troops for the first day's battle. He detached a column under Vandamme to the mountains to interpose between Schwarzenberg and Prague (see NAPOLEONIC CAMPAIGNS), the rest of the army pressed on by forced marches for Dresden around which a position for the whole army had been chosen and fortified, though at the moment this was held by less than 20,000 men under Gouvion St. Cyr, who retired thither from the moun-

tains, leaving a garrison in Königstein, and had repeatedly sent reports to the emperor as to the allied masses gathering to the southward. The battle of the first day began late in the afternoon, for Schwarzenberg waited as long as possible for the corps of Klenau, which formed his extreme left wing on the Freiberg road. At last, about 6 p.m., he decided to wait no longer, and six heavy columns of attack advanced against the suburb defended by St. Cyr and now also by the leading troops of the main army. Three hundred guns covered the assault, and Dresden was set on fire in places by the cannonade, while the French columns marched

uncensuredly over the bridges and through the Altstadt. On the right the Russians under Wittgenstein advanced from Striesen, the Prussians under Kleist through the Grosse Garten, whilst Prussians under Prince Augustus and Austrians under Colloredo moved upon the Moczinski redoubt, which was the scene of the most desperate fighting, and was repeatedly taken and retaken. The attack to the westward was carried out by the other Austrian corps, Klenau, however, was still far distant. In the end, the French defences remained unshaken. Ney led a counter attack against the Allies' left, the Moczinski redoubt was definitely recaptured from Colloredo, and the Prussians were driven out of the Grosse Garten. The coup of the Allies had failed, for every hour saw the arrival of fresh forces on the side of Napoleon and at length the Austrian leader drew off his men to the heights again. He was prepared to fight another battle on the morrow—indeed he could scarcely have avoided it had he wished to do so, for behind him lay the mountain defiles, towards which Vandamme was marching with all speed.

Napoleon's plan for the 27th was, as usual, simple in its outline. As at Friedland, a ravine separated a part of the hostile line of battle from the rest. The villages west of the Plauen ravine, and even Lobda were occupied in the early morning by Gen. Metzko with the leading division of Klenau's corps from Freiberg, and upon Metzko Napoleon intended first to throw the weight of his attack, giving to Victor's infantry and the cavalry of Murat the task of overwhelming the isolated Austrians. The centre, aided by the defences of the Dresden suburbs, could hold its own, as the events of the 26th had shown, the left, now under Ney, with whom served Kellermann's cavalry and the Young Guard, was to attack Wittgenstein's Russians on the Pillnitz road. Thus, for once, Napoleon decided to attack both flanks of the enemy. His motives in so doing have been much discussed by the critics, Vandamme's movements, it may be suggested, contributed to the French emperor's plan, which if carried out would open the Pillnitz road. Still, the left attack may have had a purely tactical object, for in that quarter was the main body of the Prussians and Russians, and Napoleon's method was always to concentrate the fury of the attack on the heaviest masses of the enemy, i.e., the best target for his own artillery. A very heavy rainstorm during the night seriously affected the movements of troops on the following day, but all to Napoleon's advantage, for his more mobile artillery, reinforced by every horse available in and about Dresden, was still able to move where the Allied guns sank in mud. Further, if the cavalry had to walk, or at most trot, through the fields the opposing infantry was almost always unable to fire their muskets. "You cannot fire, surrender," said Murat to an Austrian battalion in the battle. "Never," they replied, "you cannot charge us." On the appearance of Murat's horse artillery, however, they had to surrender at once. Under such conditions, Metzko, unsupported either by Klenau or the main army beyond the ravine, was an easy victim. Victor from Lobda drove in the advanced posts and assaulted the line of villages Wolfnitz-Toltschen, Metzko had to retire to the higher ground south-west of the first line, and Murat, with an overwhelming cavalry force from Cotta and Burgstadt, outflanked his left, broke up whole battalions, and finally, in conjunction with the renewed frontal attack of Victor's infantry, annihilated the division. The Austrian corps of Gyulai arrived too late to save it.

Meanwhile Ney on the other flank, with his left on the Pillnitz road and his right on the Grosse Garten, had opened his attack. The Russians offered a strenuous resistance, defending Seidnitz, Gross Dohnitz and Reick with their usual steadiness, and Ney was so far advanced that several generals at the Allied headquarters suggested a counter attack of the centre by way of Strahlen, so as to cut off the French left from Dresden. This plan was adopted, but, owing to various misunderstandings, failed of execution. Thus the Allied centre remained inactive all day, cannonaded by the Dresden redoubts. One incident only, but that of great importance, took place here. The czar, the king of Prussia, Schwarzenberg and a very large headquarters staff watched the fighting from a hill near Racknitz and offered an easy mark to the French guns. In default of formed bodies to fire at, the latter had for a moment

ceased fire, Napoleon, riding by, half carelessly told them to be open, and one of their first shots, directed at 2,000 yards range against the mass of officers on the sky line, mortally wounded Gen Moreau, who was standing by the emperor Alexander. A council of war followed. The tsar was for continuing the fight, Schwarzenberg, however, knowing the exhaustion of his troops decided to retreat. As at Bautzen, the French cavalry was unable to make any effective pursuit.

DRESDNER BANK The *Dresdner Bank* was established in Dresden, Germany, in 1872 by a syndicate headed by Eugene Gutmann. It became Germany's second largest commercial bank as the result of a long concentration process, which reached its peak during the banking crisis of 1931-32, when the bank was reorganized and absorbed the *Darmstädter und National Bank*. After the 1932 reorganization, the bank had a capital of RM 150,000,000, most of which was held by the German government. Even though the stock was transferred to private investors in 1931, the *Dresdner Bank* continued to be very closely bound to the National Socialist government.

The assets of the bank increased from RM 2,800,000,000 in 1938 to RM 6,700,000,000 in 1943. More than three fourths of this increase consisted of government securities, which accounted for 53% of total assets in 1943.

The head office of the bank was established in Berlin in 1881. In 1941 the bank had 194 branches and 174 agencies, 32 of the latter were located in Berlin. Particularly before and during World War II, the bank developed an extensive foreign system with branches in a great many countries, including Turkey, Egypt, Czechoslovakia, Poland and Rumania; in addition, it obtained controlling interests in many foreign banks.

The bank had close relations with numerous industrial enterprises. Important firms such as Friedrich Krupp A. G., Robert Bosch G. m. b. H., Rheinmetall-Borsig A. G. and Norddeutscher Lloyd were represented on its board of directors.

The head office of the bank in Berlin was closed in 1945, and its branches in eastern Germany liquidated. In western Germany, its branches were temporarily reorganized into ten independent banks in each province, with new and different names for each; in 1952 they were consolidated into three independent banks, each covering a different section of the country, and interlocking directorates were forbidden. The *Dresdner Bank*, as such, no longer exists. (H. A. A.)

DRESS (from the Fr. *dresser*, to set out, arrange, formed from Lat. *directus*, arranged, *dirigere*, to direct, arrange), a substantive of which the most usual meaning is that of clothing or costume in general, or, specifically, the principal outer garment worn by a woman. The verb "to dress" has various applications which can be deduced from its original meaning. It is thus used not only of the putting on of clothing, but of the preparing and finishing of leather, the preparation of food for eating, the application of cleansing and healing substances or of bandages, to wound, the drawing up in a correct line of a body of troops, and, generally, adorning or decking out, as of a ship with flags. In the language of the theatre the "dresser" is the person who looks after the actor's wardrobe and assists him in the changing of his costumes.

INTRODUCTION

The subject of dress in its currently accepted meaning of clothing is of far wider application than appears at first sight. To the average man there is a distinction between clothing and ornament, the first being regarded as that covering which satisfies the claims of modesty, the second as those appendages which satisfy the aesthetic sense. This distinction, however, does not exist for science, and indeed the first definition involves a fallacy of which it will be as well to dispose forthwith.

Modesty is not innate in man, and its conventional nature is easily seen from a consideration of the different ideas held by different races on this subject. With Mohammedan peoples it is sufficient for a woman to cover her face, the Chinese women would think it extremely indecent to show their artificially compressed feet, and it is even improper to mention them to a

woman in Sumatra and Celebes the wild tribes consider the exposure of the knee immodest, in central Asia the finger tips, and in Samoa the navel are similarly regarded. In Thibet and Tonga clothing might be discarded without offence, provided the individual were tattooed, and among the Caribs a woman might leave the hut without her girdle but not unpainted. Similarly, in Alaska women felt great shame when seen without the plugs they carried in their lips. Europeans are considered indecent in many ways by other races, and a remark of Peshvar is to the point: "Were a pious Mussulman of Pershah to be present at our balls and see the bare shoulders of our wives and daughters, and the semi-embraces of our round dances, he would silently wonder at the long suffering of Allah who had not long ago poured fire and brimstone on this sinful and shameless generation." Another point of interest lies in the difference of outlook with which nudity is regarded by the English and Japanese. Among the latter it has been common for the sexes to take baths together without clothing, while in England mixed bathing even in full costume, is even now by no means universal. Yet in England the representation of the nude in art meets with no reproach, though considered improper by the Japanese. Even more striking is the fact that in civilized countries what is permitted at certain times is forbidden at others, a woman will expose her face for her person at night, in the ball room or theatre, but would be considered acutely by day in the street, and a bathing costume which would be thought modest on the beach would meet with reprobation in a town.

Modesty therefore is highly conventional, and to discover its origin the most primitive tribes must be observed. Among these, in Africa, South America, Australia and so forth, where clothing is at a minimum, the men are always more elaborately ornamented than the women. At the same time it is noticeable that no cases of spermotherhood are found, celibacy, rare as it is, is confined to the male sex. It is reasonable, therefore, to conclude that ornament is a stimulus to sexual selection, and this conclusion is enforced by the fact that among many comparatively nude peoples clothing is assumed at certain dances which have as their confessed object the excitation of the passions of the opposite sex. Many forms of clothing, moreover, seem to call attention to those parts of the body of which, under the conditions of Western civilization at the present day, it rims at the concealment, certain articles of dress worn by the New Hebrideans, the Zulu Xosa tribes, certain tribes of Brazil and others, are cases in point. Clothing, moreover—and this is true also of the present day—almost always tends to accentuate rather than to conceal the difference between the sexes. Looking at the question then from the point of view of sexual selection it would seem that a stage in the progress of human society is marked by the discovery that concealment affords a greater stimulus than revelation, that the fact is true is obvious,—even to modern eyes a figure partially clad appears far more indecent than a nude. That the stimulus is real is seen in the fact that among nude races flagrant immorality is far less common than among the more clothed, the contrast between the Polynesians and Melanesians, living as neighbours under similar conditions, is striking evidence on this point. Later, when the novelty of clothing has spent its force, the stimulus is supplied by nudity complete or partial.

One more point must be considered: there is the evidence of competent observers to show that members of a tribe accustomed to nudity, when made to assume clothing for the first time, exhibit as much confusion as would a European compelled to strip in public. This fact, considered together with what has been said above, compels the conclusion that modesty is a feeling merely of acute self-consciousness due to appearing unusual, and is the result of clothing rather than the cause. In the words of Westermarck "The facts appear to prove that the feeling of shame, far from being the cause of man's covering his body, is, on the contrary, a result of this custom, and that the covering, if not used as a protection from the climate, owes its origin, at least in a great many cases, to the desire of men and women to make themselves mutually attractive."

PRIMITIVE DRESS

Primitive adornment in its earliest stages may be divided into

three classes, first the moulding of the body itself to certain local standards of beauty. In this category may be placed head deformation, which reached its extreme development among the Indians of North West America and the ancient Peruvians, foot constriction as practised by the Chinese, tooth chipping among many African tribes, and wrist compression common in Europe at the present day. Many forms of deformation, it may be remarked in passing, emphasise some natural physical characteristic of the people who produce them. Secondly, the application of extraneous matter to the body, as painting and tattooing, and the raising of ornament into scars often by the introduction of foreign matter into flesh wounds (this practice belongs partly to the first category also). Thirdly, the suspension of foreign bodies from, or their attachment to, convenient portions of the body. This category, by far the largest, includes ear, nose and lip ornaments, head dresses, necklets, armlets, wristlets, leglets, anklets, finger- and toe rings and girdles. The last is important, as it is from the waist-ornament chiefly that what is commonly considered clothing at the present day has been developed.

Setting aside for the moment the less important, historically, of these, nearly all of which exist in Western civilization of the present day, it will be as well to consider that form of dress which is marked by the greatest evolution. It is generally supposed that man originated in tropical or subtropical latitudes, and spread gradually towards the poles. Naturally, as the temperature became lower, a new function was gradually acquired by his clothing, that of protecting the body of the wearer. Climate then is one of the forces which play an important part in the evolution of dress, at the same time care must be taken not to attribute too much influence to it. It must be remembered that the Arabs, who inhabit an extremely hot country, are very fully clothed, while the Fuegians at the extremity of Cape Horn, exposed to all the rigours of an antarctic climate, have, as sole protection, a skin attached to the body by cords.

Dr C. H. Strutz divides clothing climatically into two classes: tropical, which is based on the girdle (or, when the attachment is fastened round the neck, the cloak), and the arctic, based on the trouser. This classification is ingenious and convenient as far as it goes, but it seems probable that the trouser, which also has as the waist as its point of attachment, may itself be a further development of the girdle. Certainly, however, in historical times the division holds good, and it is worthy of remark that one of the points about the northern barbarians which struck the ancient Greeks and Romans most forcibly was the fact that they wore trousers. Amongst the most northerly races the latter garb is worn by both sexes alike, farther south by the men, the women retaining the tropical form, farther south still the latter reigns supreme. No distinct latitude can be assigned as a boundary between the two forms, from the simple fact that where migration in comparatively recent times has taken place a natural conservatism has prevented the more familiar garb from being discarded, at the same time the two forms can often be seen within the limits of the same country, as, for instance, in China, where the women of Shanghai commonly wear trousers, those of Hong-Kong skirts. The retention by women in Europe of the tropical garb can be explained by the fact that her sphere has been mainly confined to the house, and her life has been less active than that of man, consequently the adoption of the arctic dress has been in her case less necessary. But it is noticeable that where women engage in occupations of a more than usually strenuous nature, they frequently don male costume while at their work, as, for instance, women who work in mines (Belgium) and who tend cattle (Switzerland, Tirol). The retention of the tropical pattern by the Highlanders is due directly to environment, since the kilt is better suited than trousers for walking over wet heather.

Another factor besides climate which has exerted a powerful influence on dress—more perhaps on what is commonly regarded as "jewellery" as distinct from "clothing"—is superstition. Doubtless many of the smaller objects with which primitive man adorned himself, especially trophies from the animal world, were supposed to exert some beneficial or protective influence on the wearer, or to produce in him the distinguishing characteristics

attributed to the object, or to the whole of which the object was a part. Such objects might be imitated in other materials and by successive copying lose their identity, or their first meaning might be otherwise forgotten, and they would ultimately exercise a purely decorative function. Though this factor may be responsible for much, or even the greater part, of primitive "jewellery," yet it does not seem likely that it is the cause of all forms of ornament: much must be attributed to the desire to satisfy an innate aesthetic sense, which is seen in children and of which some glimmerings appear among the lower animals also.

BABYLONIAN AND ASSYRIAN COSTUME

c. 3000–2000 B.C.—In Sumerian days (3000–2000 B.C.) Babylonian men wore a fringed garment of wool, known to us generally by the name of the *kamakes* (a graecized form of the classical period): the wool seems to have been unspun, and probably the garment consisted merely of natural locks without the hide. It has been conjectured that *kamakes* of feathers were also worn. One shoulder was generally covered by this garment, the other left bare, but a long and heavy cloak, open in front, was often worn. The feet were bare. Men and women both wore their hair equally long. Men dressed it in a *catogan* or chignon at the back, often with the addition of two plaited tails crossed at the back beneath the chignon and with their ends fastened over the forehead. Women had rather more elaborate chignons, sometimes three, one at the back and two at the sides. Priests had their heads shaven and performed certain rites stark naked, as also did the kings and great men, who on these occasions wore their hair down their backs. Beards were occasionally worn. Large hats with brims indicated a mark of dignity, and were worn by gods and kings. Gods had them adorned with horns. Later on we find the kings and important personages wearing a turban consisting of a round cap with a thick band around it. A tunic, sometimes sleeved, and long robes also came in. Warriors wore conical copper helmets like the mediaeval bassinet, and carried shields and spears, a king could wear a gold helmet made in imitation of his own headress (tomb at Ur) and use golden swords and javelins. Copper breast-plates may also have been used. Feet were generally bare, but in later days in Assyria sandals and elaborate high boots were worn. A cylinder-seal of stone was carried, fastened to a great pin with lapis lazuli and round gold head, and used to fasten the garment. It was also used as a stiletto, if needed. Large-knobbed walking sticks were always carried. Herodotus correctly describes the seal and stick carried by every Babylonian. Diggers had often gold and lapis hilts, sometimes even gold blades in early times. In later days the well-known Assyrian "Tiara" with its spike was worn by the kings, the bull horn headress was given to gods. The heavily ornamented robes of the Assyrian period are well known, the enormous earrings and necklaces, the elaborately curled hair and beards of the Assyrian have been familiar to us since the days of Lytton. The war-gear of the later period shows, of course, the development from copper to bronze and then to iron weapons: the helmet taking the characteristic Assyrian peaked form, and in the 7th century it is crowned with the Graeco Carian crest adopted from the West. Great round shields were carried and hauberks worn of metal plates or scales sewn on leather.

We have so few representations of Babylonian or Assyrian women, other than goddesses (who wear long flounced robes) that it is almost impossible to say much of their costume. In the early period one sees them wearing a modification of the men's *kamakes*, with hair rather more elaborately dressed than the men's (see above) and ornamented with nodding balls or flowers of gold and lapis on a comb-like ornament that was stuck into the *catogan* with a sharp ended shank. Later on they wore a shapeless robe, with the hair usually "down." Assyrian women wore earrings of great length and weight like the men's, and other ornaments like theirs. The Ur excavations have shown that the Sumerian women of 2,000 years before already used "vanity-cases" of gold, with tweezers, earpick and head-scratcher complete.

ENGLISH DRESS, 16TH TO 18TH CENTURY

- 1 Coat and trunk (1681) made for Sir Thomas (ham's wedding but never worn. The drab coloured silk brocade is woven in silver gilt thread and cream coloured silk.
- 2 Lady's dress and petticoat (early 18th century) of coffee-coloured silk embroidered with coloured silks.
- 3 Back of lady's dress Elizabethan (1558-1603). The silk brocade is woven in colours on a cream coloured ground and slashed.
- 4 Man's coat early 18th century.
- 5 Glove said to be of Henry VIII's era, but possibly of James I's as suggested by the style of decoration and the alternating thistle of Scotland and rose of England. The satin cuff embroidered with coloured silks, silver gilt thread and seed pearls, is fringed with gold and silver lace.
- 6 Shoe and clog (early 18th century) silk damask and brocaded front.

The Persians wore as court dress a modification of the Assyrian garment including the turban and curled hair and beard. Their native headdress was a "Phrygian" hood, sometimes worn with a veil or scarf across the mouth to keep the dust out, like the *litham* of the Turke. Small felt hats, square topped or round, were worn as their descendants are to this day, a wasted tunic and gaily coloured pyjama trousers confined at the ankle, were characteristic of the Persian male costume, so far as it was not influenced by that of Mesopotamia.

In later times in Persia we find the Sassanian kings wearing a development of the old Persian dress, with high tunics and many chaplets and necklaces of beads, earrings, etc. The hair was worn very bushy, over the shoulders, this was characteristic of the men. We know little of what the Persian women wore.

MINOAN COSTUME

The Bronze Age in Greece—From the contemporary representations of the men and women of the Bronze age in Greece we can gather a very good idea of their costume. The men wore a very scanty dress, considering the fact that in winter and in the mountains everywhere in Greece the climate is sometimes cold. It consisted principally of a waistcloth tightly folded round the loins, sometimes with the addition of a conspicuous special heath or codpiece for the penis, and confined at the waist by a large and very tight belt. Naturally the Cretans have unusually small waists, a characteristic of the race to this day. This seems, judging by the universal testimony of the statues and wall paintings, to have been artificially accentuated from youth by tight belting, so that the men appear with waists like wasps. It even seems probable that in the case of the young men the belt was of metal, riveted on the boyhood, and retained till manhood, so that the young men had waists artificially constricted to the size of those of small boys. In middle age it would seem that this ringle was removed, and the body eventually assumed a normal form. Statuettes of older men show them as somewhat obese. The women often wore the same constricting belt when young. In form it was generally bevelled. Over the tight waistcloth was worn a kilt, in court dress apparently ornamented by a hanging fringe of network (Knossos frescoes, etc.). This kilt, sometimes with the sheath showing, is carefully represented in the Egyptian wall-paintings of the Keftian ambassadors to Egypt in the time of the XVIIth Dynasty (see Egypt). It was gaily ornamented with zigzag and other patterns, thus contrasting vividly with the white kilt of the Egyptians. Sometimes this kilt is of considerable length, reaching to the calf of the leg, at other times it, or a development of the waistcloth resembling our bathing-drawers or

FIG. 1—PRINCE AND THE WARRIOR
WARRIOR VASE HAGIA TRIADA

at the waist like those worn by the priestesses, and usually white. Normally the men wore the hair unshorn, and falling loose to the waist or below it, on the top of the head it was done up into fantastic knots or curls (horns) which were carefully represented by the Egyptian artists as that characteristic. Fashion evidently dictated various modifications of this hair dressing, more or less elaborate. Sometimes part of the hair was piled up in coils on the top of the head, while the rest hung loose about the body (Tylosian figure, Knossos frescoes, etc.).

FIG. 2—DRESS OF A
GREEK WARRIOR IN PRO-
CESSION ON WARRIOR
VASE MYCENAE

Sometimes, in the case of warriors, it was all knotted up in a "bun" or chignon at the top or back of the head like that of a Sikh. At other times it was twisted (plaited) in a pigtail (Knossos relief vase) or simply tied behind at the neck in 18th century fashion (Vaphio cup) or confined by bands or shdks at the top or sides or back (Chetlin vase). A fresco (unpublished) in the Ashmolean Museum shows it tied up in three spirally bunches, one at the back of the neck, one at the top of the head and the third over the forehead. Headgear was not common, but we have representations of a broad brimmed hat, the later Greek *phakos* (Leiden Museum, fig. 4), and of small round caps evidently concealing a topknot. A god (?) can wear a turban, or is shown wearing a high headress of peacock (?) feathers (Knossos fresco). Metal helmets of Roman rather than of Greek form, with a domed crown, ear pieces and with a knob at the top were worn, sometimes with the addition of nodding crests, the forerunners of the *adspora* of later days. The hair is sometimes invisible, being evidently knotted beneath the helmet, or is shown falling down the back, when it is worn (gladiators vase). We have representations of cuirasses on the clay tablets, but usually armour does not appear, or was perhaps of a laminated type like that worn by the Philistines, Shardana and other "Peoples of the Sea" in the Mediterranean area at the end of the Bronze age. The shield was of a peculiar double shape like the figure 8, and reached from ankle to neck, replaced by a smaller round shield at the end of the period, which was of non-Minoan (probably central European—Hellenic) origin. The usual weapons were a rapier like sword with decorated hilt, though rarely (Mylia) a great broadsword appears (typical of the Philistines and Shardana later, like the round shield and laminated body armour), daggers, and spear-heads of a peculiar rounded form somewhat resembling the mediaeval Japanese, bows and arrows with barbed metal heads, and slings were also used. The Cretan slingers were always renowned.

FIG. 3—MINOANS IN THE TOMBS

RHYTON AND STANDING BULL

early classical Greek (Iron age) fashion. The kilt was common to men as also to the Hittites of Anatolia.

During the early classical period, Greek men wore their hair long, but not so long as the Minoans. Generally reaching the small of the back, it was worn either hanging in loose ringlets (sometimes with a band at the neck), or else braided in two plaits that were wound round the head (we have no instance of this fashion in Minoan times), rolled round a headband, or knotted in a *κροσίδας* at the back of the head. Short hair did not come into fashion until the second quarter of the fifth century, after the

puttees, or high boots like those still universally worn in thorn and stony Crete, of soft white leather. The arms and neck were decorated with bracelets and necklaces of gold or silver, or stone and *kyanos* (glass heads). Then, next to the narrow waist, the most characteristic note of Minoan male costume, the hair, was evidently worn at its full natural length. Occasionally it is seen cut short, but this would seem to be so only in the case of mourning men and priests, the latter seem to have worn long robes, confined

Persian wars, and then was retained (except, as now, in the case of priests) for 1,000 years, throughout the classical Greek and Roman periods until the fall of the Roman Empire, when the "barbarian" fashion of long hair came in again. A difference between Minoan and classical Greek costume is seen in the fact that the early Greek men often went more or less naked, they habitually exposed their persons in a way that the Minoans never did. We have only one certain representation of a naked Minoan, and he is swimming, and one doubtful, the "Blue Boy" or saffron gatherer on a fresco from Knossos. There is none of women (see below). Women's hair in the early Iron age was always worn hanging, in tresses, over the shoulders, sometimes confined at the neck by a band. (For classical Greek dress see section "Greek and Roman.")

Minoan women wore a heavy petticoat-like skirted and flounced garment reaching the ankles and a sort of short sleeved "zouave" jacket, sometimes with a tight belt like the men. This dress was gaily ornamented with patterned designs. The flounces of the skirt make it resemble curiously the fashionable European skirts of the '70s and '80s.

Breasts were exposed or protected by sheaths. But no representation of a nude woman exists. A cloak with a high "Mediterranean" collar behind is represented. On the head are various forms of headgear, some times a high blunted conical *polos* (Knossos), sometimes a sort of flat turban. Generally the hair flowed loose, but is always represented as clipped considerably shorter than that of the men, which must have been unshorn from childhood, judging by its length, the hair of the women rarely reaches the waist. It is not often knotted up or entirely concealed beneath the head-dress. Bare heads were perhaps rare in the case of the women until the Late Minoan period (c. 1500 B.C.) when we see a court fashion of bare heads with the hair partly knotted behind, partly falling at the sides in comparatively short curls, the fashion much resembling that of the ladies of the courts of Louis XIV and Charles II, with perhaps a touch of the French Second Empire coiffure associated with the Empress Eugénie (Knossos frescoes). With this golden diadems were often worn, of a type resembling those of classical times (*ibid.*, Mycenae, Tiryns frescoes). Necklaces of gold, lapis and glass of the peculiar Minoan blue (*kyanos*), were of course worn, and possibly ear-rings by the women. We have only one representation of a man wearing ear-rings, and that is doubtful (cupbearer fresco, Knossos). Egyptian and Asiatic men and women both wore ear-rings and ear studs, the Egyptians from about 1500 B.C., and not before. Elaborate gold hairpins were used by the Minoan women, golden harpins of simpler form also by the men, as we see from their discovery with weapons in tombs of men at Mycenae. They would of course be as necessary for the heavy male coiffure as for the women's hair. The women's shoes are rather a doubtful point, probably their feet were usually unshod. Priestesses wore long waisted robes which were also worn by priests, apparently, or temple-musicians of the male sex, as in Lydia. When they participated in the games, as in the religious sport of the bull-leaping (*tauromachia*) the girls wore the young men's dress of tight belt and wastcoat (Knossos fresco, etc.).

Generally we know more of the male costume than the female, owing to the greater number of representations of men, and the fact of their double costume, for war as well as peace. At present it is difficult, except in the case of the women, to confine certain costumes to certain periods, as our knowledge increases it will be possible to do this as accurately as we now can do it in the case of the Egyptians, for our much greater Egyptian material.

The female costume is even more unlike that of classical times than the male, though in the Early Iron Greek age women still

wore a full skirt tightly confined at the waist, just as the men often wore a tight belt round the waist in the Minoan fashion, but without any clout or sheath.

We have practically no representations of children, so cannot say whether their costume differed in any notable way from that of their elders. An ivory figure of a boy god is shown with hair long, flowing from beneath his tiara, but much shorter than that of the men. He wears the tight waist belt. A head of a boy on a sealing has short hair.

EGYPTIAN COSTUME

Until the 18th Dynasty men in the way of costume wore a simple white kilt, which under the 12th Dynasty was often made very high, so that it began almost immediately under the armpits. It was often starched and stiff in the case of persons of some rank. Kings wore more particoloured garments, of the same general type, in archaic days unconventional clothes were apparently worn by them, which later fell out of use. In early days the natural hair was worn long, and the kings kept it in a linen bag of characteristic shape, to exclude the dust, with a pigtail behind, which in later times was retained as a specifically royal head-dress, pigtail and all, although the head was usually shaved and a short wig worn. Wigs were probably introduced very early, and it may well be imagined that the discomfort of thick and long hair in the Egyptian climate conducted to their invention. We certainly find them in use as early as the Old Kingdom, and a fringe of false hair was found in a 1st Dynasty tomb at Abydos. Under the 4th and 5th Dynasties a short wig of curls cut step wise was popular, wigless heads are rare. Under the 17th, we have at the British Museum two companion figures of a noble wearing each a different type of kilt, and one a short wig, the other a skullcap. Under the 12th Dynasty the hair was kept short close to the skull rather than shaved, and the wig was of a longer and very conventional type, men are often represented without it. Under the 13th Dynasty the wig grows longer still, and either it (or possibly the natural hair?) is dressed in three masses, one over each shoulder, the third down the back, something like contemporary female fashion (see below), but not plaited.

Under the 18th Dynasty the long natural hair was commonly worn again, sometimes simply parted in the middle and combed down over the shoulders, but far more usually surmounted by a short wig, so that we see the natural hair falling in front of the ears to the level of the chin or shoulder, while the short artificial wig above it is cut off diagonally across the ears, and forms a square fringe of curls in front. Many men however undoubtedly shaved the head, as of old, and wore nothing but a wig, usually imitating the combed wig and long hair fashion, the shoulder locks being stiff curls as artificial as the rest. In the Ramesseid period all men of position appear to have shaved the head and

to have worn wigs of this type, priests now usually wear no wig.

FIG 5.—SHARDANA GUARDS WITH BROAD WORDS

form was used besides the archaic "step" form. Under the Ptolemies and Romans Egyptian men seem to have generally dispensed with wigs, appearing always with carefully shaven crowns. Boys at all times preserved the ancient juvenile fashion of shaving only part of the head, generally the left side, and wearing a single thick plat of their own hair over the right ear, hanging below the shoulder, wigs were an attribute of manhood. Royal princes of mature age wore an imitation of this lock to indicate their filial relationship to the king and a particular rank of priest wore it combined with a short wig over the rest of the scalp,

WOMEN'S DRESS, 18TH AND 19TH CENTURIES

- 1 Lady's dress of Chinese painted silk, England. The period is the second half of the 18th century.
- 2 An American 19th century dress (1810) of checked blue silk.
- 3 An American 18th century dress, Robe à la Française, of flowered yellow silk.
- 4 Late Victorian dress (England (1880) made of silk with flounces of tassel trimming.
- 5 Gold gauze dress of the era of George IV (1820-30).
- 6 Victorian dress (England (c. 1865-70). This evening gown of silk gauze shows the polonaise and the fringe trimming of the period.

TRENDS IN WOMEN'S DRESS—EARLY 20TH CENTURY

- and 3 1900 The S curve was built in and skirts swept the floor; day and evening trimmings were profuse. The tailored daytime dress with short postillon back jacket, tight fitting sleeves and shirtwaist was trimmed with velvet, beading, embroidery, buttons and braid.
- 4 1900 For evening, the same S curve, the skirt a bit more sweeping than for day. An extreme décolleté, lace edged chiffon flou, lace strips in the brocade skirt and a jeweled buckle on the velvet belt.
- 5 1920 Hats overturned into massive inverted buckets, as this black tulle

over white lace designed for late summer.

- 5 and 6 1910 Skirts slowly straightened and became a bit shorter. By 1910 they began to clear the ground (fig 6) and at one point shrank into the hobble skirt. The waistline loosened, shoulders sloped.
- 7 1910 Heavy beading and metallic embroidery on net became the evening fashion, often topped with a beaded or feathered headdress. The décolleté less extreme, sleeves almost always present, even for evening

TRENDS IN WOMEN'S DRESS AT MID-20TH CENTURY

- 1 1917 The first important post-World War I change: Dior's New Look, with rounded shoulders and hips billowing skirt and hemline averaging 34 in. from the floor. Here a black wool suit with tight bodice, pulled-in waist and padded hips.
- 2 1946 The great bouffant ball dress: an inevitable release after wartime fashion restrictions. A Dior model using layers of white tulle and tulle, shorter in front, and worn under a voluminous coat.
- 3 1951 The noodle: soft, fluffy and slanted eye make up.
- 4 1951 Fitted coat in shaggy wool by Hattie Carnegie.
- 5 1950 Dior model with oblique side swiping scarf out in one with the jacket and a skin-tight skirt.

through a hole in which the plait emerged, as a religious vestment Caps, or hats, except occasionally a light skull cap, were not worn till Roman days. Peasants habitually wore their natural hair more or less long, and usually worked naked or with but a close fitting waist clout, as they do to-day. Under the 18th Dynasty men's dress became more elaborate, over the waist clout or kilt a long linen robe was worn, carefully fluted or gauffed, depending from just below the navel, while a cape or semi sleeved jacket of similar material covered the shoulders.

Necklaces were worn more commonly than before, and such things as bangles, while ear-rings or ear-studs were now introduced from Asia and were worn after the middle of the dynasty as ordinarily by men as by women. The studs (of rosette shape) were large and made a great hole in the lobe, which is always indicated in the statuary of this time, and found on the mummies. Later on, after the 20th Dynasty, these great ear-studs were no longer worn by men, and after the 22nd women also seem to have given them up. But small ear-rings were certainly worn by men as well as by women under the Sates, though the piercing of the lobe necessary for them was not noticeable enough to be represented in the statues. Shoes, or sandals of reed or palm-fibre were now usual for the better classes, earlier the feet had always been bare.

The elaborate dress of the 18th Dynasty persisted with little alteration till Ptolemaic times, although under the Sates men are often represented archaistically as wearing only the kilt, as under the Old Kingdom. In Roman times a new fashioned garment with *dagged* borders leaving one shoulder bare, was introduced. The royal crown proper , which remained the same from the 1st Dynasty till Roman times, was composed of two parts, , the upper, white, for Upper Egypt, and , red, for Lower Egypt. A peculiar blue royal helm, , was introduced under the 18th Dynasty.

Women—The early dress of women was a close-fitting garment, often blue, with a yoke over the shoulders and a "hobble" skirt. Wigs were early worn over the natural hair which is shown parted in the middle beneath it in a 4th Dynasty statue in the British Museum. Except under the 13th Dynasty, when the men's coiffure was as long as that of the women, the women's wigs were always longer than the men's. Under the 12th the hair, real or false, was worn in a peculiar style, in two masses, bound with gold, and turned up and outwards at the ends on the breasts. These masses were mostly of small plaits. This coiffure continued till the 18th Dynasty, when it was succeeded by a more flowing coiffure of plaits and curls. Certainly women sometimes had shaven heads beneath their wigs like the men, but the natural hair was no doubt commonly worn long by them, whereas it never was by the men after the pre-dynastic period except possibly under the 13th and certainly under the 18th Dynasty. Towards the end of the 18th Dynasty fashionable women took to exposing their shaven polls, which they never had done before, dropping the use of the wig altogether. Queen Nefertiti wore a high cap or *polos* on her shaven crown, with *mfalas* or ribbons hanging from it behind, but her daughters are represented with shaven, and what is more, deformed skulls, it is evident that the practice of elongating the female skull in childhood rather on the style of the Botocudos Indian of Brazil, the Incas or the Solomon Islanders, was fashionable at the Amarna period. This fashion seems not to have persisted for any length of time, but the royal women

certainly continued to shave their heads, and go without wigs, in order to wear certain headdresses with convenience, for a long time afterwards. The female mummies of this and later time usually exhibit a mixture of real and false hair when the "hair" is not wholly a wig. But one woman, an unknown person buried in the tomb of Amenhotep II., has very long natural hair. Small girls often wore part of their natural hair plaited at the side to signify youth like the boy's sidelock, or even often had their heads partially shaved in complete imitation of the boys. The older tight dress which we see represented till the end in the case of goddesses, gave way under the 18th Dynasty to a more gracious costume of gauffed linen, on much the same lines as that of the men, but of a more flowing and robe like character. Particoloured robes are worn by queens. Necklaces, ear studs, sandals, etc., are the same as the men's, though the women do not wear sandals so often as the men. This general costume continued till the end, when colours came in, in the late Roman period elaborately patterned caped or shawled garments were worn. Women often seem to have worn a lily on their heads, and both sexes at festivals were fond of placing a lump of highly scented unguent on the head, which is carefully represented in the tomb paintings and stelae. In Roman times women (and men at feasts) wore large wreaths, Greek costume was then no doubt largely worn by both sexes. Otherwise only the queens wore anything in the way of a headdress (see above). (H R H)

GREEK AND ROMAN

Sources of information about the dress of the ancient Greeks and Romans are to be found in their literature, their sculpture and their painted vases. Existing examples, though mostly provincial and late in origin, are also of some historical interest. In primitive times, among both the Greeks and Romans one voluminous cloak was thought sufficient dress for a man, and even in later times it was the only garment regarded as indispensable. A tunic or shift was nevertheless worn by men, women and children. At first it appears to have been sleeveless, but individual fancy and variations due to colonization or conquest caused much diversity in apparel. Among the Romans the tunic was often ornamented. The *tunica palmata* was worn at triumphs. Men of senatorial rank wore a tunic with a double stripe in purple down the front (*tunica latidavia*). Knights had a narrow stripe from each shoulder downwards (*tunica angusticlavia*). In this latter form the tunic went into common use. A man's linen tunic of Graeco Roman times from Egypt has the two purple stripes as well as double sleeve bands. Other tunics found in Egypt were more richly adorned. One for a child has in addition a roundel on each shoulder, and two others both on front and back. In course of time the simple slit for thrusting the head through was shaped or cut away in front. Two tunics were sometimes worn, as time passed (and probably always among the peasantry) no other garment was considered necessary.

The cloak, worn over the tunic, varied much at different times and places. Among the Greeks it usually took the form of a large oblong cloth wrapped about the body so as to envelop it from the neck to the ankles. The Romans used a similar garment, known as the *pallium*. But the distinctive Roman cloak was the toga, a large cloth in the form of the segment of a circle (rather less than a semi-circle) worn with the straight side uppermost. One end came forward over the left shoulder reaching nearly to the ground. The garment was then passed round the back, over (or under) the right arm, and across the front, the other end being thrown over the left shoulder to fall behind. There were variations in manner of wearing and in shape according to time and place. The toga was laid aside when there was work to be done. In later times it became a ceremonial garment, gradually losing its amplitude until it was no more than an ornamental band worn over the shoulder by certain officials. A few shreds of men's and women's garments, too incomplete to betray their form, have been excavated at various times from Greek graves of the 3rd to the 5th century B.C. in the Crimea. They are chiefly of wool, though linen has been found (see TEXTILES AND EMBROIDERIES). Though apparently Greeks and Romans both favoured undyed wool for garments, these specimens from the Crimea

FIG. 7.—SIDE OF THE PAINTED POTTERY LARNAX FROM CRETE

are mostly coloured (generally purple or green). Some are plain or striped, others have woven, embroidered or painted designs. The ornamentation includes deities, figures on horseback, chariots, birds, vines, hollyhock and scrolls.

In Graeco Roman Egypt the cloak is oblong, and often of ample dimensions. It is variously ornamented, with figures, animals, birds, fishes, trees, plants, foliage and conventional patterns. The Roman cloak was put to a variety of uses. It might be spread over a bed or couch or laid on the floor. It served also as a shroud for burial.

Those found in Egypt have all been used at last for enveloping the dead. The tunic and the cloak were the chief garments of Greek and Roman times, but various others were also worn in different places and on particular occasions. One among them, the *chlamys*, may be mentioned. It was a kind of short mantle or scarf, apparently more ornamented (as a rule) than the large cloak.

In shape it seems to have been either a narrow oblong or the segment of a circle. The garments of the Greek and Roman women were more voluminous than the men's, but otherwise they did not differ greatly in classical times. Instead of the toga, women wore the *stola*, with the *pallium* over it. Men often went barefooted, but leather or wood sandals and buskins were worn. Women wore shoes, and carried fans and parasols. Knitted socks, and knitted or netted caps, hair nets and bags have been found in abundance in Egypt. Caps of fur and leather, and broad brimmed hats, were worn on occasion. Brooches, clasps and girdles were used, especially by the women, but the skill of the wearer in adjusting the cloak seems to have been chiefly relied on for keeping it in position.

MÆDIAEVAL AND MODERN

The tunic and cloak, which were the principal garments worn in Greek and Roman times, continued to hold their place, with modifications, for many centuries. As the tunic became the chief garment, it was sometimes elaborately decorated. One early Christian writer speaks of people wearing garments on which animals, forests, mountains or huntsmen were figured, while on others were biblical scenes. Late pagan and early Christian garments, found in Egypt, have ornamentation of this nature.

Mædiaeval—At the time of the Norman conquest of England the dress of men and women consisted of a couple of tunics and a loose cloak. The chief innovation was the tight "chausses" or hose enveloping the legs, in classical antiquity trousers were a barbarian garb. From the two tunics were evolved the jackets, pourpoints, jupons, jerkins and doublets of later times, and from the short cloaks the various over garments, often taking fanciful shapes in the middle ages. Patterned materials were often used, though apparently not quite so much as they were afterwards. It is probable that the initials and devices personal to the wearer, seen in the 14th and 15th centuries, were for the most part of embroidery. They might occur once on the sleeve or shoulder, or they would be powdered over the whole garment. The large painted portrait of Richard II of England in the sanctuary at Westminster Abbey shows his robe powdered with crowned Rs and presumably the letters sometimes to be seen on the dresses of unidentified individuals in paintings and tapestries had a personal significance. Another portrait of this king, on the celebrated diptych in the possession of the earls of Pembroke at Wilton, shows his mantle covered with crouching harts. The white hart was his personal badge and again it explains other instances of such devices, though it should be remembered that fanciful representations of this kind formed part of the general repertory of the pattern designer in mediæval times. By the middle of the 15th century, rich velvets, with variations of the lobed 'Gothic' pattern, often wrought with gold thread, were much used for costume among the well-to-do.

Only a summary statement of the changes which dress went through during the middle ages and later times can be given here. The following outline has more particular reference to England, but generally speaking it holds good for western Europe, and (where applicable) to America. Some developments might occur

easier in France or Italy, where many fashions originated, and they would tend to survive later in the north.

What may be described as "tailoring," as distinct from drapery, comes into notice about the end of the 13th century. Garments then began to be shaped more to the body, leaving less liberty of adjustment to the wearer. In the latter part of the 14th century "dagging" (the cutting of the edges of the garments into fanciful shapes) takes an exaggerated form, which it keeps for half a century or more.

For head-coverings the plain white wimple began to give way, towards the end of the 14th century, to elaborate head dresses—the horned, the mitre, the turban—culminating in the fantastic steeple head dress or "benim" of the later 15th century, from France. In the 14th century men wore a kind of hood turned sideways on the head. This was followed by a closefitting cap which, towards the third quarter of the 15th century, was heightened so as to resemble the Turkish "fez" after which it became lower and flatter.

Shoes, which in early times were for the most part of fur or leather, tied by thongs round the instep or ankles, gradually took form with sole and uppers approximately more or less to the shape of the foot, until in the 14th century a tendency to bring the toes to a sharp point is noticeable. In the later years of this century the uppers were sometimes pierced in fanciful shapes. Chaucer refers to this practice when he speaks of the priest Abalon having "Paul's windows carved on the shoes." Shoes with Gothic tracery over the instep were shown in the wall paintings representing King Edward III and members of his family, formerly in St Stephen's chapel at Westminster. At the end of the century the shoes of Richard II are covered with quatrefoils and discs. The "Cracowe" or "poulaine," from Poland, with pointed toes of greatly exaggerated length, then followed, until at the end of the 15th century the fashion ran to the opposite extreme.

16th and 17th Centuries—In the first half of the 16th century took place the meeting of the French and English kings at the "Field of the Cloth of Gold." This phrase only reflects general tendencies of the time, when fashionable men's clothes were loaded with jewels, and they are said to have spent their fortunes upon their clothes. Early in the 16th century the hose were divided into stockings (*buis de-chausses*) and trunk-hose (*haut-de-chausses*). The trunk-hose went through various phases, looser or tighter, shorter or longer, following caprice rather than any progressive evolution.

The slitting of men's sleeves at the elbow or shoulder, to display the garment underneath, was not unusual in the 15th century, but "slashing" in small parallel cuts is a feature of the next century. By the time of Charles I the slashes became long slits, sometimes extending for practically the whole length of the sleeves, before disappearing altogether. In the latter half of the 16th century men's garments began to be "bombasted" with cotton-wool, hair or sawdust. They form a contrast to the dress of Van Dyck's sitters a few years later. The air of elegant refinement, which must have been due in some degree to the dress itself, is so noticeable in this artist's portraits, that far on in the following century painters would endeavour to recapture some of this glamour by representing their sitters in similar garb. Women's farthingales, in the latter half of the 16th century, extended their skirts to very ample size. The euphuism of the time is reflected in dress, and exaggerated conceits form the subject of embroidery. In a portrait of Queen Elizabeth in the possession of the marquis of Salisbury at Hatfield house, her cloak is embroidered all over with human eyes and ears which, with a serpent on the sleeve, betokened the vigilance and wisdom of the wearer. A more restrained type of ornamentation, chiefly used for linen garments, such as tunics and men's and women's caps, was done entirely in black silk thread. Hence it gained the name of blackwork.

It is said to have been brought to England by Catherine of Aragon. Naturalistic flowers were a favourite motive, but badges, rebuses, book illustrations of enigmatic import, and all kinds of fanciful conceits were also included. As time went on, richness was added by the use of heavy gold thread for stems and other details, and later in the century bright colours replaced the black.

In this form, chiefly for floral patterns, it survived well into the 17th century.

The development of the frill at the neck into the great starched and pleated ruff, with its supporting standard, is a noticeable feature of the time. Completely encircling the neck, at first, towards the end of the 16th century it was sometimes worn open in front. Soon afterwards it was replaced by the falling collar, but the encircling ruff and the open ruff were still worn well into the 17th century, as so many Dutch portraits bear witness.

Brims are added to men's caps early in the 16th century, and modifications rapidly succeed one another. In the second half of the century men and women wore higher and stiffer head dresses. The 17th century brings in the "steeple" hat, and then the leather hat with broad brim and feathers. The broad toad shoe with parallel slits or slashes is followed by a shoe in which the tilting at the heel begins. A solid corked sole comes first, then a space is cut through under the instep, to be followed by a separate heel piece.

Children's portraits show that it was customary to dress boys and girls, even those of a tender age, very much in imitation of their elders.

About 1660 an important change took place in men's garments, when coat and vest were first evolved as distinct garments in France. This fashion was carried to England by Charles II. At first the vest was long, reaching to the knees and sleeved. The coat was slightly longer.

The coat and waistcoat of the present day are directly descended from these garments.

The trunk hose are full, though very soon after they might have been worn narrower, anticipating the buckled knee breeches of the 18th century. About this time, instead of the natural hair falling to the shoulders, men took to wearing the large periwigs so characteristic of the portraits of Louis XIV and his contemporaries, at the end of the century they tower over the brow, giving added height to the wearer. Cravats, often of rich lace, now replace the falling collar. A notable fashion originating in France took its name from the battle of Steinkerke, fought in 1692. The French officers dressing in haste, it is said, tied their fine lace cravats loosely about their necks. This fashion spread to other countries, both for men and women, and lasted some years.

Women's skirts were full at this time, and bodices were laced in front, sometimes with an embroidered stomacher. Hat-brims were now cocked, developing at the end of the century into the three-cornered hat.

Muffs were carried both by men and women in the 17th century, and in various forms they continued in use by women well into the present century. Gloves first became conspicuous in the 16th century, when they were often elaborately embroidered and sometimes embellished with pearls and jewels as well. In the 17th century, when the frill at the wrist gave place to the turned-back linen cuff, large gauntlets were added to the gloves, giving scope for embroidery in the style of the time. A pair of gloves was a customary gift at the New Year, and pains were taken to render them worthy of acceptance. Such gloves were usually of leather, but subsequently various lighter materials were used, and gloves might reach beyond the elbow when sleeves were short.

18th Century.—At the beginning of the 18th century the skirts of men's coats had become fuller and the sleeves had wide cuffs. The sleeved waistcoat was shortened, and at times it was richly embroidered. In course of time the sleeves disappear. As the century advances a distant approximation to the frock-coat of later times is discernible, but the materials continue to be rich. Velvet, often woven in tiny diaper patterns, was much used. When the material was plainer, elaborate embroidery in silk, often embellished with glass beads and spangles, was usual for fashionable dress. During the course of the century, the skirts of the coat and the corners of the waistcoat were cut away in front, reducing the form more nearly to that of morning-dress of the present day.

Embroidery was used for ladies' dresses, especially for the

underskirts rendered visible by the open front of the dress. The silk brocades of Lyons or Spitalfields, with floral patterns in bright colours, came into use. Indian dyed or embroidered cottons, and Chinese painted silks, witnesses to the growing commerce between the maritime nations of Europe and the far east, were made into dresses, causing much searching of heart among weavers at home, who succeeded in getting restrictive enactments put into force. Towards the middle of the century skirts became very ample, being supported by very wide hoops.

The sack or sacque, a loose dress falling straight from the shoulders, continued in use during the greater part of the century. It had originated about 30 years earlier, when Pepys's wife "first put on her French gown called a sack." Later dresses, too, came from France. A letter of the year 1715 from Sarah, duchess of Marlborough to Lord Stur, ambassador at Paris, is still extant—asking him to obtain "two pair more of bodys and a night gown" for her, and a manteau and petticoat for her grandchild. In the latter half of the 18th century women wore their hair, or wigs, dressed high above the head and powdered, and again men's wigs became larger, but they were already doomed, and Pitt's powder tax of 1795 practically put an end to them.

19th Century.—By the opening of the 19th century, the change in men's outlook had swept away much of the overloaded finery of the past and garments more supple and better suited for active life came into use. Men's coats are cut away in front in a manner resembling the modern dress coat, the lapels are large and the collar is high and deep. Waistcoats are short and cut square. Knee breeches are lengthened into the modern trousers. The cocked hat of the 18th century is replaced by the top-hat. The old full dress, moreover, gradually gives way to what we now call the lounge suit, used more and more for all occasions.

Women's dress at the opening of the century is marked by a graceful simplicity, with high waist and low neck. A lower waist and puffed sleeves follow. Meanwhile skirts were widening, until the "crinolines" took their most exaggerated form shortly after the middle of the century. Then followed various adaptations of 18th century styles. About 1880 the projecting "bustle" at the back was in full popularity. Fringes, trimmings, flounces and long trains were in use during the latter part of the century.

FAR EASTERN

The appearance, customs and personal characteristics of Chinese, Japanese and Koreans are distinctly different, and this has consequently brought about dissimilarities in the dress. Only within the last few decades when European costumes have to some extent been adopted, has there been any tendency to uniformity in style.

China.—All classes in China wear a *san* (jacket) and *hoo* (trousers), the combination being similar to the Western pyjamas. There are three kinds of each—the single, the lined and the wadded with cotton, to suit the season of the year. To the *san* is attached a narrow collar-band. The *ma kua* is the ordinary jacket with loose sleeves for the common people, and the *bashun*, a sort of vest, is worn over it. The *po* is a long gown and the *qua* a larger and longer *ma kua*. The *po kua* is the official full dress of men, while the *lung po*, or dragon gown, was worn by the emperor at State ceremonies. There are several other gowns in use—the *Chang san* in summer, *chiao* in spring and autumn and *tamou* in winter. When it is very cold the *pipao*, or fur coat, takes the place of the *tamou*. The *lo pang*, another kind of overcoat of silk or fur, is worn by the wealthy.

There are all kinds of coats embroidered with dragons, moons, stars, hills, mountains, waters and flowers. Each design has its peculiar symbolism, frequently it is a Buddhist emblem or the representation of some philosophical concept, such as the "waves of eternity." The mandarins were specially privileged to wear

gold-embroidered clothes, and sometimes the emperor granted the nine orders of mandarin the distinction of wearing a peacock feather on the hat.

Red is a symbol for happiness, and thus we find the bride wearing an elaborate gown of red, the tassel on the top of men's hats and the cord on their *questes* are red.

Japan—In A.D. 283 two women weavers were sent from Korea to Japan to teach the making of figured silks and brocades. The *ho* or ceremonial garment of the Japanese emperor and nobles, has an ancient origin, the Chinese seamstresses came to Japan, about A.D. 300 and made this with silk imported from China. Emperor Yuryaku (A.D. 457-479) reformed the national dress and, in the reign of Emperor Suiko (A.D. 593), rank was signified by distinctive headgear a custom imitated from that of the Chinese Tang dynasty (A.D. 618-906). Costumes were evolved for civilians, ecclesiastics and the militia, differing in colour, patterns, the length of sleeves and the style of hairdressing.

The *kasune*, or loose tunic, was worn with a short lower garment called the *akome*. The *hakama* was a loose skirt reaching only a few inches below the knees over the *shita-gutsu*, or socks. The whole style of headgear was called *suberakashi*. *Kommuri*, a ceremonial headdress, was secured by *konyashi*, or pins and the *yebachi*, or cap, was worn over it.

The ladies always wear the *kimono*, a loose gown with a neck piece called an *eri*, and long sleeves, the garment being fastened by a belt. Since the Heian period (794-1159) women have in general dispensed with the *hakama*, and to day the female dress for social occasions consists of an undershirt, two or three outer garments and a *haori*, or interlined silk coat, over the upper part. The *obi*, a belt about 3 yd long and 10 in wide, winds about the figure.

Men in rural districts are barefooted, seldom wear *sori* or the wooden clogs called *geta*, and in the hot season they wear almost no clothing. The common jacket and trousers of cotton crepe, blue or white in colour, a large grass hat called *kasa* and straw *sori* are the ordinary dress.

Korea—Among the six departments of the Korean government was the board of rites, whose duty was to regulate, describe and govern the ceremonial code of polite society, including dress. Koreans dressed according to their class, and in each class distinct costumes were used by those of different ages.

A *chugori* (jacket) and *baps* (trousers) are worn by all classes. The *sooroomaki*, a long flowing tunic, goes over these to anywhere between the knees and ankles, the higher the man's position, the more garments he wears. All these are of varying thickness to suit the weather. Women's *chugori* do not descend to the waist, leaving space for a waistband, or *huridi*, which is embroidered and woven by hand. (Y. K.)

TWENTIETH CENTURY

The evolution of modern feminine dress, corresponding closely to the emancipation of women at the beginning of the 20th century, provides one of the most captivating pages in the history of modern civilization. One often considers ridiculous the fashions of other days, but one has only to live the past over impartially to understand that all changes in fashion are rungs in a ladder leading to an inconstant ideal.

Fashions of 1900-25—In 1900 women were filled underclothes. The body was imprisoned in a corset that pushed the bust forward and the lower part of the body out behind. The hair was dressed so as to follow the movement of the body. The neck was stiffened by a collar with whalebone stays. The sleeves, bodice and hat were trimmed with puffs and frills, details that at first view appeared useless but that helped to conceal the twisted line of the body. This silhouette remained without appreciable change up to 1905 when a step back to *fin de siècle* fashions occurred. Sleeves were again puffed at the top, bodices were shaped to a point in front and the complicated dresses were covered with a profusion of puffs and frills. The hat was perched on the side of the head above a display of hair extravagantly curled, it was frequently trimmed with a cluster of feathers, a mode of delicate hat trimming that, changing place very often, lasted until 1914. The high collar made almost its last appearance. In 1909 a col-

lar that freed the neck was popular. During the same year the short skirt appeared for the first time in the 20th century, a short skirt, however, that would have seemed very long later. Enormous hats were loaded with huge, falling feathers. Already the silhouette was being slightly straightened, the bust was less bent and the body a little less deformed by the corset.

So far the few progressive changes in costume were the straightening of the silhouette and the freeing of the neck. They prepared the way for the *directoire* fashions which, already having made a few timid appearances, began to reign definitively in 1910. A bloom of delicate and varied colours was obtained during this period by concealing the dress beneath a transparent tunic of a different shade.

Two years later, in 1912, under the influence of a few Russian ballets, the *directoire* began to orientalize itself. Trouser skirts appeared, heads were turbaned and dresses of bright colours were trimmed with gold embroidery, pearls and diamonds. After 1912 dresses no longer hid the elegant woman's feet and she began to match the colour of her shoes and dress. The oriental influence transmitted by the theatre became, in 1913, dazzling. The trouser skirt persisted next to the skirt tightly draped round the legs, it was surmounted by a short and puffed tunic which very often took the shape of a small crinoline.

The period from 1914 to 1920 was not notable in the history of fashion. Only the year 1917 created a specific line, the barrel dress, which was not seen the following year but which, for some time afterwards, left its traces in a draped movement. From 1914 to 1920 there was nothing worthy of entry in the history of fashion.

In 1921 a new line, the low waist of the "flapper," was found. At the same time the skirt was lengthened slightly. In 1923 the low waist dress was transformed into a straight dress called the *tube dress*, and from this was born the costume—the straight and short dress—which was generally unchanged to 1929.

At its birth in 1924 it was quite simple, so much so, indeed, that it demanded equal simplicity in dressing the hair, which women began to cut like men. Dresses being simple in shape and trimming, the feminine costume tended to fall into dullness. Feminine elegance was saved by research in accessories and by the use of new materials. The seeking of harmony in the smallest details proceeded further, appearing in the make up which in former days had been used simply to correct faults of nature.

(R. DE T. E., X.)

Fashions from 1925 to World War II—The uniformity which had nearly reached a banal monotony during the preceding years changed during 1928 to a silhouette with a great deal of movement. The hemline began to dip in back until it almost reached the floor, particularly in evening gowns. During the day, the "sports" feeling, which had continually increased during each successive year, became even more marked. Physical exercise and intelligent diet had given the athletic figure of woman a slender, active look, and rhythm had taken the place of heartiness. The hipline remained moulded, with a flat front and back, while the waistline, above, was felt rather than defined. Hats, which had completely covered the forehead and eyebrows, were beginning to show them again.

By 1929 the hard silhouette of 1925 and 1926 was completely overturned. The higher waistline and longer skirtline was, bit by bit, coming into being. Sports clothes became longer—four inches below the knee being the popular length. Trains on evening gowns appeared, giving even greater grace to costumes, but the skirt remained short in front. Clothes again became complicated—almost fussy.

Then there followed the long skirts which at first women trailed through the streets in the daytime. In the course of time the novelty of the long skirt was gradually adjusted and assumed its proper place, for evening. The daytime skirt was worn seven or eight inches below the knee. A softer treatment for bobbed hair ruled. By 1930 the long skirt had at last a sure foothold. The young so-called "flapper" had become submerged. She had greeted as a new and exciting experience the feel of a long skirt swishing about her ankles. Her coats were fitted at the waist,

her slouch became dignified rhythm, and legs and knees were hidden.

The year 1931 ushered in a very graceful and flitting era of spiral treatments in evening dresses that clung to the figure. The motion picture had begun its powerful influence, and women were dramatizing their clothes far more than they ever had before. Inhibitions about colour were abolished. Gaiety, a reaction from the drabness of former years became the exciting gesture of the day. The financial crisis had caused a rather clever pseudo bravado. It was considered chic to be poor. Fewer clothes were in once overflowing wardrobes, which seemed to give an added impulse to inventive designers.

In the 1930s the pill-box hat, the beret, and the sporty felt were also introduced. All of these had great popularity. Hats tilted over the left eye. Women remained slim and straight. The evening gown with a high neck in front, the low back and long sleeves became ever present, even on those occasions when, several years before, only the lowest décolleté would have been correct. Gradually, too, a masculine note crept in. Mannish suits were worn for daytime, sport coats were adapted from various masculine sources, and evening clothes displayed a definite masculine trend.

For daytime wear, shoulders began to play an important part in the trend of fashion. Evening gowns displayed huge ruffled puff sleeves—a mode introduced by a popular motion picture. In 1934 the silhouette also encouraged the revival and adaptation of fashions of 1910. This rather florid, but amusing era, was reconstructed with a simplified modern treatment. The clinging body flaring into a series of frothy flounces below the knee dominated the scene. (G. Ad., X.)

World War II Fashions.—During the abnormal period of World War II, fashion trends, like most other phases of life, were sharply influenced by or directly traceable to the cataclysm of war. Silhouettes showed no remarkable variations. The natural kind of line which prevailed just before the war continued to prevail until well after 1945. Regulations limiting yardage in U.S. women's clothes had a great deal of influence in this respect. Then, in 1945, out of Paris, there emerged a complete new trend toward roundness. Shoulders and sleeves were padded to curve outward in big arcs, waists tightened to curve in, hips belled out by much padding and pleating.

Hemlines were a bit more active. They crept up on daytime dresses in 1940, the U.S. had taken over most of the world's designing, and U.S. women liked to show off their legs. Then in 1941 came the ballet-length evening dress, six or even ten inches above the floor.

Suits came close to establishing themselves as the paramount fashion of the war period. What was formerly a costume for tailored days in town became a uniform for 24 hours a day, seven days a week, everywhere. Women in defense jobs or camp-following their husbands found one suit worth a half-dozen dresses, and infinitely variable by means of blouses and jerseys. The suit itself took to many forms and fabrics. Only at the war's end did women tire of suits.

Dresses, after succumbing to the influence of the Austrian dirndl for a while, began to become slim, tubular, ready. With the introduction of the rounded line in 1945, however, all this changed to swelling curves and dolman sleeves.

"Separates," something new and characteristically U.S. in fashion, often substituted for dresses. These were outfits of several pieces—skirt, jacket, shirt, halter, long skirt—which could be combined and varied in numberless ways. Evening clothes became slim and straight of line. Wool was often used in dinner dresses, a new necessity in heatless houses and with the restricted use of automobiles the floor-length dress disappeared almost completely.

Shoes staged their own revolution with the introduction of "flats," ballet shoes and wedge shoes. Women, while appreciating and envying the comfort of low-heeled shoes, had always resented their heavy "sensible" look and were now inspired by the success of espadrilles and peasant sandals.

In 1947 fashion made headlines with the change in hemline

and silhouette originating in Paris. Day skirts were longer, about 12 in. from the floor, and evening skirts shorter. Every natural curve in the woman's figure was accentuated. The "new look" as it was named by the press, called for natural, sloping shoulders, tiny waists, rounded hips, often padded to increase the natural curve.

But the "new look" suddenly collapsed in 1948. In its place came another complete reaction. Clothes were pared, clipped, cropped and chopped to the point of sparseness. Jackets were shorter and fitted till they were merely little buttoned bouffants, rib tight. Skirts were straight in front and at the sides, and any fullness was at the back.

The end of 1949 found fashion apparently headed for a revival of the 1920s, but this rather extreme trend modified itself greatly by mid century. Some silhouettes of the flapper age remained but were so modernized as to be hardly detectable. The chemise dress was popular, but it was worn with a belt which allowed for a wastline, high or low, tight or loose.

Other reminiscent features in the early 1950s were the helmet hats, sleevelessness, dangle earrings, long ropes of pearls and the boyish wind swept coiffures that strongly recalled the flapper era.

DRESSER, in furniture, a form of sideboard. The name is derived from the Fr. *dressoir*, a piece of furniture used to range or *dresser* the more costly appointments of the table. The appliance is the direct descendant of the credence and the buffet, and is, indeed, a much more legitimate inheritor of their functions than the modern sideboard, which, as we know it, is practically an 18th-century invention. It developed into its present shape about the second quarter of the 17th century, and has since then changed but little.

As a piece of movable furniture it was made rarely, if at all, after the beginning of the 19th century until the revival of interest in what is called "farmhouse furniture" at the very beginning of the 20th century led in the first place to the construction of many imitation antique dressers from derelict pieces of old oak, and especially from panels of chests, and in the second to the making of avowed imitations.

The dresser conformed to a model which varied only in detail and in ornament. Its simple and agreeable form consisted of a long and rather narrow table or slab, with drawers or cupboard doors beneath and a tall upright closed in back arranged with a varying number of shallow shelves for the reception of plates, hooks for mugs were often fixed upon the face of these shelves. Toward the end of the 17th century small cupboards were often added to the superstructure. The majority of these dressers were made of oak, but when, early in the Georgian period mahogany came into general use, they were frequently inlaid with that wood, holly and box were also used for inlaying, most frequently in the shape of plain bands or lines. A peculiarly effective combination of oak and mahogany is found in the dressers, as in other "farmhouse furniture," made on the borders of Staffordshire and Shropshire. The excellence of the work of this kind in that district and in the country lying west of it may perhaps explain the expression "Welsh dresser," which is now no more than a trade term, not necessarily suggestive of the place of origin, but applied to all dressers of this type.

In Europe, they are most frequently found in the houses of small yeomen and substantial farmers, into which fashion penetrated slowly.

In the United States, the term *dresser* is more commonly applied to a piece of bedroom furniture consisting of a chest of drawers, or bureau, with a mirror attached—a sort of dressing table. This application was no doubt brought about by its use as a convenience in dressing or attiring one's self.

DREUX, a town of northwestern France, capital of an arrondissement in the department of Eure-et-Loir, 27 mi. N.N.W. of Chartres by rail. Pop. (1946) 14,184. Dreux was the capital of the Gallic tribe of the *Durocasses*. In 1188 it was taken and burned by the English, and in 1562 Gaspard de Coligny, and Louis I, prince of Condé, were defeated there by Anne de Montmorency and Francis, duke of Guise. In 1593 Henry IV captured the town. It was occupied by the Germans in Oct. 1870,

was later evacuated, and again taken, on Nov. 17, by General von Tresckow. In the 10th century Dreux was the chief town of a county, which Odo, count of Chartres, ceded to King Robert. Later, Louis VI gave it to his son Robert, whose grandson Peter of Dreux, younger brother of Count Robert III, became duke of Brittany by his marriage with Alix, daughter of Constance of Brittany by her second husband Guy of Thouars. By the marriage of the countess Jeanne II with Louis, viscount of Thouars (d. 1390), the Capetian county of Dreux passed into the Thouars family. In 1377 and 1378, however, Perronelle and Marguerite, two of the three co-heiresses of Jeanne, sold their shares of the county to King Charles V. Charles VI gave it to Arnaud Amanieu d'Albret, but took it back in order to give it to his brother Louis of Orléans (1407), later he gave it back to the lords of Albret. Francis of Cleves laid claim to it in the 16th century as heir of the d'Albrets of Orval, but the parlement of Paris declared the county to be crown property. It was given to Catherine de' Medici (1539), then to Francis, duke of Alençon (1569), it was pledged to Charles de Bourbon, count of Soissons, and through him passed to the houses of Orléans. Vendôme and Condé. Dreux stands on the Blaise, which there divides into several arms. It is overlooked from the north by a hill with a ruined mediaeval castle, within the enclosure of which is a gorgeous chapel, begun in 1816 by the dowager duchess of Orléans and completed and adorned by Louis Philippe. It contains the tombs of the Orléans family, chief among them that of Louis Philippe, whose remains were removed from England to Dreux in 1876. The sculptures on the tombs and the stained glass of the chapel windows are masterpieces of modern art. The older of the two hotels de ville of Dreux was built in the early 16th century, chiefly by Clément Metzeau, the founder of a famous family of architects, natives of the town. It is notable for the carvings of the façade and for the staircase. The church of St. Pierre is Gothic and contains good stained glass and other works of art. Dreux is the seat of a subprefect. Among the public institutions are tribunals of first instance and of commerce. The manufacture of boots and electric fittings and metal-founding are carried on, and there is also a trade in wheat and poultry.

(X)

Battle of Dreux (1562).—The battle of Dreux was the first regular engagement of the Huguenot Wars in France, and it was fought on Dec. 19, 1562. Henry II, king of France, was accidentally killed at a tourney in 1559, and was succeeded by his ten year old son, Charles IX., whose mother, Catherine de' Medici, claimed the right to conduct the government. On March 1, 1562, the duke of Guise massacred 60 Huguenots at Vassy and the leaders of the reformed faith, Condé and Admiral de Coligny, appealed to the Queen but received no satisfaction. War now began, the Huguenots being declared rebels. As they were vastly in the minority they sought assistance from England and Germany, obtaining promises of money from the first, and 9,000 riders and landsknechts from the second. Leaving d'Andelot and his 9,000 Germans at Orléans, in November, Condé made a dash for Paris, but found Guise and Saint-André already there. To gain time to collect her forces, the Queen-mother made overtures for peace, but as no result was reached, on Dec. 10 Condé moved on Chartres, the royal army following and threatening Orléans. Condé now wished to counter-march on Paris, but Coligny persuaded him to move into Normandy and join hands with an English force which had landed there. Thus it came about that the army marched on Dreux. There the Huguenots found their road blocked, and though inferior in numbers were compelled to accept battle, for as Coligny said "We must now look to our hands to save us, not to our feet." On each side the left wing was victorious. In all some 6,000 were killed or wounded, and though no true decision was gained the royalists held the field. Marshal Saint-André and the duke of Nevers were killed on the royalist side, and Condé was taken prisoner. After the battle Coligny withdrew his men in good order to Beaugency. The forces engaged were approximately 4,000 horse and 8,000 infantry on the side of the Huguenots, and 3,000 horse and 13,000 infantry on that of the royalists.

Annale Hist des Princes de Condé pendant les XVI^e et XVII^e siècles (1864), *The Cambridge Modern History*, vol. 11 (1904) (J F C F)

DREW, the name of a family of American actors. JOHN DREW (1827-1862) was born in Dublin and made his first New York appearance in 1846. He played Irish and light comedy parts with success in all the American cities, and was manager of the Arch street theatre in Philadelphia. He visited England in 1855, and Australia in 1859, he died in Philadelphia. His wife, LOUISE LANE DREW (1826-1897), was the daughter of a London actor, and in 1827 went to America, appearing as the Duke of York to the elder Booth's Richard III, and as Albert to Edwin Forrest's William Tell. After this she starred as a child actress, and then as leading lady. She had been twice married before she became Mrs. Drew in 1850. From 1861 to 1892 she had the management of the Arch street theatre in Philadelphia. In 1880 she toured with Joseph Jefferson in his elaborate revival of *The Rivals*, playing Mrs. Malaprop to perfection. She had three children, John, Sidney and Georgiana, wife of Maurice Barrymore (1847-1905), and mother of Lionel, Ethel and John Barrymore, all actors.

The eldest son, JOHN DREW (1853-1927), began his stage career under his mother's management in Philadelphia as Plumper in *Cool as a Cucumber*, March 22, 1873, and after playing with Edwin Booth and others, became leading man in Augustin Daly's company in 1879. His association with this company, and with Ada Rehan as the leading lady, constituted a brilliant period in recent stage history, his Petruchio being only one, though perhaps the most striking, of a series of famous impersonations. In 1892 he left Daly's company, and began a career as a "star," appearing among other plays in *A Marriage of Convenience*, *One Summer Day*, *Richard Carvel*, *Much Ado About Nothing*, *The Will*, *The Circle* (1921-23), *School for Scandal* (1923), *Trelawney of the Wells* (1925-26-27). He died in San Francisco (Calif.), July 9, 1927, while on tour.

See Moses, *Famous Actor Families in America* (1906), Winter, *Wallet of Time* (1913).

DREWENZ, a river of Germany, a right-bank tributary of the Vistula. It rises on the plateau of Hohenstein in East Prussia, 5 m. S.W. of the town of Hohenstein. After passing through the lake of Drewenz (7 m. long), it flows south west through flat marshy country, and forms, from just below the town of Stassburg to that of Leibsch, a distance of 30 m., the frontier between East Prussia and Poland. After a course of 148 m. it enters the Vistula from the right, a little above the fortress of Thorn.

DREWS, ARTHUR (1865-1935), German philosopher, was born on Nov. 1 at Utersen, Holstein, and was educated at Munich, Berlin, Heidelberg and Halle. From 1898 he was professor at the polytechnic academy in Karlsruhe. His contributions to the critical appreciation and history of philosophy are *Die deutsche Spekulation seit Kant* (1893), *Kants Naturphilosophie* (1894), *Das Ich als Grundproblem der Metaphysik* (1899), *Das Lebenswerk E. V. Hartmanns* (1907), *Nietzsches Philosophie* (1904), *Plotin* (1908), *Die Philosophie im 19. Jhr* (1912), *Gesch. des Monismus im Altertum* (1913). His support of concrete monism and an ultimate Being devoid of consciousness and personality is best seen in his *Die Religion als Selbstbewusstsein Gottes* (1906), *Der Monismus* (1908) and *Fress Religion* (3rd ed., 1921).

DREXEL, ANTHONY JOSEPH (1826-1893), American banker, was born in Philadelphia (Pa.) Sept. 13, 1826. He was the son of Francis M. Drexel (1792-1863), founder of the banking house of Drexel and Co. Anthony, with his brothers Francis and Joseph, succeeded to the control of the business, and organized the banking houses of Drexel, Morgan and Co., New York, and of Drexel, Hays and Co., Paris. In 1864 with George W. Childs he purchased the Philadelphia *Public Ledger*, and with him in 1892 founded the Fraternity Home for union men at Colorado Springs. In 1891 he founded and endowed the Drexel Institute of Art, Science and Industry in Philadelphia. He died at Carlsbad, Bohemia, June 30, 1893.

DREYER, JOHN LOUIS EMIL (1852-1926), Danish astronomer, was born at Copenhagen on Feb. 13, 1852, and was educated in his native town. In 1874 he became astronomer at

the earl of Rosse's observatory at Birr Castle, Ireland. He remained in Ireland, holding the post of assistant astronomer at the Royal Observatory, Dunsink, from 1878 to 1882, and of director of the observatory at Armagh from 1882 until he retired in 1916. Dreyer's work in astronomy falls into two groups—his observations on nebulae and on the motion of stars, and his work on the history of astronomy. His astronomical observations were started at the Rosse observatory, where the telescope was particularly suitable for his purposes, and continued at Dunsink and Armagh. Dreyer is the author of a number of papers on nebulae and stars, and of *Second Armagh Catalogue of 3,200 Stars* (1886). His "New General Catalogue of Nebulae and Clusters of Stars," published in the *Memoirs of the Royal Astronomical Society* (1888), with supplements in 1895 and 1908, is a standard work. He was particularly interested in the work of Tycho Brahe and wrote *Tycho Brahe, a Picture of Scientific Life and Work in the 16th century* (1890), and prepared a complete edition of Tycho Brahe's work, *Tycho Brahe Opera Omnia*. The first volume was published in 1913, ten volumes appeared before Dreyer's death, and the remaining four were complete in manuscript. Dreyer held many academic honours. He died on Sept. 14, 1926.

DREYFUS, ALFRED (1859-1935), French soldier, was born on Oct. 9, 1859, the son of a Mulhouse manufacturer. After studying at the *école polytechnique*, he entered the army as a lieutenant of artillery. He became a captain in 1889, passed through the *école supérieure de la guerre* (staff college), and received an appointment in the Ministry of War. His name is famous because of the judicial error of which he was the victim, which was repaired only after an agitation which disturbed France for many years and aroused deep feeling all over the world. During the summer of 1894, an anonymous letter abstracted from the German embassy was communicated to the Ministry of War. It had been addressed to the military attaché, Col. von Schwarzkoppen. This letter known as the *bordereau*, or schedule, because it had originally been written as a covering letter to certain military memoranda, enumerated the documents which its writer hoped to send to Schwarzkoppen. A French officer was evidently betraying his country. It happened unfortunately that the writing of the *bordereau* was like that of Dreyfus. Suspicion fell upon him, and he was arrested on Oct. 15. He always maintained his innocence, but by reason of the similarity of the hand writing, appearances were against him. Actual evidence was, however, extremely scanty. For this reason, Gen. Mercier, the minister of war, placed before the members of the court-martial secret documents, utterly valueless as evidence, but which could not fail to impress them. This was done unknown to the prisoner and his counsel, the famous M. Demange, and the fact did not leak out until several years later. On Dec. 22, 1894, Alfred Dreyfus was unanimously found guilty and condemned to detention for life in a fortified area. On March 15, 1895, he was interned on Devil's island, one of the archipelago of the Safety islands off the coast of Guiana. His family never ceased to believe in his innocence. His brother, Mathieu Dreyfus, convinced a terrible judicial error had been committed, strove incessantly to have the case reviewed. This could not be done, however, unless some new facts were brought to light.

An official at the Ministry of War, entirely unconnected with the Dreyfus family, made the necessary discovery. Col. Picquart was the head of the information branch which had to do with the affairs of the secret service. In March 1896 he became possessed of the fragments of an express letter which Col. von Schwarzkoppen, the German military attaché, had torn up, unsent, and thrown into the waste-paper basket. It had been found by a French agent. This express letter, known as the "*petit bleu*," was addressed to a French officer, Maj. Esterhazy, and proved that he was in the pay of Schwarzkoppen. On making enquiry Picquart found that Esterhazy led a dissipated life and was heavily in debt. He then discovered that the *bordereau*, wrongly attributed to Dreyfus, was in Esterhazy's hand writing. Convinced that Dreyfus was innocent and Esterhazy guilty, he laid his information before his superior officers, Gen. de Bousdreff and Gen. Gonse, the chief and deputy chief of the general staff. They, however

still convinced of Dreyfus' guilt, and unwilling to have the matter reopened forbade him to pursue his enquiries, and when he said he could not die with such information undisclosed had him transferred to a distant part of Tunisia. About that time, Col. Henry, the deputy director of the information branch, brought forward a letter apparently from Col. Panizzardi, the Italian military attaché. Dreyfus was referred to in it in terms which, had it been genuine, would have left no doubt of his guilt. The letter was, however, a forgery, and the discovery of this fact led to the first revision of the case. Col. Picquart, before starting for Africa, had told the whole story to his friend the lawyer, M. Leblois. Leblois discussed it with Schœrer Kestner, a well known politician who was vice president of the senate. He became convinced of Dreyfus' innocence, and began to agitate in his favour. At the same time (Nov. 1897) M. Vieuch Dreyfus had by the merest chance come to realize that the writing of the *bordereau* was that of Esterhazy. On Nov. 15, 1897, he wrote to the minister of war accusing Esterhazy of the crime for which his brother had been condemned. The general staff was unwilling to own that a mistake had been made. Esterhazy was formally court-martialed, but his acquittal was secured. At the same time a press campaign of extraordinary violence broke out against those who were working for the revision of the 1894 sentence. They were represented as traitors to their country. Col. Picquart was thrown into prison on the pretext that he had communicated confidential papers to a civilian (M. Leblois). The cause of Dreyfus had, nevertheless, gained many supporters, especially in intellectual circles. Georges Clemenceau and Francis H. Pressence in the newly founded *Aurore*, and Yves Guyot, Joseph Reinach and others in the *Sicile* set on foot an agitation which did not cease till justice had been done. On Jan. 13, 1898, two days after Esterhazy's acquittal, *Aurore* published in *Aurore* under the title "*L'accuse*" the famous open letter to the president of the republic, in which he denounced the efforts which were being made to stifle the truth. At the instance of the Ministry of War, proceedings were taken against him. The case was heard in February. His lawyers, Labori and Albert Clemenceau, brother of the statesman, called many witnesses to the innocence of Dreyfus and convinced a large section of the public. But opinion on the whole was still unfavourable. Zola was condemned to a year's imprisonment. He later took refuge in England for a time.

As the call for revision grew more and more insistent, Cavaignac, minister for war in Brisson's cabinet, tried to arrest it by reading aloud in the chamber on July 7, 1898, the alleged letter from Panizzardi which had been brought forward by Col. Henry some months before. Soon after, however, on Aug. 30, it was made clear that it had been forged by its seeming discoverer, who was arrested and committed suicide in his cell at Mt. Valérien. This decided the Government to lay the demand made by Mme Dreyfus for revision of the original sentence before the court of appeal. After months of enquiry, the court annulled the sentence of 1894 and ordered a new trial before a court-martial at Rennes. Little by little the cause of Dreyfus was gaining ground. Loubet, who became president of the republic on the death of Félix Faure in Feb. 1899, was favourably inclined to it, as was also the cabinet of Waldeck Rousseau, which came into power in June. But feeling still ran high, especially in military circles. Dreyfus was brought back from Guiana. The new trial lasted a month. On Sept. 9, 1899, the court martial at Rennes by five votes to two delivered an incoherent judgment by which Dreyfus was found guilty with extenuating circumstances, and condemned to ten years' imprisonment. This amazed the general public. On Sept. 19 the Government decided to pardon Dreyfus. He was immediately set at liberty, and after a short stay at Geneva, settled in Paris. At the end of 1903 further facts which came to light led to a demand for a second hearing by the court of appeal, and a further long and detailed enquiry. On July 12, 1906, the court of appeal finally quashed the sentence of 1894. Dreyfus was completely rehabilitated. A Government measure reinstating him in the army with the rank of major of artillery was immediately passed. He was employed for a year in a military office at St. Denis near Paris and resigned in July 1907. In June 1908, on the

occasion of the transfer of the ashes of Zola in the Pantheon, an anti Semite journalist Gregori, fired two shots at him, one of which wounded him slightly

He entered the army during World War I, was promoted lieutenant colonel in 1918 and shortly afterward an officer of the Legion of Honour. After that he lived in retirement until his death in Paris, July 12, 1935.

BIBLIOGRAPHY—Dreyfus' letters written in captivity have been published under the title *Lettres d'un Innocent* (1898). His memoirs entitled *Cinq années de ma vie* appeared in 1901. The shorthand reports of the various trials have been published (some by the Librairie Stock of Paris and others by the Ligue des Droits de l'Homme). See also Joseph Reinach, *Histoire de l'affaire Dreyfus*, 7 vol. (1901-11); Theodore Reinach, *Histoire sommaire de l'affaire Dreyfus* (1924), and an anti-Dreyfusite work by Dutrait-Crozon, *Précis de l'affaire Dreyfus* (1909). (P B)

DREYSCHOCK, ALEXANDER (1818-1869), Czech pianist and composer, was born at Zak, Caslau, Bohemia, on Oct 15, 1818.

He studied at Prague and in 1838 began to tour Europe as a virtuoso. He became popular with the audiences of Europe, his repertory including his own compositions as well as classical pieces. His compositions, however, were soon forgotten. Most of his original music was in the so called salon music category.

In 1862 he became professor of the pianoforte at the Conservatory at St Petersburg (later Leningrad). Also appointed court pianist and director of the imperial school for theatrical music, he later went to Italy.

He died at Venice on April 1, 1869.

RAIMUND DREYSCHOCK (1824-1869), born at Zak on Aug 30, 1824, the brother of Alexander, was professor of violin at the Leipzig conservatory and concertmaster of the well-known Gewandhaus orchestra there.

He died in Leipzig on Feb 6, 1869.

DRIESCH, HANS ADOLF EDUARD (1867-1941), German biologist and philosopher, was born on Oct 28, 1867, at Kreuznach. After studying at Hamburg, Freiburg, Munich and Jena, he travelled in the far east, and from 1891 to 1900 worked in the zoological station of Naples.

He then settled in Heidelberg where in 1909 he became Privat-docent and in 1911 professor of philosophy. In 1920 he was made professor at Cologne and in 1921 at Leipzig. Driesch began as a disciple of Haeckel but through the influence of G Wolff and W Roux came to support a dynamic vitalism.

His doctrine that the functions of protoplasm cannot be explained mechanically was the outcome of experiments on the blastula of the sea urchin, which showed that any fragment cut at random always gave a complete embryo, and on the restitution of animal parts.

From these experiments he concluded that the organism must be a harmonious equipotential system possessing a vital individualizing entelechy which works through the matter with a view to the whole. He also maintained that instinct and action are inexplicable mechanically.

His antimechanism in the psychological sphere is seen in his *Leib und Seele* (Leipzig, 1920, Eng trans with a full bibliography of his works, 1927).

His other important works were *Analytische Theorie der organischen Entwicklung* (Leipzig, 1894), *Science and Philosophy of the Organism* (Gifford lectures, 1907-08), *History and Theory of Vitalism* (1914), *The Problem of Individuality* (1914), *Wissen und Denken* (Leipzig, 1919), *The Crisis in Psychology* (Princeton lectures, 1925).

He became known internationally and lectured in China, Japan and the United States. Awarded honorary degrees by many universities, he was a member of many scientific societies of Europe.

During a visit to Harvard university in 1926 he advocated "an eventual United States of the world." But in 1934, a year after Adolf Hitler's rise to power, he was won over to the ideas championed by national socialism and incorporated them into his philosophic teachings.

He died in Leipzig in April 1941.

DRIFFIELD, a market town and urban district, 28 mi E by

N from York, in the Bridlington parliamentary division of the East Riding of Yorkshire, Eng. Pop (1951) 6,888. Area 3.8 sq mi. It is a railway junction and the centre of an agricultural district, and its industries include agricultural implements and milk products, flour milling and sugar refining. A canal connects it with Hull. Driffield's history goes back at least to Saxon times and there was once a palace there. All Saints' church (restored) is Norman and Early English.

DRIFT see GLACIAL EPOCH

DRILL In military science, the word *drillen* was used in Dutch, German and Danish from the 17th century for training in military exercises and was adopted into English in the same sense. The origin of the application seems to be in the primary sense of "to turn round," from the turning of the troops in their evolutions and from the turning of the weapons in the soldiers' hands.

Drill is, formally, the preparation of soldiers for their duties in war by the practice or rehearsal of movements in military order and the handling of arms, and, psychologically, the method of producing in the individual soldier habits of self control and of mechanically precise actions under disturbing conditions and of rendering the common instinctive will of a body of men, large or small, amenable to the control of and susceptible to a stimulus imparted by its commander's will. (See ARMY, INFANTRY, ROMAN ARMY.)

In textiles, drill is the name of a fabric made in both linen and cotton and commonly bleached and finished stiff. The word is a shortened form of "drilling," from the German *drillich*, or "three threaded," and is so named because the weave originally used in its construction is what is termed the three leaf twill, nine repeats of which appear in the accompanying figure, while immediately below the design is an intersection of all the nine threads with the first pick. It is essentially a warp faced fabric, that is,

TWO DRILL DESIGNS
Three leaf twill, a warp faced fabric

Large quantities of drill are shipped to the eastern markets and to other subtropical countries. It is also used for military tropical uniforms and for jackets, overalls etc.

In agriculture, a furrow in which seed may be sown is known as a drill. The word is somewhat doubtful in origin. It may be the same as an obsolete word "drill," to trickle, flow in drops, also a small stream or flow of water, a rill, and is possibly an altered form of "trill." Drill is also the name of an agricultural machine used for sowing seed or distributing manure (see ILLAGE MACHINERY).

(See also AGRICULTURE. A GENERAL SURVEY, AGRICULTURAL POWER AND MACHINERY, SOWING.)

DRILL, a large, short tailed baboon from the Cameroons, resembling the mandrill but with a black face. The lower lip is bright crimson and the hairs around the face are yellowish white as is a tuft behind the ears. The rest of the animal is yellow brown. (See BABOON, MANDRILL, PRIMATES.) (J E HL)

DRILLING, PETROLEUM Two basic methods are used for drilling wells to produce oil and gas. Cable tool drilling, the older of the two, employs the impact action of a bit suspended on a steel drilling cable. This assembly is reciprocated in vertical motion to cut a hole in the earth. The bore, so cut, is almost empty of fluid and the cuttings produced by bit action are removed from the hole at intervals by withdrawing the bit and bailing out. Until the early 1900s, cable tool drilling was the principal system in use, but it was generally replaced by the rotary tool method for the majority of wells drilled.

With rotary tools a bit designed to cut in rotary motion is carried on an assembled string of drill pipe so arranged that it may be rotated and raised or lowered in the well bore as desired. The hole being cut is filled with fluid called drilling mud. This fluid is continuously circulated down through the drill pipe, out the bit nozzles and thence returned to the earth's surface in the annular space between the drill pipe and the wall of the borehole. Circulation of the fluid serves continuously to remove the bit cuttings while also cooling and lubricating the bit and by hydrostatic head prevents the inflow of gas, oil or water from formations penetrated into the hole being cut.

Drilling rigs are built in wide variety to meet the requirements of depths to be drilled, loads to be handled and terrain where wells are located. Many rigs for comparatively shallow depths are truck and trailer mounted to provide mobility and economy in moving from one location to another and for rapid rigging up. Where well locations are in swamps, canals and open water, rigs are frequently built on barges which are towed to locations and set in place by sinking in the desired position. Other rigs, of the heavier types for deep well drilling, must be taken to location in several units and assembled in place. Through use of complex machinery, alloy steels and powerful engines, many drilling rigs are capable of depths in excess of 20,000 ft.

The main sources of power for drilling are internal combustion engines of the spark plug type, using natural gas or LPG (liquefied petroleum gas) products, especially butane and propane. Diesel engines rank second and are followed to a much lesser extent by steam engines and electric power. The modern drilling rig utilizes a variety of power transmission methods, including hydraulic couplings, torque converters, automatic transmissions, V belts, chain and ordinary gear drives. Controls for operating the hoisting equipment called the "draw works," rotary table and drilling fluid pumps (slush pumps or mud hogs) involve ordinary mechanical means plus pneumatic, hydraulic and electrical remote controls. All the control devices are actuated from the driller's position on the rig floor adjacent to the draw works. Also placed there are instruments necessary to the operation of the drilling equipment, including the weight indicator, to show total load on the derrick and weight on the bit at the bottom of the hole, pressure gauges for the slush pumps, both indicating and recording, torque indicator to show rotative loads on the drill pipe and tachometers, temperature, air pressure, oil pressure and ammeter for the engines powering the rig.

The hole being bored should usually be as nearly vertical as possible. Subsurface devices are used either to make a continuous survey of the drift of the borehole or to check its deviation intermittently from the vertical. Sometimes it is desirable to slant a bore intentionally at a specified angle in some desired direction. This practice involves special drilling methods which must be carefully checked with subsurface surveying instruments. Drilling fluids are carefully controlled. It is vital that the mud fluid be of sufficient weight to hold back fluid pressure encountered in formations penetrated, that viscosity be proper for the removal of cuttings from the hole and that free fluid or "water loss" be controlled so that abnormally thick caking will not occur on the wall of the hole.

Drilling fluids are usually made with water as the base, to which are added clay compounds, weighting materials and chemicals for obtaining the desired characteristics. Other drilling fluids are prepared with oils and are known as oil base muds.

Steel pipe, called casing is run into the hole as required to prevent hole caving and blowout of high-pressure oil and gas and, finally, to provide for producing from the selected formation. Casings are sealed in place and protected by "oil well cementing." This involves pumping a liquid slurry of portland cement in water down through the casing and up into the space between it and the bore and allowing it to harden in place. These cements are adapted to specific conditions by addition agents to control setting time, pumpability and final hardness.

With the formation behind the casing sealed after cementing, the hole may be carried deeper at reduced size by drilling down through the casing thus set or, if a producing formation has

been penetrated, the casing may be perforated by shooting with projectiles or explosive jets lowered through the casing on cable containing an electric conductor. Cementing serves to seal off water, oil or gas from escaping to the surface or from one earth formation to another. It is important in well completions to exclude undesired water or excessive gas, or both, from the oil production; otherwise, gas pressure is wasted or oil and gas production flooded out.

It is a common practice when completing wells where the casing is either set through the producing zone and perforated, or landed above the producing zone and completion made in open hole, to apply chemical and hydraulic methods to secure production. Hydrochloric acid mixtures containing corrosion inhibitors and other chemicals are used in limestone formations. Other chemical solutions are used to rid limestone or sandstone of the mud used in drilling which may have penetrated and partially blocked the pores of the formation.

Another important well completion practice is hydraulic fracturing. This procedure cracks the producing formation rocks by pressure applied by fluids pumped into the well. The fractures so produced provide channels in the rock for flow of oil and gas into the bore of the well.

During drilling operations and prior to completion, it is possible to determine the nature and content of the drilled formations in many ways. By use of core bits a sample of the formation being cut is recovered. The bore may be electrically logged with instruments lowered on an electric conductor cable to determine factors indicative of the kind of rock and the fluids contained in it. A formation offering possible production can be tested for fluid content by drill stem or formation testing. In this instance, the drill pipe is connected to valves and packers which are lowered into the well, then sealed off in the bore to exclude the mud in the well from the formation. The valves are then opened and fluid within the packed off formation flows into the empty drill pipe, thus determining productivity without the necessity of running and setting a string of casing.

At the start of 1954 the world's deepest producing well was 27,306 ft at Weeks Island, La. At the same time, the drilling depth record was 21,482 ft in Kern county, Calif. Three wells had penetrated the 20,000 ft mark, one each in Mississippi, California and Wyoming.

DRINKING VESSELS Nature provided the primitive man with various forms of drinking vessels such as the coconut, the gourd, eggs of the larger birds, shells and even the human skull many of which have been of such practical use that they have lasted to the present day. The first artificial drinking vessels were so similar to those used for food that it is difficult to make a definite line of distinction. The races of the Neolithic and Bronze Ages furnished vessels of pottery of a beakerlike form, and later prehistoric times produced vessels of gold, bronze and other materials which seem to have been used as drinking vessels.

A specimen, resembling an early Victorian teacup on a high foot, was found by Schliemann in his exploration of the superimposed cities of Troy. It is of clay, but similar forms found at Tiryns and Mycenae are of gold. Schliemann was especially interested in a tall, trumpet-shaped cup with two earlike loop handles, a saucerboat-shaped vessel of gold, made with a lip for pouring or drinking at each end and with two loop handles, and others of gold, silver and electrum, three of which were shaped like 18th century coffee cups without handles.

Gothic and Scandinavian Types—The practice of burying with the dead warrior any property that he might need has persisted to our day the actual vessels in use by the pagan Northmen who pervaded northern Europe from the 4th century onward. Among the belongings surrounding one Saxon chieftain were five cows' horns and four glass cups. The horns were 2 ft long and richly mounted at the mouth and at the point with silver bands embossed and gilt. The glasses were of a trumpet shape, with a

small foot, while the sides were ornamented with tubes bent down ward and open on the inner side, so that the liquid would fill them. Another type was a simple cone of glass, sometimes ornamented with an applied spiral glass thread, or festoons of white glass imbedded in the body of the vessel. Still a third form was that of the "tumbler," a plain cup or bowl widely expanded at the mouth and with a rounded base, so that it could only be set down when empty. There are in the museums many other contemporary varieties, plain cylindrical goblets generally with ornamental glass threads on the outside, and a more usual type has an orange-shaped body with a wide, plain mouth. In Belgium, France and Germany the same types occur, also additional forms that do not occur in England—one of which is a drinking glass in the shape of a hunting horn with glass threads forming an ornamental design on the outside. These glass drinking vessels were popular, but a large number of small pottery vessels were found, and in one grave at Broomfield, in Essex, two small wooden cups were found. Horns as drinking vessels retained their popularity at all times, actual horns being supplanted later by horn-shaped vessels.

Church Vessels.—The drinking vessel possessing the most established history is doubtless the chalice of the Christian Church. Upon early Christian tombstones are found such vessels apparently with a symbolic intention. But it is not until about the 6th century that the sacred vessels assumed a definite form. From that time date the lost golden chalices of Monza, representations of which still exist in that city, and the famous chalice of Gourdon in the Bibliothèque Nationale in Paris is probably of about the same time. All of these are two handled with a vase shaped body supported on a high base. Two glass vases of exactly this two handled form are in the Slade collection at the British Museum, and may well have been chalices. This form seems to have been succeeded by a goblet with straight lines and without handles. Then came the rounded cup-shaped bowl as seen in the well known Kremsmünster chalice. An interesting silver vessel, probably a chalice, found at Trewiddle, in Cornwall, is in the British Museum. It is a plain semi-oval, and dates from the 9th century. The 13th century chalice was usually a broad, shallow cup, on a conical base. These gradually became taller, with a bowl smaller in proportion, so that in the 17th century both the civil and religious vessels had lost all sense of true artistic proportions. In Britain chalices ceased to be used in the English church in the reign of Edward VI and were replaced by communion cups. The chalices of the early centuries were made of various materials, glass being more practicable, with gold and silver as preferences when they could be obtained.

Mediaeval Vessels for Common Uses.—Wooden vessels, of which mazer bowls seem to have predominated, were commonly used in the 14th, 15th and 16th centuries. In the latter century they began to take on elaborate mountings, and then, as other materials came into use among the wealthy, they began to lose their popularity. Crystal, agate and other hard stones, ivory and Chinese porcelain, were all in use, as well as the precious metals. Of the cups that are preserved in the British Museum, the royal gold cup of the kings of England and France is of interest. It is of nearly pure gold with a broad bowl and a high foot, the cover pyramidal. The subjects represented on its ornamentation are scenes from the life of St. Agnes, in two rows. One on the cover and one on the bowl, on the foot are the symbols of the four Evangelists, and around the base a coronal of leaves alternating with pearls, the cover originally had a similar adjunct, but it has unfortunately been cut away. Its history has been traced from the time when it was made, about 1380, to the present time.

16th-18th Century Types.—Drinking vessels of the 15th and 16th centuries were of so many shapes, materials and decorations that most every type can be placed in that period. There were a great number of adaptations, such as the ostrich leg mounted on elaborate silver, the coco-nut used in the same way and Chinese and other Oriental wares turned into cups and vessels of various forms. Silver horns, provided with feet so as to serve as standing cups, were quite common. The elegant natural curve of the horn, often mounted with great richness, added still to the charm of the vessel. German silver-smiths made many vessels in the forms of

animals, the head generally removable so as to form a small cup. Stags, lions, bears and various birds are often found. A common type of Switzerland and South Germany was that of a figure of a peasant, generally in wood, carrying on his back a large basket, which edged with silver formed the drinking cup. A curious fancy was to make cups in the form of a globe. These are of historic value, because they show the state of geographical or astronomical knowledge at the time.

Glass cups were not common in England until the 16th century, Venice having practically a monopoly of the supply. The relations of Venice with the East were of so intimate a character that the earlier forms of Venetian glasses were nearly identical with those of the Mohammedan East. This period saw various kinds of wine glasses and goblets with enamelled and lace designs, tankards, practical but seldom graceful, beakers, resembling our modern tumblers and a common type among the Arabians.

In the 17th and 18th centuries a great impetus was given to the production of curious drinking vessels, not in the sense of spilling the many varieties of the past, but as an interesting innovation. Cups of leather, generally in the form of a lady's shoe, were common. Flagon, or "black jacks" were also of leather. The material that lent itself to a greater possibility in the field of art was that of pottery. In England at various potting centres a great number of cups called "tygs" were made. These were large mugs with three or four handles, so that the cup could be passed from one to another. Some of these have quaint devices and inscriptions. "Puzzle jugs" afforded a good deal of amusement at this time. They were jugs with open-work around the neck, and a variety of spouts, only one of which led to the liquid. The Chinese still cling to the rhinoceros horn as an object of somewhat archaic form, believing it to be an antidote for poison. The beautiful amber hue and the thickness of the horn, together with the various carved decorations, make it a vessel of unusual interest. Tea-cups with no handles, and much thinner than coffee cups, were made in China in the 18th century.

The 19th and 20th centuries have seen the manufacture and use of most every form of drinking vessel that the ancient and mediaeval times produced, after changing the shapes and materials only as a matter of commercial interest. Glass is the most widely used material, being cheaper and more practicable, while clay is a better material when it comes to retaining heat or cold. (See also GLASS, POTTERY AND PORCELAIN, SILVERSMITHS' AND GOLDSMITHS' WORK.)

DRINKWATER, JOHN (1882-1937), British poet, playwright and critic, born at Leytonstone, Essex, June 1, 1882, and educated at the Oxford high school. After 12 years' work as an insurance clerk, he devoted himself to theatrical enterprise, and became manager and producer to the Pilgrim Players, who developed into the Birmingham Repertory Theatre Co. His first volume of poems appeared in 1906 and his first play, *Cophetua* (in verse), in 1911. He subsequently published several volumes of verse, critical studies on *William Morris* (1912), *Swinburne* (1913) and others, and several plays, of which *Abraham Lincoln* (1918) was produced with great success both in London and in the United States. Among his later plays were the "chronicle dramas" *Oliver Cromwell* (1921), *Mary Stuart* (1922) and *Robert E. Lee* (1923), each of which was performed in London. In 1923 his *Collected Poems* (2 vol.) were published, and in 1925 *The Muse in Council*, a collection of essays, and his *Collected Plays* (2 vol.). In 1925 *The Pilgrim of Eternity* *Byron—a Confession*, a prose work, made its appearance. His autobiography appeared in two volumes, *Inheritance* (1931) and *Discovery* (1932). He wrote prolifically in the last years of his life, but none of his later work was of particular importance. He died March 25, 1937.

DRIP, DRIP-MOULD or **DRIPSTONE** see HOOD MOULD

DRIVER, SAMUEL ROLLES (1846-1914), English divine and Hebrew scholar, was born in Southampton on Oct. 2, 1846. He was educated at Winchester and New College, Oxford.

He was a fellow (1870) and tutor (1875) of New College, and in 1883 succeeded Pusey as regius professor of Hebrew and canon of Christ Church. He was a member of the Old Testament revision committee (1876-84) and examining chaplain to the bishop of Southwell (1884-1904). He died on Feb. 26, 1914. Dr. Driver devoted his life to the study, both textual and critical, of the Old Testament. Among his numerous works are commentaries on the books of the Old Testament. His *Introductio ad Litteraturam of the Old Testament* (1897, 9th ed., 1913) became a standard work, and exercised great influence on younger scholars. His other most important work in Hebrew scholarship is to be found in his contributions to the *Oxford Hebrew and English Lexicon of the Old Testament* (1906). A bibliography of his works is given in appendix B to Cooke's edition of *Ideals of the Prophets* (1915).

DRIVER'S INSURANCE see MOTOR VEHICLE INSURANCE

DRIVING, a word used in a restricted sense for the art of controlling and directing draught animals from a coach or other conveyance or movable machine to which they are harnessed for the purpose of traction (from "to drive", *ie* generally to propel, force along or in, a word common in various forms to the Teutonic languages). This has been an occupation practised since domesticated animals were first put to this use. In various parts of the world a number of different animals have been, and still are, so employed, of these the horse, ox, mule and ass are the most common, though their place is taken by the reindeer in northern latitudes, and by the Eskimo dog in Arctic and Antarctic regions. The driving of each of these requires special skill, only to be acquired by practice combined with knowledge of the characteristics peculiar to the several animals employed.

Under all these different conditions driving is a work of utility, of economic value to civilized society. But from very early times driving, especially of horses, has also been regarded as a sport or pastime. This probably arose in the first instance from its association with battle. In the earliest historical records, such as the Old Testament and the Homeric poems, the driver of the chariot fills a place of importance in the economy of war, and on his skill and efficiency the fate of kings, and even of kingdoms, must often have depended. The statement in the Book of Kings that Jehu the son of Nimshi was recognized from a distance by his style of driving appears to indicate that the warrior himself on occasion took the place of the professional charioteer, and although it would be unsafe to infer from the story that the pleasure derived from the occupation was his motive for doing so, the name of this king of Israel has become the eponym of drivers. Among the Greeks at an equally early period driving was a recognized form of sport, to the popularity of which Horace afterwards made allusion. Racing between teams of horses harnessed to war chariots took the place occupied by saddle-horse racing and American trotting races (*see HORSE RACING AND BREEDING*) in the sport of modern times. The element of danger gave excitement to chariot racing and kept alive its association with incidents familiar in war, just as at a later period, when the institution of chivalry had given the armed knight on horseback a conspicuous place in medieval warfare, the tournament became the most popular sport of the aristocracy throughout Europe.

Driving as it is practised to-day for pleasure without profit, and without the excitement of racing, is of quite modern development. Oliver Cromwell, indeed, met with a mishap in Hyde Park while driving a team of four horses presented to him by the count of Oldenburg, which was the subject of more than one satirical

a means of communication between different parts of Great Britain, but those who made use of them did so as a matter of necessity and not for enjoyment. But by the beginning of the 19th century the improvement in carriage building and road construction alike had greatly diminished the discomfort of travel, and interest in driving for its own sake grew so rapidly that in 1807 the first association of amateur coachmen was formed. The two principal driving clubs in recent times have been the Four-in-Hand and Coaching Clubs. The former was founded in 1854 by the then duke of Beaufort, and such was its popularity that the club could not entertain a quarter of the applications for membership. In 1870 therefore the Coaching Club was formed with the duke of Beaufort as president. The meetings of these two clubs in Hyde Park were in pre-war days a great feature of the London season, and on two or three occasions the Coaching Club mustered more than 30 coaches. The Four-in-Hand Club after an existence of over 70 years was dissolved in 1926, but the Junior Club in 1927 continued to be well supported, and in this year some 10 to 12 members drove their drags to the three meets which were held. The club at this time numbered 41 members.

Road coaching has for long been a popular pastime amongst horsemen in the British Isles. Following the suppression of the stage coaches by railways an important revival of coaching was initiated in 1866, and up to the time of the World War there were numerous well-appointed stage coaches running daily in and out of London, notably on the Brighton and Portsmouth roads. On July 13, 1888, J. Selby, the well-known professional coachman, performed his celebrated feat of driving the "Old Times" coach from London to Brighton and back in 7 hrs. and 50 mins. This drive worked out at an average pace of 13.79 m. per hour, horses being changed so smartly that with 8 teams and 14 changes the latter took altogether only 6 mins. 12 secs. Since the war, owing to economic conditions and the great increase in motor traffic most of these coaches have been compelled to come off the road, but in 1927 the "Old Berkeley" and "Venture" coaches, running respectively to Boxhill and Hampton Court had successful seasons (*see COACHING*).

In modern driving, one, two or four horses are usually employed. When a greater number than four is put in harness, as in the case of the state equipages of royal personages on occasions of ceremony, the horses are not driven but are controlled by "postillions" mounted on the rear side horse of each pair. When two horses are used they may either be placed side by side, in "double harness," which is the commoner mode of driving a pair of horses, or one following the other, in a "tandem." Four horses, or "four-in-hand," are harnessed in two pairs, one following the other, and called respectively the "leaders" and the "wheelers."

Though it is a less difficult accomplishment to drive a single horse than a tandem or four-in-hand, or even a pair, it nevertheless requires both knowledge and the skill that practice alone confers. The driver should have some knowledge of equine character, and complete familiarity with every part of the harness he uses, and with the purpose which each buckle or strap is intended to serve. The indefinable quality known in horsemanship as "good hands" is, partly at least, the result of learning the correct position for the arm and hand that holds the reins. The reins are held in the left hand, which should be kept at about the level of the lowest button of the driver's waistcoat, and near the body though not pressed against it. The driving hand should never be reached forward more than a few inches, nor raised as high as the breast. The upper arm should be loosely against the side, the forearm horizontal across the front of the body, forming a right angle or thereabouts at the elbow-joint, the wrist bent inwards, and the back of the hand and knuckles facing outwards towards the horses. In this position the three joints of the arm form a kind of automatic spring that secures the "give" to the movement of the horse's mouth which, in conjunction with firmness, is a large part of what is meant by "good hands." But this result is only obtained if the reins are also held with the proper degree of bearing on the bit. What the proper degree may be depends greatly on the character of the horses and the seyer

ity of the bit. Pulling horses must be restrained by a strong draw on their bits, such as would bring other animals to a standstill. But under no circumstances, no matter how sluggish the horses are, should the reins be allowed to lie slack. The driver should therefore always just "feel his horse's mouth" as lightly as possible, he then has the animal well under control in readiness for every emergency, while avoiding such a pull on the mouth as would cause a high spirited horse to chafe and fret.

These principles are common to all branches of the art of driving, whether of one, two or four horses. When they are observed no great difficulty confronts the coachman who is content with single or double harness, provided he has acquired the eye for pace and distance and the instinctive realization of the length of the carriage behind him, without which he may suffer collision with other vehicles, or allow insufficient room in turning a corner or entering a gateway. For before he can have had the practice by which alone this knowledge is to be gained, the beginner will have learned such elementary facts as that his horses must be held well in hand going down hill and given their heads on an ascent, and to be sparing in the use of the hand-brake, with which many modern carriages are provided. This apparatus is most useful in case of emergency or for taking weight off the carriage on a really steep descent, but the habit which too many coachmen fall into of using the brake on every trifling decline should be avoided. Its effect is that the horses are continually doing collar-work, and are thus deprived of the relief which ought to be given them by occasional light pole or shaft work.

Tandem and Four in hand.—When the ambition of the amateur coachman leads him to attempt a tandem or four-in-hand he enters on a much more complex department of the art of driving. In the first place he has now four reins instead of two to manipulate, and the increase of weight on his hand, especially when four horses are being driven, requires considerable strength of wrist to support it without tiring. It is of the first importance, moreover, that he should know instinctively the position in his hand of each of the reins, and be able automatically and instantaneously to lay a finger on any one of them. The driver who has to look at his reins to find the off-side leader's rein, or who touches the near-side wheeler's in mistake for it, is in peril of a catastrophe. It is therefore essential that the reins should be correctly disposed between the fingers of the left hand, and that the driver should as quickly as possible accustom himself to handle them automatically. The coachman should take the reins in his hand before mounting the box-seat, as otherwise his team may make a start without his having the means to control them. It is customary to hitch the reins, ready for him to take them on, behind the tug strap which supports the trace buckle and the pad of the off-side wheeler in four-in-hand or the off-side shaft bearer in tandem. Standing on the ground beside the off-side wheel of his carriage, ready to mount to the box seat, the coachman, after drawing up his reins till he almost feels the horses' mouths, must then let out about a foot of slack in his off-side reins, in order that when on his seat he may find all the reins as nearly as possible equal in length in his hand. The reins should then be transferred to the right hand disposed as they will be in the left when ready to start, but one finger lower down, the first finger will then be free to hold on to the footboard in mounting the box. When replaced in the left hand for re-mounting, the leader's reins should be operated by the forefinger and the wheeler's by the middle finger. The near leader's rein will then be uppermost of the four, between the forefinger and thumb, then between the forefinger and middle and the two reins to the near wheeler—the off leader's and the near wheeler's in the order named while at the bottom. Between the middle and third fingers is the off wheeler's rein. It will be found that if held thus the reins are held immediately in front of the hand in such a way that each wheel rein and each pair of reins—two near-side, two off-side, two wheelers', or two leaders'—can be conveniently manipulated, and the proficient driver can instinctively and instantaneously grasp any of them he chooses with his right hand without having to turn his eyes from the road before him to the reins in his hand.

Having seated himself on the box and transferred the reins thus disposed, from the right to the left hand, the coachman should shorten them till he just feels his wheelers' mouths and hold back his leaders sufficiently to prevent them quite tightening their traces. Then, when he has taken the whip from its socket in his right hand, he is ready to start. This is an operation requiring careful management, to secure that leaders and wheelers start simultaneously, for if the leaders start first they will be drawn up sharp by their bits. The moment it is desired to start, the team should be given their heads and the "office" to start by the coachman at once easing his left hand. When once started a further adjustment of the reins is usually necessary. The driver should see that his team is going straight. If the leaders and wheelers are not exactly on the same line, this or that rein must be shortened or lengthened as the case may require, and it is to be noticed that as the near-wheeler's and off leader's reins lie together between the same fingers, a simultaneous shortening or lengthening of these two reins will usually produce the desired result.

With rare exceptions, reins should be shortened or lengthened by pushing them back or drawing them forward with the right hand in front of the driving hand, and not from behind it. As soon as the team is in motion the leaders may be let out till they draw their traces taut, but draught should be taken off them on falling ground or while rounding a corner.

In rounding a corner a loop of the leaders' rein, on the side to which the turn is to be made, is taken up by the right hand and placed under the left thumb. This "points the leaders," who accordingly make the required turn, while at the same time the right hand bears lightly on the reins of the opposite side, to prevent them making the turn too sharply for safety to the coach behind them.

When the turn is made the driver's left thumb releases the loop and the team returns to the straight formation.

The Use of the Whip.—A necessary part of driving four horses or tandem is the proper use of the whip. The novice, before beginning to drive, should acquire the knack—which can only be learned by practical instruction and persistent practice—of catching up the thong of the whip on to the stick by a flick of the wrist, keeping the elbow close to one's side. Practice and considerable dexterity are required in using the whip on the leaders without at the same time touching, or at all events, alarming or fretting, the wheelers. The thong of the whip should reach the leaders from beneath the swingle or lead bar. This demands skill and accuracy, especially when striking the near leader, but no coachman is competent to drive four horses until he is able to touch with the whip any particular horse that may require it, and no other.

Essential as proficiency in the use of the whip when driving four horses, it is even more imperative for the driver of tandem. For in four-in-hand the leaders act in some measure as a restraint upon each other's freedom of action, whereas the leader in tandem is entirely independent and therefore more difficult to control.

In the usual method of harnessing a tandem the lead traces draw direct from the wheeler's trace buckles. They should never be attached to the shafts, as this is a dangerous practice. The above method entails a considerable length of trace, and a trace bearing-strap passing over the leader's loins is a necessity. Another method consists in having two swingle or lead bars similar to those used in four-in-hand, by means of which the leader's traces can be reduced to the same length as those of the wheeler. But this method is very seldom adopted.

A tandem, owing to the greater freedom of the leader from control, requires in a sense more delicate handling than a four-in-hand, but the latter supplies the coachman with problems of greater difficulty, and so of greater interest, if only for the reason that he has to deal with the various temperaments of four horses instead of two, while the weight on the hand is obviously more severe, and a heavy coach load entails extra precautions for safety, especially in driving down hill. In Great Britain the coach and-four is the more popular.

DRIZZLE, a steady light rain in which the drops are very minute (diameter less than $\frac{1}{16}$ in., approximately) and numerous. Such small drops seem almost to float in, and thereby to follow, even the slightest motions of the air. Drizzle is distinguished from sprinkles or ordinary light rain in that it falls from thick low lying stratus or strato cumulus clouds, rather than from cumulus or alto stratus, and always causes poor visibility. In theory the precipitation of drizzle is a consequence of turbulence produced by friction of the air with the ground, whereas other rain requires larger-scale vertical motions reaching higher levels in the atmosphere. Freezing drizzle causes glaze (or glazed frost), a thin, transparent ice crust on the ground and exposed objects, but frozen drizzle (or granular snow) consists of very fine snow or ice grains falling under identical circumstances as rain drizzle, except at cloud level temperatures at or below the freezing point. In the U.S., drizzle is sometimes confused with mist (q v)

DROBISCH, MORITZ WILHELM (1802-1896), German philosopher and mathematician, was born on Aug. 16, 1802, in Leipzig, where he became professor of mathematics in 1826, professor of philosophy in 1842, and where he died on Sept. 30, 1896. He regarded logic, whose business is the establishment of the general laws of thought, as a formal science independent of psychology. Religion was, for him, the expression of man's desire to escape from the impulses of nature to a divine being whose existence is better demonstrated by the ethical than the teleological proof. Drobisch's support of Johann Herbart appears in his *Beiträge zur Orientierung über Herbart's System der Philosophie* (1834) and in *Neue Darstellung der Logik* (1836). He also wrote *Grundrissen der Religionsphilosophie* (1840), *Empirische Psychologie* (1842), *Quaestionum mathematico-psychologicarum spec I-V* (1836-39) and *Über die mathematische Bestimmung der musikalischen Intervalle* (1846).

DROESHOUT, MARTIN (1601-c. 1650), engraver, baptized in London, was the son of Michel Droeshout and probably the pupil of his father and of his elder brother John, both engravers. Martin's title to fame is his engraved portrait of William Shakespeare (signed *Martin Droeshout sculpst*), which appeared in the first folio edition of Shakespeare's plays (1623). Since the engraver was only 15 years old at the time of Shakespeare's death, the portrait was not done from life. Martin Droeshout's later work is better. The British Museum *Catalogue of Engraved British Portraits Preserved in the Department*, vol. vi (1925) lists eight portraits engraved by Martin Droeshout.

DROGHEDA, municipal borough and seaport, on the southern border of Co. Louth, Ireland, on the River Boyne, about 4 mi. from its mouth in Drogheda bay, and 3½ mi. N by W from Dublin by rail. Pop. (1951), 16,773.

The earliest notices call the town Inver Colpa or the Port of Colpa, the present name signifies "The Bridge over the Ford." A synod was convened there in 1153 by the papal legate Cardinal Paparo, in 1224 there was founded a Dominican friary, of which there are still remains, and in 1228 the two divisions of the town received separate incorporation from Henry III. In 1412 Henry IV granted a charter authorizing the combination of the two towns in the reign of Edward III Drogheda was classed with Dublin, Waterford and Kilkenny as one of the four staple towns of Ireland. Richard II received in its Dominican friary the submissions of O'Neal,

O'Donnell and other chieftains of Ulster and Leinster. The right of coining money was bestowed on the town and several parliaments were held there, including one in 1495, when Poyning's law was enacted. In the civil wars of 1642 the place was besieged by Phelim O'Neill, but was relieved. In 1649 it was captured by Oliver Cromwell and the inhabitants brutally massacred. In 1690 it was garrisoned by King James's army, but after the battle of the Boyne it surrendered without a struggle. Drogheda ceased to be a parliamentary borough in 1885, and a county of itself in 1898.

From the close of the 17th century, and for some time after the Reformation, the primates of Ireland lived in Drogheda. Its proximity to Dublin, the seat of government and of the Irish parliament, induced them to prefer it to *Árdmacha inter Hibernicos*. Near Drogheda, in later times was the primate's castle and summer palace at Termonfeckin, some ruins of which remain.

The ancient fortifications of Drogheda have disappeared save that St. Lawrence gateway remains almost perfect, and there are ruins of the West, or Butler, gate. St. Peter's chapel formerly served as the cathedral of the modern Roman Catholic archbishopric of Armagh. In the town there was formerly an archiepiscopal palace, built about 1620, and the Dominicans, the Franciscans, the Augustinians, the Carmelites and the Knights of St. John had monastic establishments. Of the Dominican monastery (1224) there still exists the Magdalen tower, while of the Augustinian abbey of St. Mary d'Urso (1166) there are the tower and a pointed arch. There is a bluecoat school, founded about 1727, present buildings, 1870. The industrial establishments comprise cotton, flax and flour mills, sawmills, tanneries, salt and soapworks, breweries, chemical works, engineering works, and the big cement works, one of the largest of its kind in the world. The town is the headquarters of the valuable Boyne salmon fishery. A brisk sea trade is carried on in agricultural produce.

DROHOBYCZ, formerly a Polish town in the province of Lwow, capital of a district which contains the largest oilfield in Poland. Pop. (1931) 32,622. Oil was first found at Boryslaw and Tustanowice in 1904, and reached its highest production in 1909. Drohobycz has a factory of mineral oil, the largest oil refinery in Poland, and is connected by pipe lines with the chief wells. It also produces mineral gas, gasoline and ozokerite. Russian troops conquered Drohobycz in Sept. 1939 and it fell to Germany in 1941. It was incorporated into the USSR in 1945.

DROIT, a legal title, claim or due, a term used in English law in the phrase droits of admiralty, certain rights or perquisites assigned by the crown to the lord high admiral. (See also *WRECK*.) The most important of these in modern times consisted of ships and goods captured in port in time of war, others were *rotsam*, jetsam, ligan, treasure, deadend, derelict within the admiral's jurisdiction, all fines, forfeitures, ransoms, recognizances and pecuniary punishments, all sturgeons, whales, porpoises, dolphins, grampuses and such large fishes, with the share of some prizes—such shares being afterward called tenths, in imitation of the French, who gave their admiral a *droit de dixième*. The droits of admiralty were definitely surrendered to the crown by Prince George of Denmark, when lord high admiral of England in 1702. In prize law droits of admiralty are distinguished from droits of the crown, which, before 1914, were granted to the captain of ships and cargoes captured at sea by duly commissioned ships of war. (See H. C. Rothery, *Prize Droits*, being *A Report of J.M. Treasury on Droits of the Crown and of Admiralty in Time of War* [1915], also the *Law Quarterly Review*, vol. xxxix, p. 38, and the *Naval Prize Act*, 1918, also Holdsworth, *History of English Law*, vol. 1, pp. 559-561.)

The term droit is also used in various legal connections (for French law, see *FRENCH LAW*), such as the droit of advocacy (q v), the *droit d'achat* (right of pre-emption) in the case of contraband (q v), the feudal *droit de bris* (see *WRECK*), the *droit de régle*, or ancient royal privilege of claiming the revenues and patronage of a vacant bishopric, and the feudal droits of seigniorial personality.

DROIT ADMINISTRATIF. French administrative law may be described as that section of law which establishes the different administrative organs of the state and defines their powers as regards individuals. It will thus be noticed at once that there is a very close connection between French constitutional and administrative law since in the former the general plan of the operation of the powers inherent in the state is set out whereas in the latter the various organizations by which these powers are enforced are detailed, or—in another phrase—in constitutional law are to be found the principles whose application is enacted through the channels of administrative law.

France is for administrative purposes divided into "départements" which are subdivided into "arrondissements." The latter are again subdivided into "cantons" with a further subdivision into "communes." These different administrative divisions are

not, however, of equal importance. The "départements" and the "communes" are at the same time electoral constituencies, administrative units and so called "personnes morales". The "arrondissements" are neither "personnes morales" nor administrative units. The "lansons" are neither legal nor administrative units although they elect a councillor to the *conseil général* and to the *conseil d'arrondissement*. The "communes" form an administrative centre of great activity.

"Droit administratif" is, therefore, concerned with the general interests of the State, the regional interests of the "départements" and the local interests of the "communes," although for reasons of economy it is often enforced by the same agents as in the case of the "préfet" of a "département" who is at the same time an agent of the State and of the "département."

There are several classes of administrative organs, the authorities entrusted with the execution of administrative decisions ("préfets" and "sous-préfets"), mayors, deliberative councils, which must be subdivided into deliberative councils proper, namely, those who have power to take executive decisions (*conseil général*, *conseil d'arrondissement* and *conseil municipal*) and consulting councils (*conseil de préfecture*, *conseil d'Etat*), and finally administrative tribunals entrusted with jurisdiction.

The acts of administrative authority are fundamentally divided into two classes, acts of authority proper or, as they are sometimes called, unilateral administrative acts, by means of which the administration orders or prohibits some action by the subject of its administration, as for instance the order of a mayor prohibiting processions in the territory of his commune, and acts of administration proper by means of which the administrative authorities ensure the safeguard of the property of "personnes morales administratives" and enforce contracts, the nature of these acts being from a legal point of view the same as those of a private citizen. Appeals against acts of so-called authority proper are, however, within the jurisdiction of the administrative tribunals, whereas disputes arising out of acts of so called administration proper are tried before the ordinary judicial tribunals.

Acts of authority proper are subdivided into "actes individuels" and "actes réglementaires." "Actes individuels" are those concerning a particular individual in connection with a defined object. "Actes réglementaires" are those by which the administrative authority imposes certain restrictions on a body of individuals. The right to do "actes réglementaires" is entrusted as regards the whole State to the president of the republic, as regards the "départements" to the "préfets" and as regards the "communes" to the mayors. This subdivision of acts of authority proper is important as regards jurisdiction, for only "actes individuels" can be appealed against before the ordinary administrative tribunals. The sole means of attacking an "acte réglementaire" is before the *conseil d'Etat* which may order it to be cancelled as *ultra vires*.

Private individuals are protected against officials by their power of prosecution before the Criminal Courts in certain cases (Art. 166-195, Crim. Code) and their right of bringing an action before the ordinary judicial tribunals where an official is personally liable, as the responsible for acts done by an official only assured by the administrator in cases where the fault is inherent in the service, and finally by appeal to the administrative tribunals.

It is true that in case of tort French citizens can only sue officials of the State in their official capacity in the ordinary courts when the act complained of is alleged to have been committed "with malice," and that in the absence of "malice" the private citizen must seek his remedy before an administrative tribunal. It is, however, interesting to compare generally the rights of French citizens with those of British subjects who, in dealing with State officials or civil servants, find that he is, in many cases, powerless owing to the immunity these persons enjoy in regard to the consequences of acts done in their official capacity. French Administrative Law may be said to be based on the recognition of the fact that the State, regarded as a "personne morale," has two distinct entities, and that in its public capacity it is a "person" who is responsible for the torts of its servants as well as for contracts made by them or its officials and that consequently it may be sued, if not in the ordinary courts, before the administrative

tribunal whose existence consequently constitutes a protection for the subject against arbitrary decisions of individuals acting officially, whereas English jurisprudence, as already stated, regards acts done by officials or servants of the Crown still on the mediaeval assumption that as "the king can do no wrong" and "the State is the king," it is not responsible for the torts of its servants. This comparison between the English and French system of jurisprudence may be further emphasized by a consideration of the fact that the French administrative tribunals are real tribunals, acting independently of the executive, whose functions and powers are defined in the *Code Administratif*, whereas under the English rule of law Government departments often exercise *in camera*, and without an oral hearing of the applicant, semi-judicial functions under Statutory Powers which, in practice, confer on them the power of judging their own cause without appeal.

Only cases in which a definite right has been violated can be heard before the administrative tribunals, where private interests only are concerned appeal can be made only to representatives of the administration, following the hierarchical order upwards. As regards the cases which come before the administrative tribunals these are divided into four classes: first, those in which the tribunal examines the matter as regards both law and fact, and decides if a decision is to be upheld or replaced by another; secondly, those in which the tribunal has to decide if any administrative act was *ultra vires*, in which case it quashes the decision; thirdly, those in which the tribunal is called upon to interpret the scope and intention of an administrative act; and, fourthly, those in which the tribunal has power to impose a penalty in cases where public property has been encroached upon, or a legal usufruct of public utility unobserved. It must be noticed that this last class of case constitutes an infraction of the rule that every illegal act of any kind, the commission of which entails a penalty, falls within the provisions of the Penal Code and must be tried before the ordinary judicial tribunals.

The fundamental principle of the separation of the judicial and administrative authorities was enacted by the law of Aug. 24, 1790, sec. 2 Art. 13 which enacts that the judges may not in any way interfere with the operations of the administrative corps, or summon before them administrators to answer for acts done in carrying out their proper duties. This principle has been so far developed that if during the course of an action before the ordinary judicial tribunals a question arises which might prejudice a decision of the administrative tribunals, the hearing must be suspended pending a decision by the latter. In cases, however, of "expropriation" on grounds of public utility, in which a decision must be given by the judicial tribunal, the latter may refuse to make an order if all the legal formalities required have not been duly carried out by the administrative authorities.

Finally certain matters which should, according to their nature, be brought before the judicial tribunals have by law been allotted to administrative tribunals, e.g., questions arising out of the contracting for public works, the sale of any part of the national domain and the declaration of the State as a debtor.

Administrative tribunals are divided into tribunals of first instance and those of appeal. The mayor and the council of the prefecture always constitute tribunals of first instance. The "préfets" and the competent minister constitute sometimes tribunals of first instance and sometimes tribunals of appeal. The *conseil d'Etat* is in principle an appeal tribunal, although in certain cases it is a court of first and last instance, and even a court of cassation. The *cour des comptes* except in one instance is a court of first and last instance. These tribunals are also subdivided into tribunals competent to hear and determine all matters which have not been specially reserved, and special tribunals for the trial of the latter class of cases.

Ordinary tribunals are in the first instance that of the competent minister and in the second instance the *conseil d'Etat*. Special tribunals for the hearing of general cases are the council of the prefecture, the "préfet," the "sub préfet" and the mayor.

Special tribunals with special functions are those of the *cour des comptes*, the maritime prefects, the council of public instruction, the tribunals with jurisdiction concerning the issue of coinage,

that of the sanitary police, that for excess values and that for the colonies

Administrative judges are removable, with the exception of those of the *cour des comptes* (F No)

DROITWICH, market town and municipal borough, Evesham parliamentary division, Worcestershire, England, 5½ mi NNE of Worcester, and 126 mi NW from London by the GWR, but served also by the LMSR. Pop (1938) 4,662. Area 2.7 sq mi. It stands on the river Salwarpe, a tributary of the Severn, being connected with the latter by canal. There are three parish churches, St Andrew, St Peter and St Michael, of which the first two are fine old buildings in mixed styles. The principal occupation is the manufacture of the salt obtained from the brine springs or *wyches*, to which the town probably owes its name and origin. The springs also give Droitwich a considerable reputation as a health resort. There are Royal Brine Baths (with a clinic), St Andrew's baths and a private bath hospital. Because of the pumping of the brine there is a continual subsidence of the ground, detrimental to the buildings, and new houses are mostly built in the suburbs. In the pleasant well wooded district surrounding Droitwich the most noteworthy points are Hindlip hall, 3 mi S, where (in a former mansion) conspirators in the Gun powder plot defied search for eight days (1605), and Westwood, a fine hall of Elizabethan and Carolean date on the site of a Benedictine nunnery, 1 mi W of Droitwich, which offered a retreat to many royalists during the commonwealth.

A Roman villa, with various relics, has been discovered there, but it is doubtful how far the Romans made use of the brine springs, which are also mentioned in several charters before the conquest. At the time of the Domesday survey all the salt springs belonged to the king, who received a yearly farm of £65, but the manor was divided between several churches and tenants in chief. The burgesses of Droitwich (*Wic, Saluue, Wich, Drightwich*) are mentioned in the Domesday survey. The town is first called a "burgus" in the pipe roll of 1155-56, but the burgesses did not receive their first charter until 1215, when King John demanded a fee farm of £100. The payment of the fee farm gradually lapsed in the 18th century. In mediaeval times Droitwich was governed by 2 bailiffs and 12 jurats. Queen Mary granted the incorporation charter in 1553-54 under the name of the bailiffs and burgesses. James I in 1625 granted fuller charter, which remained the governing charter until the Municipal Reform act. King John's charter granted the burgesses a fair on May 9, to last for eight days, but Edward III in 1330 granted instead two fairs, on Dec 29 and Oct 28 and three days after. Queen Mary granted three new fairs. In recent times fairs were held in June and December, but these have lapsed and now none is held. James I changed the market day from Monday to Friday.

DRÔME, a department of southeast France, formed of parts of Dauphiné and Provence, and bounded on the west by the Rhône, which separates it from Ardèche, north and northeast by Isère, east by Hautes-Alpes, southeast by Basses-Alpes and south by Vaucluse, area 2,533 sq mi, pop (1936) 267,281. Drôme is watered by tributaries of the Rhône, including the Isère in the north, the Drôme in the centre and the Aygues in the south, flowing from spurs of the Alps westward to the alluvial plains on the left bank of the Rhône. North of the Drôme lie the Vercors and the Royans, a region of forest clad north-to-south ridges. South of that river the mountain system is intersected everywhere by torrents. In the east of the department the mountains of the Dévoluy reach 7,890 ft. North of the Isère a district of low hills stretches to the limits of the department on the Vallouire, its most productive portion. The climate, except in the valleys bordering the Rhône, is cold, and winds blow incessantly. Snow lies on the mountaintops during the greater part of the year.

The agriculture of the department is moderately prosperous. The main crops are wheat, grown chiefly on the banks of the Isère and Rhône, oats and potatoes. Large flocks of sheep feed on the pastures in the south; cattle raising is carried on principally in the northeast. Good wines, among which the famous Hermitage growth ranks first, are grown on the hills and plains near the

Rhône and Drôme. Fruit culture is much practised. Olives and figs are grown in the south, the cultivation of mulberries and walnuts is more widely spread. The rearing of silkworms in Drôme is very important. The Montélimar district is noted for its truffles. Mineral products include lignite, blende, galena, calamine, freestone, lime, cement, potter's clay and kaolin. Brick and tile works, potteries and porcelain manufactories exist in several localities. Industries comprise flour milling, distilling, wool sawing, turnery and dyeing. The chief textile industry is the preparation and weaving of silk, which is carried on in a number of towns. Woolen and cotton goods are also manufactured. Leather working and bootmaking, carried on on a large scale at Romans, are important, also the manufacture of machinery, hats, confectionery and paper. Drôme exports fruit, nuts, oil, cheese, wine, wool, livestock and its manufactured articles, the chief import is coal. It is served by the Paris Lyon railway, and the Rhône and Isère furnish more than 100 mi of navigable waterway. The canal de la Bourne, the only one in the department, is used for purposes of irrigation only. Drôme is divided into the arrondissements of Valence, Die, Montélimar and Nyons, comprising 29 cantons and 378 communes. The capital of the department of Drôme is Valence, the seat of a bishopric of the province of Avignon. The department forms part of the *académie* (educational division) of Grenoble, where its court of appeal is also located, and of the region of the 14th army corps (Lyons). Besides Valence, the chief towns of the department are Die, Montélimar, Crest and Romans. Nyons is a small industrial town with a mediaeval bridge and remains of ramparts. Suse la-Rousse is dominated by a fine château with fortifications of the 12th and 14th centuries, in the interior the buildings are in the Renaissance style. At St Donat there are remains of the palace of the kings of cisjurian Burgundy, though little of the building is earlier than the 12th century, it is the oldest example of civil architecture in France. The churches of Leoncel, St Restitut and La Garde-Adhémar, all of Romanesque architecture, are also of antiquarian interest. St Paul Trois Châteaux, an old Roman town, once the seat of a bishopric, has a Romanesque cathedral. At Grignan there are remains of the Renaissance château where Madame de Sévigné died. At Tain there is a sacrificial altar of AD 184.

DROMEDARY, a name properly used for the swift, riding breed of camel, belonging to the Arabian (one-humped) species. A dromedary has been known to carry a man 115 mi in less than 11 hr. (See CAMEL)

DROMICEIIDAE see EMU

DROMORE, a market town and urban district of Co. Down, N. Ire, on the Upper Lagan, 17½ mi SW of Belfast by rail. Pop (1937) 2,176. Area 262 ac. The bishopric there grew out of an abbey of Canons Regular attributed to St Colman in the 6th century, and was united in 1842 to Down and Connor. The town and cathedral were wholly destroyed during the insurrection of 1641, and the present church was built by Bishop Jeremy Taylor in 1661. Remains of a castle and earthworks are to be seen, together with a large rath, or encampment, known as the Great Fort. The town gives its name to a Roman Catholic diocese. Manufacture of linen is the chief industry.

DROMOS, the open air passage, enclosed between stone walls, leading down to the entrance of Greek "beehive" tombs.

DRONE, in music, the bass pipe or pipes of instruments of the bagpipe type, having no lateral holes and therefore giving out the same note without intermission as long as there is wind in the bag, thus forming a continuous pedal, or drone bass. The drone pipe has, instead of a mouthpiece, a socket fitted with a beating reed, and inserted into a stock or short pipe immovably fixed in an aperture of the bag. The Greek classics allude to the existence of a pipe with a drone, either of the arghol or the bagpipe type.

DRONFIELD, a town and urban district of Derbyshire, England, 6 mi S of Sheffield, on the LMS railway. Pop (est. 1938) 6,609. Area 5.4 sq mi. It is on the river Drona, a tributary of the Rother. There are extensive foundries. Spades, shovels, reaping hooks, sickles and scythes are made. Coal is mined in the neighbourhood. The church of St John the Baptist, with a lofty spire, is a good example of Decorated work, with

Perpendicular additions

DRONGO, any of about 20 species of old world passerine birds, also known as king crows or drongo shrikes, forming the family Dicruridae, related to the old world orioles. They are handsome, fork tailed, usually black and 10 to 12 in. long, but the prolonged outer tail feathers sometimes double that length. They are commonest in southeastern Asia, but also occur in Africa, Malaysia and Australia. The drongo cuckoo of India (*Bucconulus lugubris*) resembles or mimics the common drongo (*Buchanga atra*) and lays its eggs in the drongo's nest. (G F Ss)

DROP FORGING Drop forging is the production in quantity of articles in metal by means of a falling weight forcing the heated material into a die.

Since the beginning of the 20th century development has taken place owing to the growth of the motor industry and the increasing demand for mechanical transport. A large number of the parts of an automobile are now drop forged, e.g., the engine crankshaft, connecting rods, bearing caps, tappets, rockers, valves, flywheels, gears, actuating forks, couplings, levers and lever brackets. On the chassis, the front axles, back axle casings, swivels, stub axles, wheel hubs, steering levers, brake levers, pedal levers and plates, differential gears and pinions, brake shoes and brackets are all

Drop forging is essentially a moulding operation, the metal being worked with the aid of machines at a sufficient heat to bring it to a plastic condition, but never to the molten condition necessary for the production of castings. Drop forged articles are frequently confused with castings, but the manufacturing process is entirely different.

The hammer used in drop forging operations consists of a forged or cast block of steel, commonly called the "tup" and weighing

FIG. 2.—DROP FORGED ROD BEFORE AND AFTER FLASH HAS BEEN REMOVED.

When the metal is being forged a certain amount known as the flash is pressed out at junction of dies (upper figure). It is removed by trimming tools, and the finished forging is then ready for machining (lower figure).

anything from 1 cwt. to 3 or 4 tons, which is lifted to a height and then allowed to fall or "drop" on to the anvil block by its own weight. The fall is controlled by guide rods or slides bolted to, or fixed in, the anvil block. The lifting apparatus varies in detail, but in its essentials consists of pulleys exerting a variable friction pull on a belt connected with the tup, manipulated with cords or levers usually by hand (fig. 1). The hammers mostly used in Great Britain are those delivering a gravitation blow by a falling weight impinging on an unyielding anvil, but steam hammers are also used, where the tup is attached to a piston rod and propelled downwards and lifted up by means of steam or compressed air. The anvil receives the whole of the energy delivered by the hammer whenever a blow is struck except the small amount absorbed in compressing the stamping, and therefore the ratio of the weight of the hammer to the weight of the anvil block is of great importance, a minimum ratio of 15 to 1 is usual, i.e., a 1 ton hammer will have a 15 ton anvil block and so on.

Die Block.—For the manufacture of a drop forged article, impressions are sunk in two die blocks to the exact shape and size of the pattern required. Careful attention is paid to the cutting of these dies which are frequently of a very intricate pattern, very expensive steel is usually employed and highly skilled workmen are engaged. One die is fixed in the tup and the other is fixed on to the anvil block by means of poppet pins or keys, the metal to be forged, which has previously been heated in an adjacent furnace to a malleable condition, is placed between these dies, and several blows in quick succession are struck by the hammer, thus forcing the metal evenly into the die impressions. The number of blows required must be gauged with some accuracy by the stamper, too few blows will not obtain uniform strength in the forging, while too many will shorten the life of the dies. A certain quantity of metal is extruded at the point where the two dies meet, and this surplus metal, called the "flash" or "fin," is removed on completion of the forging operation by means of a pair of trimming tools fixed in a press, one of these tools resembles the pattern of the article required and the other is made hollow to the outline of the pattern at the point of the flash (fig. 2). The forging, placed in the press, is forced through the hollow tool by the solid one and the flash is cut off, the forging being subsequently returned to the hammer for one more blow to correct any possible distortion or bending which may have taken place during the trimming operation.

FIG. 1.—DIAGRAM OF TYPICAL DROP HAMMER WITH STEAM LIFTER. Weighing anything from 1 cwt. to 4 tons the anvil being at least 15 times as heavy, the hammer or "tup" is raised by lifting arms operated by steam power. Guide rods fixed in the anvil control its fall.

made by this method, even small articles such as wind screen pillars, wing-nuts and stainless door handles being made under the drop hammer. The development of aviation finds much employment for drop forging in connection with propeller hubs, crank shafts, connecting rods, valves, brackets, gears, etc. Great accuracy is demanded for this work, both for weight and strength, very fine limits are imposed and the forgings are subjected to severe tests by the Aeronautical Inspection Directorate. Many other industries use drop forged articles, common products being scissor blanks, surgical instruments and heavy gears for railway work.

DROP-FORGING HAMMERS AND TRIMMING PRESSES

- 1 Trip hammer forger a substitute for sledge hammer
- 2 Board drop hammer lifts by power drops by gravity
- 3 and 4 Trimming presses 3 hot trimming 4 cold trimming
- 5 Steam drop hammer force of each blow under direct control of operator

On the completion of the forging operation, the forgings are usually subjected to heat treatment to relieve the metal of any strains set up during stamping and also to render it most suitable for machining operations should these be required. Heat treatment is an integral part of the manufacture and is carried out by highly experienced workmen, perfect control and knowledge of temperature is vital, as the necessary strength and hardness can only be obtained if the treatment is correct.

All wrought metals have in a marked degree "grain" or "fibre" and great care has to be taken in forging to see that the grain is worked into a position parallel to the principal stresses likely to occur in the article to be forged. Grain must never be allowed to run transversely to the axis of the greatest bending stress (fig. 3). This is one of the great advantages of drop forgings over castings. In a casting, where the metal is melted down and poured into a mould, the structure becomes crystalline and not fibrous, but in a drop forging, always made from bars or billets which have the grain running longitudinally, very careful attention is paid to the disposition of this grain, so that if there is a bending stress it goes across the longitudinal grain and not between it.

Drop forgings are made in many metals, besides the various alloy steels, stainless steels and iron, brass, yellow metal, cupro nickel, aluminum, duralumin, magnesium, etc., are used. Considerable progress has been made with the forging of these light alloys. Some of them are exceedingly difficult to forge, and the greatest accuracy in gauging the forging temperatures is required (K. R. C.)

IN THE UNITED STATES

Drop forging is divided into four classes, dependent on the type of machine used. They are: (1) trip hammer forging, (2) drop hammer forging, (3) upsetting, and (4) press forging.

Trip hammer forging is done with a power driven sledge hammer so arranged that successive blows strike in exactly the same place. The helve type of trip hammer consists of (1) a base or anvil on which there is held a die, and (2) an arm or helve fixed at one end, the other end of which is mechanically raised and lowered. On the moving end of the helve there is fastened a second die which strikes against the die held on the anvil. Another type of helve hammer makes use of an auxiliary ram between the helve and the upper die. The ram operates between vertical guides and is loosely connected to the helve. The advantages of a trip hammer are the rapidity with which it delivers its blows and the ease with which the operator can instantly change the force of the blow from zero to the maximum of the machine. Typical examples of the type of forgings made by this process are the various types of chisels, punches and picks.

Drop hammer forging is that branch of the forging industry which utilizes a machine called a drop hammer. A drop hammer consists of a base, a hammer or ram which strikes the base and which travels vertically between side guides, and the overhead mechanism for lifting the hammer and releasing it. In the board drop hammer a board, generally of maple, raises the ram. The lower end of the board is fastened to the upper portion of the ram and the upper end of the board travels between two rolls which revolve in opposite directions. Automatic mechanism is provided so that the rolls alternately squeeze the board and, revolving, lift it. The rolls are then spread apart, allowing the ram to fall. The steam drop hammer (Plate 1, fig. 5) utilizes a steam cylinder for the lifting mechanism, the piston rod taking the place of the board and the ram being fastened to the lower end of the piston rod. The air drop hammer is fundamentally the same as the steam hammer, but uses compressed air instead of steam.

For forging with the drop hammer there is used a set of tools known as cutting dies, which are blocks of steel used in pairs. The dies are cut or dug out so that when the two cut-out blocks are put face to face, the hollow included between them has the exact shape of the forging which they are designed to produce.

FIG. 3.—DROP FORGED CRANK SHAFT SHOWING GRAIN ARRANGED TO FOLLOW CONTOUR OF CRANK SHAFT

One of the dies is solidly fastened to the base or anvil, while the other is fastened to the lower end of the ram. The overhead mechanism of a drop hammer is automatic. The hammer travels to the top of its stroke and is released, causing the die block fastened to it to strike against the one on the base, after which the ram is instantly raised. The operation of drop forging consists of heating any suitable metal to a temperature at which it is malleable, placing it on the lower die block and allowing the upper die block to fall on it repeatedly, forcing the metal into the shape defined by the sunk or cut out portion of the dies. The making of drop forgings can be considered as divided into (1) the making of the dies and (2) the production of the forgings.

Die Making.—In making dies it must be remembered that it is not possible to forge all shapes. No hole or depression in a drop forging may be larger at the bottom than at the top, although it may be smaller. In actual practice it must be slightly smaller by an amount equal to the "draft," as the angle at the side of every depression is called. No surface of a drop forging may be parallel to the path of travel of the dies, but must depart from parallelism by an amount not less than the draft angle and in the direction which will make all parts of the forging smaller at the bottom of the impression in each die than at the top. The usual draft angle in drop forging is 7° .

It is possible to forge many different kinds of materials, among them being iron, copper, certain of the brasses, bronze, aluminum, monel metal, nickel and a great number of alloys of these and similar metals. By far the greatest number of forgings are made from steel and its alloys. Typical examples are wrenches, pliers, chisels, hammers, parts of machines of all kinds and automobile connecting rods, crank shafts, manifold flanges and clevis bolts. The die design is influenced by the quantity which is to be made at one setting of the dies as well as by the quantity eventually wanted. Dies may be so designed as to make two or more forgings at once, later to be cut apart by trimming. Since metal is forged while hot and shrinks in cooling, that fact must be allowed for when making dies. All forging dies are made larger than the size which the piece is to be when cold, by an amount equal to the shrinkage. The cutting of the dies proceeds in several stages, each designed to the end that the final or finishing stage will produce the exact forging wanted.

After the finishing cut is made and the impression is completed the accuracy of the work is tested by placing the two die blocks face to face and pouring melted lead into the impression and allowing it to harden, afterwards, this lead cast which has the shape of the desired forging is examined. The quantity of forgings which one pair of dies will produce varies from perhaps 100 pieces under the worst to perhaps 500,000 under the best conditions. The normal life for steel pieces lies between 10,000 and 40,000.

Upsetting is done with a drop hammer by making a hole in the bottom die and placing in the hole a bar longer than the depth of the hole and allowing the upper die to strike it. This must leave the end. When it is desired to have an upset other than at the end of the bar the lower die may be designed in two halves so that one may be removed and the forging taken out. Special machines embodying these principles are called upsetters, bulldozers or forging machines. In the operation of such a machine a bar is heated and placed in the opening between the two halves of a pair of gripping dies, one of which may be fixed or both may be movable. The two halves of the die come together tightly gripping the bar and then the ram is forced against the end, upsetting it and also forcing the metal to fill any shaped impression which may be in the gripping dies. The ram then returns and the gripping dies open for the operator to remove the piece.

Press forgings are made in toggle joint or hydraulic presses using dies in the same general manner as in the drop hammer method, the difference being that a slow push is used instead of the quick, heavy blow of a ram. Presses are also used for sizing forgings, taking the place of cold striking in a drop hammer. (See PRESSES AND PRESSWORK.) (H. K.)

DROPSY, the name given to a collection of fluid in all or any of the tissues or cavities of the body. Dropsy is the extreme of oedema which signifies any condition causing any cell, any

tissue or the whole organism to hold more water than is normal. Oedema may be localized and limited in extent as after a bee sting or in hives, or generalized as in heart disease. Hydrothorax is an accumulation of fluid in one or both pleural cavities. Excessive fluid in the sac surrounding the heart is designated hydropericardium, in the peritoneal cavity, ascites, when universally distributed anasarca. In the last instance, free fluid may appear within the tissues themselves.

Dropsy is a symptom and not a specific disease, essentially it is an excess of water contained in any of the tissues or in the spaces surrounding them. Usually water passes into and out of cells so that equilibrium is maintained. They neither swell nor shrink but keep their volume, thus the adult organism does not change its weight materially. Oedema begins with an accumulation of water within the cells. While originally limited to them, oedema when excessive or long continued leads to a liquefaction which squeezes off their more fluid portion into any pre-existent or artificially created adjacent spaces. This liquid between cells is frequently referred to as lymph by physiologists, the pathologists call it intercellular, or interstitial, fluid, or a transudate. Its chemical composition is akin to that of lymph or blood plasma except that it has a lower concentration of albuminous bodies. An exudate is primarily a transudate but differs therefrom in that the products of inflammation are added to it. An exudate is a transudate plus the products of cellular destruction, if many white blood corpuscles collect and die in the injured area, the result is pus. An exudate is always higher in albuminous concentration than a transudate, frequently exceeding even the normal of blood plasma. The specific gravity of a transudate ranges between 1.008 and 1.018, that of an exudate averages higher. The mineral salts present in either are like and in about the same proportion as those in blood. The quantity of albumin varies only as its source is of a noninflammatory or an inflammatory origin. Oedema fluid is colourless, but if red blood corpuscles are destroyed in its manufacture it may be tinged green or red. Bile makes it distinctly yellow.

Dropsy is erroneously attributed to purely mechanical causes, specifically to anything that raises intracapillary blood pressure. This may be brought about through obstruction of the venous channels of a limb or part by thrombosis or scarring or by direct pressure of a tumour or an aneurysm upon a vein, thus causing a retardation of blood outflow, with congestion and stagnation of blood therein.

Oedema is common in heart disease when the efficiency of the circulation is reduced. Lack of muscular force or leakage through valvular defect retards cardiac output and/or impedes the return of blood into the heart. Oedema follows because obstruction to either venous outflow or arterial inflow leads to identical effect. A lowering or a heightening of blood pressure in the capillaries is equally effective in producing oedema of corresponding intensity. This disproves the belief that increased intracapillary pressure *per se* causes oedema. The chemical consequences of a defective circulation make for oedema and are identical whether the inflow or the outflow of blood to the part is impeded.

Every circulation lack leads to (1) inadequate removal of metabolites such as carbonic acid from the stricken part and/or (2) a lack of oxygen in it, which increases the accumulation of acid (lactic, chiefly). Since experiment proves that any tissue mass (a kidney, a liver, a muscle) swells equally, whether its vein or its artery be tied off, the conclusion is inevitable that oedema is not the result of more water being pushed into the area but that, because of the chemical change, it sucks water into itself from any available source.

The problem of oedema is part of a greater biological question, why do tissues hold water at all and why normally an almost constant amount? The whole organism or any piece of it is like so much gelatin which when placed in water takes up a certain amount. Chemically gelatin is protein and therefore like the main constituent of all living matter. Technically, it is a water-absorbing colloid, the degree of its "hydrophilia" depends upon conditions surrounding it and its chemical composition. When the neutral granules of ordinary gelatin are slightly acidified, their

capacity to swell with water is increased enormously. The change is similar to that in disease—oedema develops whenever the protein colloids of a tissue, after circulatory breakdown, accumulate acid, thus to increase their imbibition capacity.

The development of oedema in heart disease has the following sequence. Oedema first manifests itself in the most dependent tissues, most commonly therefore in the feet, which are farthest from the heart and so from the source of arterialized blood. The lack of circulation to these distal parts results in an accumulation of acids which, acting upon the contained proteins, raises their affinity for water to produce oedema. As cardiac and circulatory efficiency sinks, body levels nearer the heart become involved, and the legs, abdominal viscera and brain swell. Finally the blood supply from the bronchial arteries to the lung itself fails, and the patient succumbs with pulmonary oedema.

This increase in acid present in a tissue is mainly responsible for its oedematous state, though other materials (chiefly nitrogen compounds such as pyridine or "poisonous" amines now believed to be the essence of the toxins of the infectious diseases) not acid in character accomplish a similar end. Every such cause for oedema represents a tissue reaction which evokes greater hydrophilia and fluid accumulation.

This fact that the affected part sucks more water into itself from any contiguous source is fundamental to the understanding of the oedema of kidney disease. The oedema of kidney disease is the commonest expression of dropsy, and that from kidney disease ranks second, it tends to appear first in the loose cellular tissues surrounding the eyes, the whole face may puff and the accumulation of fluid may spread to all the tissues, increasing the body weight as much as does the anasarca of severe heart disease. When unassociated with blood pressure rise, dropsy has been declared the product of an "increased permeability of the capillaries to water." This statement is meaningless, as generalized oedema accompanies only certain kinds of kidney disease, it does not appear in the chronic interstitial nephritis of Bright, but in the subacute, acute, glomerular, generalized and toxic types of the nephritides. The theory that failure of kidney function is followed by body oedema is cancelled by the fact that destruction of all kidney function is not followed by oedema. Neither clinical nor experimental evidence supports the conclusion that the failure of urinary secretion engenders a backing up of excrementitious materials in the blood (uraemia) to become the cause of the stupor, coma, convulsions and death which may appear as the concomitants of kidney ailment. The destruction of one or both kidneys in man or experimental removal in animals is not followed by either body oedema or the clinical expressions of uraemia. On the other hand, most diverse "kidney" poisons (uranium, mercury, lead) reduce in human beings or animals the secretion of urine with such as is excreted filled with kidney casts and albumin (the diagnostic marks of nephritis), and a severe generalized oedema appears. This proves that the body oedema is not secondary to kidney malfunction but identical with it. That is, the active poison makes not only the kidney but all the body tissues swell. When this affects the brain, stupor, coma and convulsions supervene.

Oedema of the brain is also caused by many other noxious agents. The sleep and coma of the dying cardiac patient are caused by oedema of the brain, so are the coma of a diabetic, the convulsions of one in delirium tremens and the stupor of a person with a severe head injury. An alcoholic is poisoned with alcohol, a diabetic with acetone, and the first and last named with (lactic) acid.

The poisonings which simultaneously lead to oedema in a kidney and in the rest of the body are paralleled by poisoning by the toxins of the infectious diseases. Scarlet fever, streptococcal infection, pneumonia, diphtheria, typhoid fever and even tuberculosis are examples. In all these instances diffusible poisons elaborated in an initial seat of infection such as the throat, the alimentary tract or the skin are carried via the blood into all the tissues, or the microorganisms responsible break into the circulation to land in any of the more peripherally located tissues and set up a more localized but identical type of intoxication.

The oedema of heat disease or that of kidney breakdown appears too in localized form. Peripheral obstruction to venous outflow (phlebitis, as in milk leg) or to arterial inflow (arteritis or degenerative blood vessel disease) is followed by oedema, which produces the picture of moist or dry gangrene as it affects a toe, a foot or a leg. Characteristic localized oedemas result from embolic (foreign particles carried in the blood) infections, which may cause the oedemas and dropsies characteristic of all the inflammations (joint, muscle and heart rheumatism, nephritis, cystitis, appendicitis, gall bladder disease and a dozen types of nervous disease from peripheral neuritis through spinal cord disease to encephalitis and cerebritis).

Epidemic dropsy was long among the medical unknowns. The first recorded outbreak occurred in Calcutta in 1877. It disappeared during the hot weather of the following year, but recurred over a wider area in the cold months of 1878-79 and 1879-80. In 1902 an outbreak, in which nearly one third of the cases died, occurred in the Barisal jail, Bengal. In this epidemic, dropsy affected the lower limbs first, trunk and upper limbs later in severe cases, the face very rarely. It was accompanied by gastroenteritis, deep seated pains in limbs and body and burning and pricking of the skin. Various rashes appeared early in the attack, while eczema, desquamation and even ulceration supervened. Anaemia was marked, giving rise in Mauritius to the name "acute anaemic dropsy." The duration of the disease varied, lasting from three weeks to three months. Fever was uncommon. Death was often sudden, caused chiefly by cardiac and respiratory failure. There is reason to suppose that this disorder is identical with oriental beriberi, with so called pellagra and with what became known as war or starvation oedema. The signs and symptoms, though aggravated by anaemia and infection, originate in an alteration of the chemistry of the tissues caused by bad nutrition. The food intake is quantitatively and/or qualitatively insufficient, especially in protein and vitamins. The starved fail to build blood, and fall easier prey to infection and fever.

The treatment of dropsy consists of removal of the primary cause (a strengthening of cardiac activity or the control of infection). Symptomatic relief may call for tapping of the abdomen or puncture of the legs in severe cases. Milder measures rely upon cardiac stimulants and schemes to dehydrate swollen tissue colloids such as the administration of alkalis and purgatives, diaphoretic and diuretic salts (which owe their virtue to a primary dehydrating effect upon the body tissues with the water thus set free being eliminated through the bowel, skin or kidney).

See Martin H. Fischer, *Oedema and Nephritis*, 3rd ed. (1921) (M H F)

DROPPORT, in botany, the common name for *Pulipendula ulmaria* (family Rosaceae), found in dry pastures. It is a perennial herb, with much divided, radical leaves and an erect stem, 2 to 3 ft. high bearing a loose terminal inflorescence of small white flowers. The dropport is a native of Europe and Asia, introduced in North America.

Water dropport, *Oenanthe crocata* (family Umbelliferae), is a tall, herbaceous plant growing in marshes and ditches. The stem, which springs from a cluster of thickened roots, is stout, branched, hollow and 2 to 5 ft. high, the leaves are large and pinnately divided, and the flowers are borne in a compound umbel, the long rays bearing dense, partial umbels of small white flowers. The plant, which is very poisonous, is often mistaken for celery.

DROSERACEAE, a family of dicotyledonous plants, remarkable in that all its members are insectivorous. There are four genera and about 90 species. *Drosera*, a cosmopolitan genus including about 85 species, has three British and seven North American representatives, known as sundews (*q.v.*) *Dionaea*, with a single species, is Venus's-fly trap (*q.v.*) *Aldrovanda*, also with only one species, is a water plant, lacking roots.

DROSOPHILA, a genus of flies (see DIPTERA). Several species, and in particular the fruit fly, *D. melanogaster*, have become widely known because of their extensive use in the study of heredity. Because of their large chromosomes, their short life cycle and the ease with which they can be raised they are admirably suited for this study. Some species develop in unclean

milk bottles, the pupal cases being very difficult to remove because of the dried secretions holding them to the glass. (See GENETICS, HEREDITY) (C J CN)

DROSOPHYLLUM A genus, allied to the sundews (*Drosera*). It is a low, shrubby plant which, in contrast with other

FROM LLOYD, THE CARNIVOROUS PLANTS (TROPICUS BUNARIA CO.)

DROSOPHYLLUM SMALL PORTION OF A LEAF SHOWING THE TWO KINDS OF GLANDS STALKED AND SESSILE

in Portugal is "slobbering pine" or "dew of the sun" (sundew). According to a statement transmitted by Darwin, the peasants hang bunches up in their kitchens, etc., to act as flypapers.

DROSTE-HULSHOFF, ANNETTE ELISABETH, FREIN (1797-1848), German poet, was born at the family seat of Hulshoff near Münster in Westphalia on Jan. 10, 1797. Her early mental training was largely influenced by her cousin, von Droste zu Vischering, archbishop of Cologne, and she received a liberal education. After prolonged visits among the intellectual circles at Coblenz, Bonn and Cologne she retired to the estate of Ruschhaus near Münster, belonging to her mother's family. In 1841, owing to delicate health, she went to reside in the house of her brother-in-law, the well known scholar, Joseph, Freiherr von Lassberg (1770-1845), at Schloss Meersburg on the lake of Constance, where she met Levin Schücking, and there she died on May 24, 1848. Annette von Droste-Hulshoff is, beyond doubt, the most gifted and original of German women poets. Her verse is strong and vigorous, but often unmusical even to harshness, one looks in vain for a touch of sentimentality or melting sweetness in it. As a lyric poet she is at her best when she is able to attune her thoughts to the sober landscape of the Westphalian moorlands of her home. Her narrative poetry, and especially *Das Hospiz auf dem Grossen St. Bernard* and *Die Schlacht im Loener Bruch* (both 1838), belongs to the best German poetry of its kind. She was a strict Roman Catholic, and her religious poems, published in 1832, after her death, under the title *Das feistliche Jahr, nebst einem Anhang religiöser Gedichte*, enjoyed great popularity.

Annette von Droste-Hulshoff's *Gedichte* were first published in 1844 during her lifetime. Collected editions of her works were edited by E. von Droste-Hulshoff (Münster, 1886). The *Ausgewählte Gedichte* were edited by W. von Scholz (Leipzig, 1902). See, among the many monographs on Annette von Droste-Hulshoff, those by Levin Schücking (2nd ed., Hanover, 1871), by H. Hueffer (Gotha, 1871, 3rd ed. by Cardauns, 1911), Gabriel Reuter (1905), and A. Balchenhoff (1916). For her correspondence see the *Samtliche Briefe* (edit. Cardauns, 1909), and 23 *Neue Droste-Hulshoff Briefe* (edit. M. Schneider, 1923).

DROUAI, JEAN GERMAIN (1763-1788), French historical painter, was born in Paris. His father, François Hubert Drouais, and his grandfather, Hubert Drouais, were well known portrait painters, and he studied first under his father, then under Brenet, and finally under David. He accompanied David to Rome,

where he was influenced by the remains of ancient art and by the works of Raphael Goethe, who was at Rome when the picture was finished, has recorded the deep impression made by his "Mar us at Minturno" The last picture which he completed was his "Philoctetes on the Island of Lemnos"

DROUET, JEAN BAPTISTE (1763-1848), French revolutionary, was born at Ste Menehould, where his father was postmaster The carriages conveying Louis XVI and his family on their flight to the frontier stopped at his door on the evening of June 21, 1791, and the passengers were recognized by Drouet, who took steps which led to their arrest and detection on reaching Varennes For this service he declined a reward In Sept 1792 he was elected deputy of the convention He voted the death of the king without appeal, showed implacable hostility to the Girondins, and proposed the slaughter of all English residents in France He was captured at the siege of Maubeuge, and imprisoned at Spielberg till the close of 1795 He then became a member of the Council of Five Hundred, and was named secretary Drouet was implicated in the conspiracy of Babeuf, and was imprisoned, but he made his escape into Switzerland and thence to Tenerife There he took part in the successful resistance to the attempt of Nelson on the island in 1797, and later visited India The First Empire found in him a double subject of Ste Menehould After the second Restoration he had to leave France Returning secretly he settled in London, under the name of Merger and a guise of piety, and died there on April 11, 1824

See G. Lenotre, *Le Drame de Varennes* (Paris, 1905)

DROUGHT (DROUTH) results from long continued dry weather and lack or insufficiency of rain which causes exhaustion of soil moisture, suffering of plants from lack of water, depletion of underground water supplies and reduction and eventual cessation of stream flow Only when the rate of rainfall exceeds the rate of evapotranspiration (evaporation and transpiration combined) is there a surplus of water for soil moisture recharge, ground water recharge and runoff On the other hand, when the rate of transpiration exceeds the rate of precipitation, moisture in the root zone of the soil will be used up So long as soil moisture is deficient, water cannot pass through the root zone to replenish ground water, nor does it produce appreciable amounts of surface runoff Ground water sustains stream flow, but, as long as there is no ground water recharge, the ground water reserves will gradually decline and stream flow will diminish Thus, the various aspects of drought are interrelated Absence of rain means utilization and rapid exhaustion of soil moisture with consequent damage to plants and reduction of crop yield, the dry soil prevents addition of water to ground water reserves which are consequently gradually depleted

Drought is most accurately described as a condition in which the amount of water that is needed for evaporation and transpiration exceeds the amount actually available Because of the difficulty of determining water needs, however, drought has most often been defined as a period of consecutive days without rainfall According to a U.S. weather bureau definition a drought exists whenever the rainfall for a period of 21 days or longer is but 30% of the average for the time and place Tennessee Valley authority meteorologists defined drought similarly The British Rainfall organization defined an "absolute" drought as a period of at least 15 consecutive rainless days Other attempts to define drought restrict the rainfall to a definite percentage of the monthly or annual normal value One such definition states that drought occurs when the annual precipitation is 75% of normal or monthly precipitation is 60% of normal, another says that any amount of rainfall less than 85% of normal constitutes drought

It is evident that drought cannot be defined as a shortage in rainfall alone because such a definition would fail to take into account the amount of water that is needed Furthermore the effect of a shortage of rainfall depends on whether the soil is moist or dry at the beginning of the period Drought begins only when the vegetation can no longer absorb water from the soil rapidly enough to replace that lost to the air by transpiration It does not necessarily begin on the day that rain ceases but rather only when soil moisture is exhausted

There are three basic types of drought The first, called "permanent drought," is characteristic of the driest climates The sparse vegetation is adapted to drought, and agriculture is impossible except by irrigating through the entire crop season In regions of permanent drought stream flow is absent, there is no runoff except locally when a rare rain occurs The second, or "seasonal drought," is found in the climates that have well-defined rainy and dry seasons The natural vegetation is made up of plants that produce seeds during the rainy season and then die, and of plants that remain alive but become dormant in the dry season For successful agriculture, planting dates must be adjusted so that the crop develops during the rainy season Otherwise, irrigation is necessary Stream flow is periodic, all but the largest streams may become completely dry during the dry season The third kind of drought results from the fact that rainfall is irregular and variable everywhere These are "contingent droughts" They are due to the accidental failure of rainfall and are not certain to occur in any definite season, but they are most probable in summer when water needs of plants are greatest They may occur almost everywhere, even in the areas of seasonal drought, but are most characteristic of sub-humid and humid climates They are usually brief and irregular and may affect a relatively small area They vary greatly in intensity and time of occurrence and cannot be anticipated

A fourth type called "invisible drought" can also be recognized Even when summer showers are frequent they may not supply enough water to restore that lost by evaporation and transpiration The result is a borderline water deficiency that cuts crop yields to a small fraction of the potential When water is supplied to the crops by irrigation to make up the deficiency, crop yields increase twofold and threefold

The amount of water in the root zone of the soil at any time is a result of the interaction of two meteorologic processes—precipitation, which adds water to the soil, and evapotranspiration, which removes it The meteorologic forces that determine the amount and distribution of precipitation are not the same as those that govern the need for it The distribution of precipitation in space and time over the inhabited parts of the earth is reasonably well known On the other hand, almost nothing was known at mid 20th century of the similar characteristics of evapotranspiration It would be possible to measure actual evapotranspiration as soon as existing methods were perfected But since potential evapotranspiration does not represent actual transfer of water to the atmosphere but rather the transfer that would be possible under ideal conditions of soil moisture and vegetation, it usually cannot be measured directly but must be determined experimentally

The many studies that have been made reveal that evapotranspiration depends principally upon four things, climate, soil moisture supply, type of plant cover and type of land management Contrary to popular opinion the last two factors are relatively unimportant The climatic or atmospheric factors determine the rate of transpiration as long as there is no deficiency of moisture within the transpiring parts of the plant

The moisture content of the soil determines the supply of water to the absorbing roots and thence to the transpiring parts Thus, as long as soil moisture is not deficient, temperature and sunshine are the chief controlling factors The relation between temperature and sunshine and evapotranspiration observed at various places in western United States provides a useful basis for determining potential evapotranspiration elsewhere, at least approximately

Annual potential evapotranspiration varies from less than 30 in. in the north of the United States to more than 50 in. in the south In the arctic tundra it is less than 10 in. and in some parts of the tropics it is more than 60 in.

Except in equatorial climates, the potential evapotranspiration varies systematically from month to month throughout the year, it is quite small or negligible in winter and, even in the polar regions, is large in summer

This periodic variation between winter and summer which is associated with the apparent motion of the sun gradually di-

minishes in the tropical regions until at the equator it disappears. Potential evapotranspiration may vary from month to month, however, even in full equatorial climates. For example, in Manaus, Brazil, within 3° of the equator, the need for water is highest in August, September and October during the dry season and least in February at the height of the rainy season.

Almost everywhere in the world soil moisture is deficient at some time during the year. The magnitude of the deficiency

has been done to the crop. Water is available for supplemental irrigation in most humid regions. The benefits to be secured by adding the right amount of water at the right time are gradually coming to be understood.

Drought is the most serious physical hazard to agriculture in nearly every part of the world. Since both precipitation and the demands for water by crops vary from one year to another, there is a similar great variation in the magnitude of drought. To be able to forecast drought incidence and intensity a season, or even a few weeks in advance, would be of inestimable value to agricultural, industrial and commercial interests. For many years a tremendous amount of effort was expended by official agencies and private individuals all over the world in attempts to develop reliable means of making seasonal drought forecasts. By the middle of the 20th century no method had been found and the possibility of finding one appeared unlikely.

Even more important than forecasting drought would be the ability to control it through the artificial production of rainfall. Tremendous interest was aroused in the possibility by experiments in cloud seeding with dry ice and silver iodide. By 1950 the controversy had become particularly acrimonious, with most meteorologists denying that rain making by these means had been demonstrated and the growing number of "rain makers" accusing the meteorologists of being conservative or reactionary. There was at that time still no reason to believe that drought was likely to be controlled or reduced in importance.

Geogr.*, vol. 37, no. 2, pp. 87-100 (1947). (C. W. T.)

DROWNING AND LIFESAVING Death by drowning occurs when the victim's mouth and nose are submerged in water or other liquid long enough to cause suffocation. With the respiratory orifices blocked by water during the act of drowning, the supply of oxygen in the blood stream cannot be renewed. Then, because of oxygen impoverishment of the blood stream and the tissues, progressively consciousness is lost, motion ceases, respiratory effort is no longer made and eventually the heart stops beating and death ensues.

Lifesaving is the collective term by which all the means and skills which may be employed to save the life of a person in the act of drowning, and to resuscitate the apparently drowned, are known.

The common causes of drowning are well known. The immediate cause among nonswimmers is inability to float or to swim when forced into water beyond standing depth. Nonswimmers drown (1) as a result of stepping off into deep water in a channel, a depression in the bottom or from a shelving shore, (2) by being knocked off the feet in surf or swift running currents and being swept into deep water, (3) by falling into deep water from banks of streams, from piers, from bridges or from watercraft of various sorts, (4) by capsizing or sinking of watercraft, and (5) by ill advised attempts to rescue others in danger of drowning when lacking the skill to do so effectively.

Novice swimmers most frequently drown, or have a near-drowning experience, as a result of overestimating their newly acquired aquatic ability in attempting to swim a given distance in deep water. Less often they drown as a result of diving into shallow water and losing consciousness as a result of hitting the head against the bottom. Not infrequently also novice swimmers lose their lives in attempting a swimming rescue. Truly skilled swimmers are rarely numbered among those who drown. When they are it is generally because they can exercise no control of the situation in which they are forced into the water, as in the case of a ship sinking or an aeroplane being ditched far from shore, and are forced to swim or to remain afloat for periods beyond the limit of their endurance.

The ways in which drowning accidents may be prevented are also well known. Nonswimmers and novices should confine their bathing activities to supervised swimming pools and other bathing places known to be safe. Then, under the tutelage of a com-

MARCH OF PRECIPITATION THROUGH THE YEAR COMPARED WITH THAT OF WATER NEED AT SIX SELECTED WEATHER STATIONS. DROUGHT OCCURS WHEN NEED EXCEEDS WATER SUPPLY AND AFTER AVAILABLE SOIL MOISTURE HAS BECOME EXHAUSTED.

is the most direct measure of drought and represents, of course, the amount by which the precipitation fails at any time to provide an adequate water supply to the vegetation. It is the amount which should be supplied to crops by irrigation to assure maximum yields.

Even in humid climates such as eastern United States or western Europe droughts are frequent and severe. More often, however, the rains are spaced only a little too far apart in time or are too light to supply needed water at the right time. Soil moisture is deficient and drought results although it may not be recognized by any visible signs until after serious damage has

petent instructor, they should learn how to swim skilfully. Novice swimmers should be able to swim twice the distance along shore in water of standing depth that they wish to swim outward into deep water, before they make the attempt. Non-swimmer, novice and skilled swimmer alike should learn and employ in case of emergency such methods of rescue as are within their respective capacities to perform. Furthermore, no bather or swimmer, regardless of degree of aquatic skill or lack of it, should enter the water at unsupervised places, when choice is possible, unless he is accompanied by one or more persons capable of rendering aid in case of emergency. The largest number of drowning accidents occur within 10 yd. of the shore or of water of standing depth, or a similar distance from the comparative safety of a pier float or overturned small craft of one sort or another.

Forms of rescue are divided into four categories: those which can be made in reasonable safety by anyone, regardless of swimming ability, by reaching or by using extensions, those which can be made by throwing, those which can be made by means of some kind of small craft (generally a rowboat), and those which can be made only by swimming.

Hand rescuing requires first that the rescuer have a firm stance, or position, or hand hold, so that he may not lose his balance or be drawn into the same situation as the person he is attempting to aid. The rescuer should always grasp the victim rather than allow the victim to grasp him. Almost anything handy to the situation may serve as an extension to effect the rescue of a person beyond hand reach. Thus a branch of a tree, an oar, a boat hook, a fishing rod or even a coat or a shirt may be the instrument used to draw a person to safety.

Throwing rescues are commonly made with ring buoys, inflated tubes, life jackets, floating seat cushions or other devices possessing enough buoyancy to enable the drowning person to keep the nose and mouth above water while holding to it. Care should be taken to throw the object close enough to the victim so that he can reach it in his struggles to stay on the surface. Heaving lines and small ring buoys with lines attached may be cast accurately and effectively up to 60 ft. Care should be taken by the rescuer to hold one end of the line so that the victim may be drawn to safety, or the device may be retrieved in the event of a bad throw.

A rowboat may be used quite safely and effectively in making a rescue by anyone who knows how to handle a boat, if the following procedure is followed. To make contact with the victim, back the boat toward him and either place the stern in his grasp, or boat the oars and move to the stern to seize him, if he is unable by virtue of exhaustion to help himself effectively. In either event the rescuer should then contrive to haul the victim into the boat over the stern, if strong enough, or hold him over the stern with the face above water until help arrives. No amount of heaving or crambling at the stern of the boat will cause it to overturn, whereas if the victim is allowed to grasp the side a capsize will almost inevitably follow.

A swimming rescue is dangerous and should be employed only if no other means of rescue is available or can be used effectively, and only if the rescuer is either skilled in lifesaving or a strong swimmer. There are several forms of swimming rescue and many specialized lifesaving skills to meet varying conditions, but a description of the principles involved and of the most basic form of swimming rescue must suffice.

To make an effective swimming rescue, the rescuer should approach the drowning victim from the rear if possible, even though it involves circling the victim to attain that position (fig. 1). Watching his chance, the rescuer should swim to within arm's reach of the victim and drop his legs to a point a little forward of the vertical. When opportunity presents he should grasp the victim firmly by the hair, or the collar, if the victim is clothed, turn on his side, and start swimming strongly with the legs and the free arm, keeping

the holding arm rigidly straight (fig. 2). No attempt should be made to lift the victim's head above water, because the act of swimming away will not only bring the victim's face above the surface, thus enabling him to breathe, but it will also plane the victim's body quickly to the horizontal position, thus making towing much easier. In the event that the victim sinks beneath the surface as the rescuer manoeuvres into position to rescue him, the rescuer should unhesitatingly follow him down, reverse his position and pull him to the surface by the hair or collar, and then tow him to safety.

Restoring Respiration—After a person stops breathing as a result of drowning he may linger for a little time in that twilight zone known as a state of suspended animation as the heart continues to beat feebly before life becomes extinct. If he can be removed from the water and brought to shore within a few minutes of the time he sank beneath the surface it is sometimes possible to resuscitate him by artificial means. The usual form of resuscitation in the apparently drowned is to induce respiration by manual or mechanical means, in other words, to breathe for him until he can breathe for himself or until he becomes extinct.

Approximately 70 methods of exchanging gases in a drowned person's lungs manually or mechanically have been devised and employed over the years but few have survived the test of time and use. Of these few, most widely known and used is the prone pressure method devised by E. A. Schafer (later Sir Edward Sharpey Schafer) of the University of Edinburgh in 1903.

FIG. 2—HAIR CARRY

Time and extensive use began to produce wide variations in the techniques employed in applying the Schafer prone pressure method, but gradually uniformity was brought about and a single standard method was agreed upon, with only minor variations of no great moment.

The Schafer Method—The standard prone pressure method for use in resuscitating the apparently drowned is performed as follows: Lay the patient on his abdomen, one arm extended directly overhead, the other arm bent at elbow and the face turned outward with resting on hand or forearm, so that the nose and mouth are free for breathing.

Kneel straddling the patient's thighs with knees placed at such a distance from the hip bones as will allow the operator to assume the first position illustrated (fig. 3). Place the palms of the hands on the small of the back with fingers resting on the ribs, the little finger just touching the lowest rib, with the thumb and fingers in a natural position and the tips of the fingers just out of sight. With arms held straight, swing forward slowly, so that the weight of the operator's body is gradually brought to bear upon the patient. The shoulder should be directly over the heel of the hand at the end of the forward swing. Elbows should be kept rigid (fig. 4). This operation should take about two seconds. Immediately thereafter the operator swings backward, so as to remove the pressure completely. After two seconds, he swings forward again. This repeats deliberately 12 to 15 times a minute, the double movement of compression and release, a complete respiration in four or five seconds.

BY COURTESY OF THE AMERICAN NATIONAL RED CROSS

FIG. 3—FIRST POSITION IN ARTIFICIAL RESPIRATION PRIOR TO APPLYING PRESSURE

As artificial respiration should be continued without interruption until natural breathing is restored (if necessary, four hours or longer) or until a physician declares the patient dead. As soon as artificial respiration has been started and while it is being continued an assistant should loosen any tight clothing about the patient's neck, chest or waist. No liquids of any kind should be given by mouth until the patient is fully conscious.

BY COURTESY OF THE AMERICAN NATIONAL RED CROSS

FIG. 1.—REAR APPROACH IN LIFESAVING

To avoid strain on the heart when the patient revives, he should be kept lying down and not allowed to stand or sit up. If the doctor has not arrived by the time the patient has revived, the patient should be given some stimulant, such as one teaspoonful of aromatic spirits of ammonia in a small glass of water or a hot drink of coffee or tea, etc. The patient should be kept warm.

A brief return of natural respiration is not a certain indication for stopping the resuscitation. Not infrequently the patient, after a temporary recovery of respiration, stops breathing again. The patient must be watched and if natural breathing stops, artificial respiration should be resumed at once. In carrying out resuscitation it may be necessary to change the operator. This change must be made without losing the rhythm of respiration. By this procedure no confusion results at the time of change of operator and a regular rhythm is kept up. (See also ARTIFICIAL RESPIRATION.)

DROYSSEN, JOHANN GUSTAV (1808–1884), German historian, was born on July 6, 1808, at Treptow, Pomerania, son of an army chaplain. In his childhood Droysen witnessed some of the military operations during the War of Liberation, for his father was pastor at Greifenhagen, near Stettin, occupied by the French in 1813. The impressions of these early years laid the foundation of his ardent attachment to Prussia. He was educated at the gymnasium of Stettin and at the University of Berlin. Droysen occupied various positions in the schools as well as at the University of Berlin until 1840, and there his early works, on Alexander the Great and on Hellenism, were mainly written.

In 1840 Droysen succeeded F. C. Dahlmann (q.v.), professor of history at Kiel, and was drawn into the political movement for the defense of the rights of the Elbe duchies. In 1848 he was elected a member of the Frankfurt parliament and acted as secretary to the committee for drawing up the constitution. A determined supporter of Prussian ascendancy, he retired after the king of Prussia refused the imperial crown in 1849. In 1850, with Carl Samwer, he published a history of the dealings of Denmark with Schleswig Holstein, *Die Herzogthümer Schleswig Holstein und das Königreich Dänemark seit dem Jahre 1806* (Hamburg, 1850, Eng. trans., 1850), a book formative of German public opinion on the rights of the duchies in their struggle with Denmark. After 1851 he had to leave Kiel, and he was appointed to a professorship at Jena, in 1859 he was called to Berlin, where he remained until his death. In 1851 he brought out his admirable biography of Count Yorck von Wartenburg (1811–52) and then began his great work on *Die Geschichte der preussischen Politik* (7 vol., 1855–86). It forms a complete history of the growth of the Prussian monarchy down to the year 1756. This, like all Droysen's work, shows a strongly marked individuality and a great power of tracing the manner in which important dynamic forces worked themselves out in history. Droysen died in Berlin on June 19, 1884. His eldest son, Gustav (1838–1908), wrote *Gustav Adolf* (Leipzig, 1869–70), *Herzog Bernhard von Weimar* (Leipzig, 1885), an admirable *Historischer Handatlas* (Leipzig, 1885), and several writings on various events of the Thirty Years' War.

DROZ, FRANÇOIS-XAVIER JOSEPH (1773–1850), French writer on ethics and political science, was born at Besançon, of a legal family. Moving to Paris in 1803, he became intimate with Jean François Ducs and Pierre Jean Georges Cabanis, and it was on the latter's advice that, in order to catch the public ear, he produced the romance of *Lina*, which Sainte-Beuve characterized as a mingled echo of Florian and Werther. He obtained a post in the revenue office, but from 1814 he devoted himself exclusively to literature and became a contributor to various journals. Already favourably known by his *Essai sur l'art d'être heureux* (Paris, 1806), his *Éloge de Montaigne* (1812), and his *Essai sur le beau dans les arts* (1815), he not only gained the Montyon prize in 1823 by his work *De la philosophie morale ou des différents systèmes sur la science de la vie*, but also in 1824 obtained admission to the French academy.

The main doctrine inculcated in this treatise is that society will

never be in a proper state until men have been educated to think of their duties and not of their rights. It was followed in 1825 by *Application de la morale à la philosophie et à la politique*, and in 1830 by *Economie politique, ou principes de la science des richesses*, which was edited by Michel Chevalier in 1854. His greatest work was a *Histoire du règne de Louis XVI* (3 vol., 1838–42). As he advanced in life Droz became more religious, and his last work was *Pensées du Christianisme* (1844).

BIBLIOGRAPHY—P. G. Guizot, *Discours académiques*, Charles de Montalembert, "Discours de réception," in *Mémoires de l'Académie française*, C. A. Sainte Beuve, *Causeries du lundi*, t. iii, Michel Chevalier, notice prefixed to the *Economie politique*.

DROZ, NUMA (1844–1899), Swiss statesman, was born on Jan. 27, 1844, at La Chaux de Fonds. After teaching school, he became editor of *National Suisse* in 1864. Four years later he was made a member of the council of Neuchâtel, in 1875, of the federal chamber, and in 1881 and again in 1887 he was president of the Swiss confederation. His works are *L'Instruction civique* (1886), *Essais économiques* (1895), and *Études et portraits politiques* (1895).

DRUDE, PAUL KARL LUDWIG (1863–1906), German physicist, was born at Brunswick on July 12, 1863. He studied at Göttingen, Freiburg and Berlin. Drude was extraordinary professor of physics at Leipzig (1894–1900), professor of physics at Giessen (1900–05) and, finally, professor of physics at Berlin. His most important work was his application of J. C. Maxwell's electromagnetic theory, as developed by H. R. Hertz, to the problems of light, and a series of papers appeared between 1896 and 1899. Some of these were on the theory of magneto optical phenomena of iron, nickel and cobalt (1897), on the theory of anomalous dispersion (1898), on electric dispersion (1899), and on the optical constants of metals (1899). Later, Drude worked on electromagnetic oscillations. He also wrote two well known books, which have passed through many editions and have been translated into English, *Physik des Aethers* (1894) and *Lehrbuch der Optik* (1900). In 1900 he succeeded G. H. Wiedemann as the editor of the *Annalen der Physik*. Drude committed suicide on July 5, 1906.

DRUG, a district and town of former British India in the Chhattisgarh division of the Central Provinces. The district was formed in 1906 from portions of the districts of Bilaspur and Raipur (qq v). It has an area of 4,830 sq mi. and at that time the population, 676,000, showed a large decrease on the preceding census, but by 1941 it had recovered to 928,851. The district belongs to the Chhattisgarh rice plain and has the same undulating character, but contains more wheat land than its neighbours. Several irrigation storage reservoirs and the Tandula canal were constructed by the government after the great famine of 1900. There are nine Zamindar estates in the district, covering an area of 1,800 sq mi.

Drug, the capital of the district, is the only town among 2,533 villages. Its population has increased since it was made a district headquarters from 4,033 in 1901 to 76,766 in 1941. It is a station on the Bengal-Nagpur railway, and a rice market has been established there, but its local industries are petty.

DRUG, a substance ordinarily used for the treatment of disease which either suppresses or enhances the normal activity of the cell, tissue or organ on which it exerts its action (see PHARMACOLOGY and PHARMACOPŌIA). In a particular sense drug is often used synonymously for narcotics or poisonous substances, and hence "to drug" means to stupefy or poison.

DRUG ADDICTION may be defined as an overpowering impulse for narcotism or intoxication by any drug possessing narcotic or intoxicating properties. It is best exemplified by the overpowering influence possessed by opium and its preparations, and its alkaloids or derivatives such as morphine and heroin, and by cocaine and substances containing it. Persons who have become habituated to the continued use of these drugs find that they have become enslaved to them and that it is with the greatest difficulty that their use can be abandoned. Addiction drugs cause very great mental and moral deterioration, usually progressive in character.

Drug addiction is by no means confined to the above named drugs. Other examples are well known, thus, the barbituric acid (*g v*) derivatives, the sulfonal group (*g v*) of hypnotics, *Cannabis indica* (Indian hemp, bhang or hashish) may give rise to addiction. It has been observed in the use of paraldehyde, chloral, ether and chloroform. It is with the first group of drugs that addiction is very dangerous and most marked and where a habit is produced which it is most difficult to eradicate.

In Sept. 1924 a departmental committee was appointed by the British minister of health to inquire into morphine and heroin addiction, and especially to consider the circumstances under which these drugs may be supplied to persons suffering from addiction and the precautions necessary for the avoidance of abuse. This committee took evidence and finally issued its report on Jan. 21, 1926.

Occurrence—The universal opinion of those most competent to judge is that drug addiction is rare in Great Britain. In the U.S. special attention has been devoted to the subject during recent years and many official reports on it have been issued.

Laws and Regulations—Drug addiction has become an international problem and the laws and regulations in Great Britain are not the result of the special or peculiar needs of the country but are the reflection of international opinion and ideals.

The opium problem has been before the world for many years. Thus Warren Hastings, the first governor general of India, in 1788 declared opium to be "a pernicious article of luxury which ought not to be permitted but for the purpose of foreign commerce only." The United States became directly concerned in the far east opium problem when the Philippine Islands were ceded to it by Spain in 1898. The International Opium Commission of Shanghai was largely the result of Pres. Theodore Roosevelt's initiative and in consequence of this the International Opium convention at The Hague in 1911 and 1912 resulted. The recommendations of the convention formed part of the peace treaty of Versailles, and the consenting nations agreed to frame acts dealing with the dangerous drugs under consideration.

As a result, in Britain the Dangerous Drugs act was passed in Sept. 1920. In May 1921 regulations were passed dealing with the carrying out of the provisions of the act and further minor regulations were made in 1921 and 1923. In May 1923 the Dangerous Drugs and Poisons Amendment act was passed. Thus the motive factor for this legislation was the international problem and not the evil of drug addiction in Great Britain.

Legislation when once passed by parliament in Great Britain is, as a matter of course, rigidly enforced, and in consequence of this the regulations as regards the sale of dangerous drugs are efficiently carried out in Britain. Pharmacists and medical practitioners have, it is true, experienced great difficulty and inconvenience in the carrying out of the many regulations entailed, but they have loyally complied with their requirements.

Classes of Drug Addicts—The practice of indulging in habit-forming drugs is not limited to any one class of society, the high, the low, the rich, the weak and the strong are all represented. No nationality, race, colour or social class is exempt. Males predominate in the proportion of four white males to one white female. A large number of women drug addicts are prostitutes.

Causes of Drug Addiction—The causes of addiction are first, the influence and association with others who are habituated to their use; second, the indulgence for experience, curiosity, a thrill or bravado, (first and second account for about 65% of addiction), third, recourse to narcotics during emotional distress, fourth, to overcome drunkenness, fifth, improper medical treatment and self-treatment for the relief of pain. Ease of access to narcotics must be considered an important causative factor. The important underlying causes are related to the inherent constitutional individual make-up.

The Relief of Pain—It is necessary often after a surgical operation, particularly abdominal cases, for a hypodermic injection of morphine or heroin to be prescribed. This is a perfectly desirable and legitimate procedure but use of the narcotic drug should be limited to a few administrations. Otherwise, the risk of the formation of an addiction habit is great.

Again for the relief of pain of a neuralgic type the drugs morphine and heroin often act as a charm. But should they be continuously prescribed, an addiction habit is almost certain to develop. Much to be preferred, therefore, is the employment of other drugs such as phenacetin, pyramidon and aspirin, the use of which is not attended with this danger.

Employment in Insomnia Cases—In certain conditions it may be necessary to ensure sleep at all costs, and for this purpose the administration of morphine or heroin may be advisable. The frequent repetition of this is to be avoided. Too often the terrors of insomnia are impressed upon the patient, and he comes to regard the administration of a hypnotic as part of his daily life. The habitual use of hypnotics is greatly to be deprecated. It is entirely unnecessary, and no instance has yet been recorded of a fatal result from insomnia in human beings. The terrors of insomnia are not to be compared with those of drug addiction, and a little sleep following natural methods of treatment is of far greater benefit than the more prolonged abnormal condition of sleep produced by narcotic drugs.

Psychological Aspects—The psychoneurotic factor looms largely in drug addiction. Given an exciting cause—for example, the repeated daily administration of a narcotic drug—the danger of addiction is much greater in patients with a neuropathic temperament. A family history of insanity, neurosis or of alcoholism is usual among drug addicts, and they themselves previous to their addiction often present signs of nervous instability.

Often a psychological complex of a depressing type exists in patients of this group who are affected with worry and anxiety. There is a subconscious cry for relief from mental suffering. This is temporarily obtained by a narcotic drug, and, as surely as this occurs, so inevitably does a still deeper stage of mental agony develop which is only to be relieved by the further resort to the narcotic, and so drug addiction becomes established.

Toxaemic Conditions caused by toxic absorption from septic teeth, or by some nasopharyngeal infection such as septic tonsils or an infected antrum, may lead to low conditions of physical or mental health and so establish a neuropathic condition which may result in drug addiction. Such patients should be treated on general lines and their focus of infection eradicated as far as possible. The symptoms should not be masked by the administration of alcohol or addiction drugs.

Indispensable Uses—Narcotics are sometimes prescribed inadvisedly and contrary to pharmacological facts. They are unfortunately prescribed in some cases for mere satisfying of addiction. Abuses may be avoided by giving consideration to substituting nonhabit-forming drugs whenever possible. The *Journal of the American Medical Association* has issued a series of articles on the indispensable uses of narcotic drugs.

Symptoms—After the daily use of an addiction drug such as morphine, heroin or cocaine for about four weeks, in most cases an addiction habit develops. The patient's health becomes impaired, the complexion sallow, the tongue furred, the skin irritable, particularly in the case of cocaine where a constant sense of itching and discomfort arises. The mental and moral senses become affected. A constant state of deep depression results which is only temporarily relieved by further and increasing doses of the drug. Appointments are not kept, all responsibilities are neglected, and no reliance can be placed on any statements made, since drug addicts usually exhibit an utter disregard for truth.

Withdrawal Symptoms occur when the drug is withheld in cases of confirmed addiction, these comprise tremors, vomiting, diarrhoea and even collapse. Pains in the body and limbs may occur and mental symptoms of restlessness and apparent mental suffering are exhibited in a marked degree. The symptoms at once disappear after a further dose of the drug but recur when its effect passes off. Withdrawal symptoms are most marked in the cases of morphine and heroin, but they occur also although to a somewhat less degree, in the case of cocaine. Withdrawal symptoms in the case of drug addiction are now accepted as forming a definite symptom complex of characteristic type. And objective symptoms of definite type show that the symptoms are not purposely assumed by the patient with the object of obtaining

further doses of the drug

Treatment—When it has been determined that the drug addict is susceptible to being cured and is not in the class of the confirmed, hardened and habitual criminal, special care and medical treatment are required for proper rehabilitation. The first and most essential part of the treatment is complete and thorough supervision and care of the patient. This can only be ensured by treatment in an institution or nursing home. In early cases sudden withdrawal of the drug may be adopted, but where the addiction has continued for long periods, such as a year or more gradual withdrawal is advisable, so that after one to three weeks no drug is being given. A long further period of treatment is still required to improve the general health of the patient and above all to educate and restore his will power. For this purpose psychotherapeutic treatment (see *PSYCHIATRY Psychotherapy*) is of value. The prospect of cure depends on the extent to which the will power of the patient is restored and on the establishment of confidence and hopefulness, so that he is able to resist the desire to take the drug again.

In some cases of drug addiction hyoscine treatment has been advocated. This consists in the hypodermic administration of frequently repeated small doses of hyoscine, so that a condition of mild delirium lasting from 36 to 48 hr is produced. When this passes off, no addiction drug is given. The hyoscine treatment is not free from risk, since some fatal cases from its use have been recorded, and in general it does not appear to possess any advantages over the carefully regulated gradual withdrawal method.

Drug Addiction of Long Duration—When an addiction drug such as morphine or heroin has been taken over a period of many years, the prospect of cure is not good. In such cases it is probable that organic changes have taken place in the nervous system and other changes of a biochemical nature have occurred which alter the metabolic processes of the body.

There are diversities of opinion on phenomena of tolerance, disturbances in water, lipid and carbohydrate metabolism, dysfunction of the endocrine and vegetative nervous systems and the euphoria. Much research has been done.

Prevention—There is no doubt that the dangerous drugs regulations, irksome as they are to pharmacists and physicians, have done much in reducing drug addiction. Their rigid enforcement must prevent the development of fresh cases of addiction because of the great difficulties entailed in obtaining constant supplies of the drugs in question. The control of production of opium and of coca leaves, and the alkaloids obtained from them, strikes at the very root of the problem. There should be no surplus available for nonmedical and nonscientific purposes. An international control of the production of the "dangerous drugs" is required but has not yet been attained.

Care on the part of medical practitioners in the prescription of drugs of addiction is a most important factor in prevention of the drug habit, and there is every reason to believe that in point of fact the utmost care is being taken in this respect.

Illegal trafficking in dangerous drugs such as morphine, heroin and cocaine undoubtedly occurs to some extent, and this must be stamped out at all costs. Fortunately the full penal powers given by the Dangerous Drugs acts are such as to render this a most dangerous pursuit, and the number of those engaged in it in Great Britain is consequently small.

In the United States, most narcotic addicts use opium in the form of heroin or morphine. Opium smoking was once fairly

common but is now confined to a few Chinese in the large cities. Cocaine seizures reported to the United Nations have shown a disturbing increase. Most normal subjects, who became addicted years ago through self-medication with opium and many of the less unstable of the abnormal group have been cured permanently, leaving an unstable group who constantly relapse because of the instability that was responsible for their original addiction. Many of these have been "cured" from 10 to 20 times.

A study of delinquent addicts has shown that their original psychopathic character, rather than mental and moral deterioration caused by the use of narcotics, is responsible for the offenses they commit, but some of them have stolen in order to supply themselves with opium. An intangible but important aspect of the problem is the economic loss through addiction in the prime of life and the suffering and privation of individuals whose families are impoverished thereby.

The trend of drug addiction was steadily downward after a high peak reached during and after World War I, when it was estimated that there was 1 narcotic user in every 400 of the general population. By 1924 the rate of addiction was reduced to 1 in every 1,000 and by 1938 to about 1 in every 10,000 of the general population.

This rate of addiction was confirmed by statistics of the armed services. Rejections in World War I for drug addiction were 1 in every 1,500, as compared with 1 in every 10,000 in World War II.

The United States enforces the provisions of the international narcotic conventions of 1912, 1925, 1931 and 1936. In 1909 the federal government forbade the importation of smoking opium, but the first restrictive legislation was the Ohio Anti Opium Smoking Law of 1885. Practically all other antinarcotic legislation has been enacted since 1897. By 1912 every state except Delaware had an antinarcotic law. In 1950 every state and territory had such a law, but the most important one is the federal antinarcotic law known as the Harrison act, which became effective in 1915. It has been amended and supplemented, so that the federal government now traces opium and cocaine from the time a permit to import the crude drug is issued until the finished product reaches the consumer. Violations of the narcotic laws are punished by large fines and imprisonments of from one to ten years.

DRUIDISM was the faith of the Celtic inhabitants of Gaul until the time of the Romanization of their country, and of the Celtic population of the British Isles either up to the time of the Romanization of Britain, or, in parts remote from Roman influence, up to the period of the introduction of Christianity. From the standpoint of the available sources the subject presents two distinct fields for enquiry, the first being pre-Roman and Roman Gaul, and the second pre-Christian and early Christian Ireland and Pictland.

In the present state of knowledge it is difficult to assess the interrelation of druidic paganism.

Gaul—The earliest mention of druids is reported by Diogenes Laertius (*Vitae*, intro., 1 and 5) and was found in a lost work by a Greek, Sotion of Alexandria, written about 200 B.C., a date when the greater part of Gaul had been Celtic for more than two centuries and the Greek colonies had been even longer established on the

of the *tympanum* or cylindrically-shaped middle ear, and specially of the membrane that closes the external auditory meatus, and in architecture, of the sub-structure of a dome when raised to some height above the pendentives. The term is also applied to the circular blocks of stone employed in columns of large dimensions.

In music the drum (Fr *tambour*, Ger *Trommel*, Ital *tamburo*) is an instrument of percussion common in some form to all nations and ages. It consists of a frame or vessel forming a resonant cavity, over one or both ends of which is stretched a skin or vellum set in vibration by direct percussion of hand or stick. Drums fall into two divisions according to the nature of their sonority—(1) instruments producing sounds of definite musical pitch, and qualified there by to take part in the harmony of the orchestra, such as the kettle drum (*q v*), (2) instruments

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

LEFT TO RIGHT THE AFRICAN DRUM, HAWAIIAN DRUM AND SOUTH AMERICAN DRUM

of indefinite pitch, and therefore excluded from the harmony of the orchestra, such as the bass drum, the side or snare drum, the tenor drum, the tambourine, all used for marking the rhythm and adding tone colour.

The *bass drum* or *Turkish drum* (Fr *grosse caisse*, Ger *Grosstrommel*, Ital *gran cassa* or *tamburo grande*) consists of a short cylinder of very wide diameter covered at both ends by vellum, the tension of which is controlled by means of leather braces. It gives out no definite note, but has a place in every orchestra, although it is used but sparingly to accentuate the rhythm. Wagner did not once score for the bass drum after he composed *Kenia*.

The *side or snare drum* (Fr *tambour militaire*, Ger *Militartrommel*, Ital *tamburo militare*) is an instrument consisting of a small wooden or brass cylinder with a vellum at each end. Across the lower vellum are stretched two or more catgut strings called snares, which produce a rattling sound at each stroke on the upper head, owing to the sympathetic vibration of the lower head, which jars against the snares. The presence of the snares gives the side drum its peculiar timbre, changing the nature of the vibrations, for the snares form a kind of nodal contact, inducing double the number of vibrations, and a sound approximately an octave higher than would be the case were the heads left to vibrate freely.

The *tenor drum* (Fr *casse roulante*, Ger *Roll- or Ruhrtrommel*, Ital *tamburo rullante*) is similar to the side drum, but has a larger cylinder of wood and no snares, consequently its timbre lacks the brilliancy and incisiveness of the side drum.

The popularity of all kinds of drums in the most ancient civilizations is established beyond a doubt by the numerous representations of the instrument in a variety of shapes and sizes on the monuments and paintings of Egypt, Assyria, India, and Persia. The *tympanon*, under which name seem to have been included tambourines and kettle drums, as well as the dulcimer (during the middle ages), was in use among Greeks and Romans chiefly in the worship of Cybele and Bacchus, it was introduced through

the medium of the Roman civilization into western Europe. It is often said that the drum was introduced by the crusaders, but it was certainly known in England long before the crusades, for Bede (*Musica practica*) mentions it in his list of instruments, and Cassiodorus (i p 507) describes it. An actual drum with two curved drum sticks belonging to the ancient Egyptians was found

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

FRENCH CONGO DRUM

very similar freshwater drum (*Aplocheilichthys grunniens*), called also sheephead and thunder pumper, is a greyish, silvery fish some times attaining 3½ ft in length and 50 lb in weight. It occurs from Georgia and Texas to the Great Lakes but is especially abundant in the streams and lakes of the Mississippi valley. Its scales are thin and deep, with the larger ones on the breast. The freshwater drum is a popular food fish in the South but is little used in the North.

In architecture, a drum is a vertical wall, usually cylindrical, supporting a dome, commonly limited to walls carried at a considerable height by pendentives, or similar forms. The drum first appears in a developed form in Byzantine architecture (see *BYZANTINE AND ROMANESQUE ARCHITECTURE*). It later became a characteristic feature of almost all Renaissance dome design (see *DOMES*).

DRUMMOND, HENRY (1851-1897), Scottish evangelical writer and lecturer, was born in Stirling on Aug. 17, 1851. He was educated at Edinburgh university, and in 1877 became lecturer on science in the Free Church college, Glasgow. His principal work was *Natural Law in the Spiritual World* (1883), the argument of which was that the scientific principle of continuity extended from the physical world to the spiritual. In 1888 he published *Tropical Africa*, a valuable digest of information based on a visit to Africa in 1883. In 1890 he travelled in Australia, and in 1893 delivered the Lowell lectures at Boston, which were printed in 1894 under the title of *The Ascent of Man*, in which he argued that the disinterested care and compassion of animals for each other played an important part in effecting "the survival of the fittest," a thesis previously maintained by Prof. John Fiske. Drummond died on March 11, 1897.

See the *Life* by Sir G. A. Smith (1898).

DRUMMOND, JAMES (1835-1918), Unitarian scholar, was born in Dublin on May 14, 1835, and was educated at Trinity college, Dublin, and Manchester New college, London. In 1860 he became pastor of Cross Street chapel, Manchester, but nine years later returned to his old college in London as lecturer in biblical and historical theology. From 1885 to 1906 he held the principality, moving with the college to Oxford where he died on June 13, 1918. As a Unitarian, Drummond advocated doctrinal freedom. He regarded Christ as the highest revelation from God but rejected the Resurrection and the nature miracles. His acceptance of the Johannine authorship of the fourth gospel is elaborated in his *Inquiry into the Character and Authorship of the Fourth Gospel* (1903).

His other chief works are *The Jewish Messiah* (1877), *Philo-Judaicus*

A JAVANESE DRUM

(1888), *Via, Veritas, Vita* (Hubert lectures, 1894) and *Studies in Christian Doctrine* (1908) His *Psalm Meditations*, published posthumously in 1919, has a memorial introduction

DRUMMOND, SIR JAMES ERIC (16th EARL OF PERTH) (1876-1951), British statesman, first secretary-general of the League of Nations, half brother of the 15th earl of Perth, was educated at Bedford Grammar school and Eton and entered the British foreign office in April 1900. Later he became private secretary to the prime minister, Herbert Asquith, to Sir Edward Grey and to A. J. Balfour during his term of office as foreign secretary. He accompanied Balfour on his special mission to the United States in 1917 and remained with him during the first months of the peace conference in Paris, until, on the proposal of Pies Woodrow Wilson, he was appointed secretary general of the League.

The appointment lasted from the acceptance of the text of the covenant, April 29, 1919, until 1933, when Drummond became British ambassador in Rome.

Although the treaty was not signed and did not in fact come into force until Jan. 1920, the new secretary general began immediately to organize the secretariat of the League. Several different systems had been suggested, but Drummond decided from the first that it must be a basic principle of the new organization that its members should not be there as representatives of the interests of their own countries but should form an international civil service, each member of which should consider himself as the servant of the League as a whole and as bound to do his best to carry out its decisions with regard to national interests or desires.

Sir Eric Drummond made it his chief aim to establish the organization on a basis of unimpeachable solidarity. He adopted the principle that the duty of the secretariat was to act strictly in accordance with the decisions taken by the responsible authorities (i.e., by the members of the League acting through their constitutional organs) and to avoid all action not clearly based on authority constitutionally given. Drummond was ambassador to Rome from 1933 to 1939 and served as chief adviser on foreign publicity of the ministry of information in 1939-40. In 1946 he became deputy leader of the Liberal party in the house of lords.

He succeeded as 16th earl of Perth in 1937 and became a representative peer of Scotland in 1941. Drummond died at Rogate, Sussex, on Dec. 15, 1951.

DRUMMOND, THOMAS (1797-1840), British inventor and administrator, was born at Edinburgh, on Oct. 10, 1797, and was educated at the high school there. He was appointed to a cadetship at the royal military academy, Woolwich, in 1813, and in 1815 he entered the royal engineers. In 1820 he received an appointment on the trigonometrical survey of Great Britain. In 1825, when he was assisting T. F. Colby in the Irish survey, his lime light apparatus ("Drummond light") enabled observations to be completed between Divis mountain, near Belfast, and Slieve Donard, a distance of 67 mi. About the same time he also devised an improved heliostat, and in 1829 he was employed in adapting his light for lighthouse purposes. In 1835 he was made under secretary of state for Ireland, where he proved himself a most successful administrator. It was he who in 1838 told the Irish landlords that "property has its duties as well as its rights." In 1836 he proposed the appointment of a commission on railways in Ireland, and took a large share in its work. Drummond died at Dublin on April 15, 1840.

See J. F. McLeann, *Life of Thomas Drummond* (1867); R. Barry O'Brien, *Life and Letters of Thomas Drummond* (1889).

DRUMMOND, WILLIAM (1585-1649), called "of Hawthornden," Scottish poet, was born at Hawthornden, near Edinburgh, the son of John Drummond, first laird of Hawthornden. Drummond received his early education at the high school of Edinburgh, and graduated in July 1605 as M.A. of the recently founded University of Edinburgh. He spent two years at Bourges and Paris in the study of law, but in 1609, he was again in Scotland, where, by the death of his father in 1610, he became laird of Hawthornden. In 1612 began his correspondence with Sir William Alexander of Menstrie, afterwards earl of Stirling (q.v.),

which ripened into a life-long friendship.

Drummond's first poem appeared in 1613, an elegy on the death of Henry, prince of Wales, called *Tears on the Death of Mehadus* (Moeludus, 3rd ed. 1616). In 1616, the year of Shakespeare's death, appeared *Poems, Amorous, Funerall, Drume, Pastoral in Sonnets, Songs, Sexstans, Madrigals*, being substantially the story of his love for Mary Cunningham of Barns, who was about to become his wife when she died in 1615. The poems bear marks of a close study of Philip Sidney, and of the Italian poets. He sometimes translates direct from the Italian, especially from Giovanni Marini. *Forth Feasting A Panegyricke to the King's Most Excellent Majesty* (1617), a poem written in heroic couplets, celebrates James I's visit to Scotland in that year. In 1618 Drummond began a correspondence with Michael Drayton. The two poets continued to write at intervals for 13 years, the last letter being dated in the year of Drayton's death.

In the winter of 1618-19, Drummond had included Ben Jonson in his circle of literary friends, and at Christmas 1618 was honoured with a visit of a fortnight or more from the dramatist. The account of their conversations, long supposed to be lost, was discovered in the Advocates' library, Edinburgh, by David Laing, and was edited for the Shakespeare society in 1842. The publication of what was obviously intended merely for a private journal has given Jonson an undeserved reputation for harsh judgments, and has cast blame on Drummond for blackening his guest's memory.

In 1623 appeared *Flowers of Sion*. By William Drummond of Hawthornden, to which is adjoined his *Cypresse Grove*. From 1625 till 1630 Drummond spent much of his time travelling on the continent, but in 1627 he presented about 500 volumes to the library of the University of Edinburgh. In 1630 he again began to reside permanently at Hawthornden, and in 1632 married Elizabeth Logan, by whom he had five sons and four daughters. About 1635 he began his *History of Scotland during the Reigns of the Five Jameses*, a work which did not appear till 1655. His next work, entitled *Irene or a Remonstrance for Concord, Amity, and Love amongst His Majesty's Subjects* (1638), embodies his political creed of submission to authority as the only logical refuge from democracy, which he hated. In 1639 he had to sign the covenant in self protection, but was uneasy under the burden, as several political squibs by him testify. In 1643 he published *Xanaxia, or a Defence of a Petition tendered to the Lords of the Council of Scotland by certain Noblemen and Gentlemen*, a political pamphlet in support of those royalists in Scotland who wished to espouse the king's cause against the English parliament. Its burden is an invective on the intolerance of the then dominant Presbyterian clergy. His later works may be described briefly as royalist pamphlets, written with more or less caution, as the times required. Drummond took the part of James Montrose, and a letter from the royalist leader in 1646 acknowledged his services. He died on Dec. 4, 1649, and was buried in his parish church of Lasswade.

Drummond's most important works are *The Cypresse Grove* and the poems. *The Cypresse Grove* exhibits great wealth of illustration, and an extraordinary command of musical English. It is an essay on the folly of the fear of death. "This globe of the earth," says he, "which seemeth huge to us, in respect of the universe, and compared with that wide pavilion of heaven, is less than little, of no sensible quantity, and but as a point." This is one of Drummond's favourite moods, and he uses constantly in his poems such phrases as "the All," "this great All." Even in such of his poems as may be called more distinctively Christian, this philosophic conception is at work. Drummond was called "the Scottish Petrarch," and his sonnets, which are the expression of a genuine passion, stand far above most of the contemporary Petrarchan imitations.

BIBLIOGRAPHY—Drummond's *Poems*, with *Cypresse Grove*, the *History*, and a few of the minor tracts, were collected in 1668 and edited by Edward Phillips, Milton's nephew. *The Works of William Drummond, of Hawthornden* (1711), edited by Bishop Sage and Thomas Ruddiman, contains a life by the former, and some of the poet's letters. A handsome edition of the *Poems* was printed by the Maitland club in 1832. Later editions are by Peter Cunningham (1833), by

William R. Turnbull in "The Library of Old Authors" (1856), by W. C. Ward (1894) for "The Muses' Library" and by Prof. Kastner (Scott. Text Soc. 1913). The standard biography of Drummond is by David Masson (1871). Extracts from the Hawthornden manuscript in the Library of the Society of Antiquaries of Scotland were printed by David Laing in *Archaeologia Scotica*, vol. 19.

DRUMMOND, WILLIAM HENRY (1854-1907), Canadian poet, was born at Mohill in County Leitrim, Ireland, the son of an officer in the Royal Irish Constabulary, who emigrated with his family to Canada in about 1854. In 1869 Drummond obtained work as a telegraph operator at Bord-a-Plouffe on the Riviere des Prairies, but he afterward studied medicine at Bishop's college, Lennoxville, where he took his degree in 1884. From 1888 he practised medicine in Montreal, where he wrote verse in his leisure time. In 1905 he left his Montreal practice to look after the Drummond mines which he owned in conjunction with his brothers. His poems, some of the best known of which are *The Habitant* (1897), *Phil O Ruen's Canoe* (1898) and *Johnnie Courtnay* (1901) have been collected, with an introduction by Louis Frechette and an appreciation by Neil Munro (1912).

See J. F. Macdonald, *William Henry Drummond* (1925).

DRUMMONDVILLE, a city of Quebec, Canada, about 70 mi. ENE of Montreal, on the St. Francis river. It is served by the Canadian Pacific and Canadian National railways. It became a city in 1888, its population in 1911 being 1,725 and increasing by 1951 to 14,341. There are six Catholic churches, an Anglican church and a United Church of Canada, several primary and secondary Catholic schools, and a Protestant school which, although situated on the grounds of an Anglican church but having no official connection with any of the Reformed Churches, is generally called the "English School" although it accepts English Catholics, Jews and some French-Canadian Catholics.

As a consequence of 250,000 available horsepower of electric energy, Drummondville grew rapidly. The manufactures, with a gross value of more than \$40,000,000 at mid-20th century, were principally synthetic fibres, cotton, silk, printing, hosiery, rubber, pencils, doors and sashes and foundry products. (C. Cy.)

DRUMRIGHT, a city in one of the oil and gas fields of Creek county, Okla., U.S., 60 mi. NE of Oklahoma City, near the Cimarron river, and served by the Santa Fe railway. The city was founded in 1912 and incorporated in 1914. By 1950 the population was 5,028, in 1940 it was 4,303 by federal census. The principal manufacturing industry is refining petroleum.

DRUNKENNESS, a state of depression or partial paralysis of nerves resulting from the taking of a narcotic drug. Where not specified, the drug is assumed to be alcohol. Drunkenness may represent a single act, or, if repeated frequently it may develop into a habit. It is referred to euphemistically as "intoxication" or "inebriation."

Symptoms which are characteristic of drunkenness may result also from many different causes (e.g., epilepsy, brain injury, diabetes or kidney disease). Likewise, many other nerve depressing or paralyzing substances, such as anaesthetics, opiates, carbon monoxide or soporific drugs, may produce a condition simulating drunkenness. Nevertheless, by far the commonest cause of drunkenness is the drinking of an excessive amount of alcoholic beverage.

The factor which determines the degree of nerve depression and thus the extent of drunkenness, is the concentration of alcohol in the circulating blood. It has long been known (*cf.* Shakespeare's *Twelfth Night*, act 1, scene 5) that alcohol does not depress or numb all nerve activities at the same rate. The higher nerve functions of the forebrain, such as reasoning, judgment and social restraint are impaired by very low concentrations of alcohol in the blood. Cares, worries and tensions fade into insignificance, the world takes on a rosy hue, and the ego expands. The resulting talkativeness, hilarity and lack of restraint produce the appearance of a stimulation, although it actually is due to the depression of restraining influences. All persons do not show the same evidence of "his removal of inhibitions. Most persons become talkative and gay—even hilarious. But some become irritable, quarrelsome and pugnacious, others become negative and desire to be left alone, some become remorseful and develop fits of weeping. The particular manifestation of release from restraint or inhibition probably depends upon the fundamental disposition of the subject. Humans show some variation in susceptibility to alcohol, just as they do to all other drugs. This is partly due to differing experience in drinking, as evidenced by the fact that habitual users of alcoholic liquor can tolerate larger quantities than abstainers. But a part of this tolerance is inherent in the individual, regardless of experience. In

alcohol use. The relationship between the concentration of alcohol in the circulating blood and the corresponding stage of drunkenness is roughly as follows:

- 0-0.04% No effects detectable except by refined psychological tests.
- 0.05%-10% Some persons show indications of alcohol influence, such as slowing of responses to stimuli, erratic judgment and emotional disturbance.
- 10%-15% Most persons show indications of alcohol influence, with muscular incoordination and narrowing of vision.
- 15%-22% All persons are "under the influence of alcohol."
- 22%-33% Mental confusion and disorientation, staggering gait, slurred speech, this is the stage at which persons are ordinarily referred to as "drunk."
- 33%-44% Stupor.
- 44%-55% Unconsciousness.
- 55% or more Nerve depression becomes irreversible, fatal paralysis results.

At high altitudes or in atmospheres deficient in oxygen, alcohol in toxication is greatly accentuated. On the other hand, the breathing of pure oxygen will cause an intoxicated person to sober up somewhat more quickly than if he breathes ordinary air (20.6% oxygen). These observations suggest that the depression of nerve function by alcohol is referable to an interference with oxidative processes in nerve cells.

Alcohol is gradually eliminated from the body, largely by oxidation in the liver. Very small percentages of alcohol are eliminated in the breath, urine or perspiration. After a drunken debauch, unpleasant residual symptoms of hang over remain—a throbbing headache, feeling of weakness and nausea and general malaise. One may obtain temporary respite from these by a repetition of the cause, and thus an act of acute drunkenness may develop into chronic or habitual drunkenness.

Excessive use of alcoholic liquor appears to be referable to desire on the part of the individual to escape from or ameliorate some unpleasant situation. Persons who are in grave difficulty, whether real or imaginary, or who suffer from an inescapable feeling of inadequacy, impotence, frustration or failure, often turn to alcoholic liquor as an avenue of escape. Learning more and more upon this escape mechanism leads to habitual drunkenness. This craving for liquor (dysmanism) may result in compulsive daily upping or in periodic intense debauches of a week's duration, interspersed with long periods of comparative sobriety. Such habitual drinkers often drink alcoholic liquor to the exclusion of normal food and some of the resulting neurological disturbances are referable to dietary deficiency. Chronic alcoholism gives rise to mental as well as social deterioration and eventually produces degenerative changes in such vital organs as the liver, kidneys and brain. Social delinquency is associated with drunkenness although it is not clear that excessive alcohol use causes asocial or antisocial behaviour. It may be that persons with such tendencies more frequently turn to alcohol as a means of escape from an unfriendly or repressive environment.

DRURY, SIR WILLIAM (1527-1579), English statesman and soldier, was the son of Sir Robert Drury of Hedgerley, Bucks., and grandson of another Sir Robert Drury (d. 1536), who was speaker of the house of commons in 1495. He was born at Hawstead, Suffolk, on Oct. 2, 1527, and was educated at Gonville hall, Cambridge. In 1559 he was sent to Edinburgh to report on the condition of Scottish politics, and five years later he became marshal and deputy governor of Berwick. He was frequently sent on errands to Scotland and conducted raids over the border, and he commanded the force which compelled Edinburgh castle to surrender in May 1573. In 1576 he was sent to Ireland as president of Munster, and in 1578 he became lord justice to the Irish chief, taking the chief control of affairs after the departure of Sir Henry Sidney. Drury's letters to Lord Burghley and others are invaluable for the story of the relations between England and Scotland.

DRUSES, the adherents of an esoteric religion founded in the 11th century after Christ by the Fatimid Caliph of Egypt, Al-hakim bi'amrillah, the son of a Russian mother, who proclaimed himself an incarnation of God, established a reign of terror at Cairo and finally disappeared mysteriously (A.D. 1021). They take their name from his missionary, Ismail Ad-darazi, who preached the cult of Al-hakim among the Syrians. Their origin is probably mixed, their traditions derive them from Arab colonists, but some of their chief families claim Turkoman or Kurdish descent, and there is an obvious North Syrian (Armenoid) infusion among some of the Druses in the Lebanon. They have always been confined to Syria, and like other small and often persecuted near eastern sects, such as the Yazidis and the Assyrian Christians, have preferred the relative security of the mountains to the insecure advantages of the plains. They have

three strongholds—the districts of Shuf and Metn in the Lebanon, the western slopes of Mt. Hermon, and the mountains which separate the cornlands of the Hauran from the Syrian desert. There are Druse villages on Mt. Carmel, and small outliers of no political importance in Northern Syria and in the Anti-Lebanon. French statistics estimate their numbers at 48,000 in the Hauran mountains, which are generally known as the Jabalu d-Duruz (i.e., mountain of the Druses), 7,000 in the Hermon area, and 43,000 in the Lebanon. There are about 7,000 Druses in the British mandated territory of Palestine, and an unknown number in the United States of America, where the Druse immigrant usually passes as a Syrian Christian. The permission given to a Druse to conform outwardly to the faith of the unbelievers among whom he dwells, which is an interesting feature of their religion makes it difficult to attempt an estimate of the number of Druses living outside the Syrian strongholds of the sect.

The name Druse is first mentioned by Benjamin of Tudela (c. A.D. 1170) and little is known of the beginnings of the political power of the great families whose history is that of the Druse community. The Druses first appear in Arab records as mountain villagers of Lebanon, Hauran and West Hermon, yielding feudal service in return for military and political protection to various families of seigniors (Al umara) who quarrelled incessantly for the headship of the community. Their chief political centre lay in the southern Lebanon. Khalwatul-Bayadh in the Hermon was their religious centre at a very early date, the Hauran community was unimportant. Religious proselytism has been discouraged or forbidden by their spiritual chiefs in recent centuries, but the fact that Malikul 'Ashraf, the Mameluke sultan of Egypt compelled the Lebanese Druses to conform outwardly to Sunni Islam about A.D. 1300 suggests that their leaders, the Tnuh House, had sought more than political domination over the mixed population of "the mountain." After their defeat by the Mamelukes the power of the Tnuh waned, to the advantage of the Maan family, recent immigrants from northern Arabia who may have been proselytes.

The Maan amirs were shrewd and politic, the family threw its influence and retains into the scale against the Mamelukes when Selim the Grim invaded Syria in 1516. The victor recognized their supremacy over the Druse, Muslim and Maronite chiefs of the Lebanon, and for three generations they thrived mightily under Turkish protection. The reign of Fakrud din Maan II marked the zenith of their power. By treaties, by the protection of small chiefs against great, and by successes in various baronial wars, he extended the feudal sway of his house, nearly as far as Antioch in the north, built a castle at Palmyra in the eastern desert and drew a large revenue from the ports of Beirut, Saida (Sidon), Latakia and Tripoli in Syria. Success, however, turned his head, he intrigued against the Turk, and in 1614 was defeated by the pasha of Damascus and fled to Italy, where he intrigued with the rulers of Tuscany and Naples and apparently incited the propaganda with which the Druses were descended into a crusading count of Dreux. In 1616 he returned, recovered his power and ruled as an independent prince until 1635, when a Turkish army defeated and captured him with his sons. The last strong line used their lives at Constantinople.

After a welter of civil war in which the combatants were divided into the ancient Arab factions of Yacoub and Qais—the Shamirs and Caravids of the Arab world—a new family, the Shihab of Mt. Hermon, became master of the mountain. They were descendants of early Arab governors of Hauran, had intermarried with the Maan family, and deserted them when they fell. But they never adopted the Druse creed and several of them appear to have become Maronite Christians in the 18th century, thus causing the dangerous suspicion of apostasy to fall on the house. From Halid, third of the line, who defeated the Turks and Druse rivals at Ain Dara in 1711, to Beshir the last great Shehab amir, they played the old game, now rebelling against the weak sultans of the decadence, now bribing their governors, and constantly at war with the rival house of Jumlat. Beshir became amir of the mountain in 1786 and for 54 years, with two brief intervals

of exile, held his own by the time honoured expedient of aiding and betraying one rebel satrap after another. He successfully supported and betrayed Ahmad Jezzar and Abdullah of Acre, and cultivated the friendship of infidel admirals, threw in his lot with Mohammed Ali of Egypt and his son Ibrahim, but deserted them in 1839 when the Powers, save France, were turning against them. But Ibrahim held Druse hostages, and so Beshir, though he promised much, gave little help to Powers or Porte. After Ibrahim's expulsion from Syria the Turks called him to account. He fled to Malta on a British ship but was induced to go to Constantinople, where he died in 1851.

Beshir may have been a crypto-Christian, his successor Beshirul-Qassim openly joined the Maronites, hoping to defeat Druse rivals with their aid. It was a suicidal policy, even the Druses of the Shehab faction distrusted and disliked their Christian allies, the rest became perforce pro-Muslim, and the Turkish Government, which was carrying out the centralizing policy initiated by Mahmud the Reformer, saw danger in the alliance. For the next 20 years the history of the Lebanon is a monotonous record of murder, intrigue and civil war. The Maronites rebelled once, the Druses twice, against the Turks, who half heartedly attempted or pretended to impose reforms desired by the European Powers upon the turbulent mountain chiefs. Three constitutions were successively bestowed upon the Lebanon, which was twice "disarmed", European interference increased the exasperation of Druses and Muslims against the Maronites, and the scandal culminated in massacres of Christians which extended to the coast and to Damascus, where some 2,500 Christians were slaughtered and foreign consulates sacked (July 9, 1860). The Powers intervened. A French army occupied the Lebanon for nearly a year, and the Porte, after appointing a Christian governor general of the Lebanon, conferred a large measure of autonomy on the province by the Organic Statute of Sept. 6, 1864. The change made an end of the political importance of the Lebanese Druses. Beshirul-Qassim had been murdered, his family had lost wealth and prestige, and henceforth Druse political interests in Lebanon were mainly confined to such harmless subjects as the rivalry between a Jumlat or an Arslan for the governorship of a county. Those who found the change too distasteful migrated to the Hauran. The rest made the best of it, and till 1918 remained a conservative, rather aloof community, influential in the parish politics of the southern Lebanon.

The Hauran Druses.—By 1840 the influx of malcontents from the Lebanon had increased the small Druse community in the Hauran to 7,000 souls. For some time they remained independent and held out successfully in their stronghold, the lava field of the Leja, against Ibrahim Pasha's Egyptians in 1839, and Kibrishi Pasha's Turks in 1852. Their government was then theocratic under the *Rais* (chief) of the *Uqqa* (initiated) in Suwayda. In 1879 Midhat, the reforming governor general of the Damascus province, found them troublesome and formidable neighbours. Their numbers had increased to over 20,000 and their repression required an army corps. He imposed a qamaqam (lieutenant-governor) upon them and the office after a while became vested in the house of Atrash (pl. Tushun), but the majority of the clans refused taxes and military service. In 1896 the contumacious clans were defeated and their country ravaged by a Turkish army, but the campaign was costly and the Turks agreed to a compromise whereby the Druses were to pay taxes and serve as frontier guards on the desert edge in their own territory. A governor with a small Turkish force was stationed at Sheikh Saad, outside Druse territory proper, and the clans were left to fight as they pleased with the Beduin whom they usually defeated. After the Turkish revolution of 1908 the Government decided to garrison points in Druse territory. Some of the Tushun revolted in 1910 but the rebels were defeated and their chief, Yahya, executed. (D G H, G B.)

The French Mandate.—The Druse polity in the Hauran at the end of the World War remained feudal. The cultivated land attached to each village was communally owned and re-allotted at varying periods among the cultivators. The lords had prescriptive rights to the produce of certain demesne lands which

then peasants cultivated for them, but a peasant revolt late in the 19th century had restricted these demesnes. The ten noble families kept open house and maintained armed retainers. Clan solidarity and the sense of obligation between nobles and peasants were strong, but family jealousies usually prevented the chiefs from acting in unison.

During the World War the Druses, who had gained economic advantages by the opening of the Hejaz railway on the western edge of their territory, sat prudently on the fence and made money out of their crops until Sept. 1, 1918, when a section led by Sultan Pasha Al Atrash assisted Feisal and Col. Lawrence during their advance on Damascus. There Sultan Pasha gave the Sherifians trouble, and Lawrence has recorded that he was well nigh strangled during a conference by the redoubtable Auda abu-Tayy. The Druses maintained an attitude of reserve towards the Sherifian Government and after its overthrow by the French under Gen. Gouraud in July 1920, refused to join the Hauran Muslims in resisting the French mandate. Late in the year they entered into negotiations with the French, and on March 4, 1921, an agreement was signed by the acting high commissioner, M. de Caix, and sealed by a number of Druse spiritual and temporal chiefs, where by the Druse mountain (Jabal al-Duruz) was granted an independent national government headed by an elected native governor under the French mandate. On May 1 an informal assembly of notables elected Salim Pasha Al Atrash governor at Suwayda, the capital of the new state. His relatives gave trouble, and in the same year his kinsman, Sultan Pasha, exasperated by the arrest in his house of a suppliant who had attempted to murder Gen. Gouraud and was seeking asylum, revolted with his retainers. Next year he was amnestied after some skirmishing. In Sept. 1923 Salim died, and the Druse council, which had not been constitutionally elected but appointed by private understanding among the lords, could not agree concerning the election of a governor, and unconstitutionally elected Capt. Carbillat the French adviser to the Druse state as their provisional governor.

War with France.—In Prof. Toynbee's words (Toynbee, *Survey of International Affairs*, vol. 1, pp. 412-413, 1925), the new governor, while sincere, disinterested and energetic, was "tyrannical in his methods and psychologically blind to a degree which made it inevitable that his well-meant efforts should end in disaster." He filled the treasury, supplied the country with roads, schools, irrigation channels, reservoirs, and justices of the peace, founded a museum, and in the autumn of 1924 gave effect to Article 4 of the de Caix Agreement by conducting elections for a new council, which promptly violated Article 3 of the agreement by electing him as the regular governor. Capt. Carbillat's policy was directed against the chiefs, notably the Turshun, but his strict imposition of forced labour and of a rigid system of passes, and his imprisonment of recalcitrants, who were occasionally incarcerated in his coal-cellar, exasperated the peasantry.

In April 1925 Druse delegates waited on Gen. Sarraïl, the new French high commissioner in Syria, to complain of their governor, and to point out that his election was a violation of the de Caix Agreement. The general brusquely dismissed them, and subsequently stated in writing that he repudiated the agreement. Meanwhile the governor went on leave. His French locum tenens warned Sarraïl of the growing excitement among the Druses and was dismissed. Druse petitions remained unheard, and another delegation was rebuffed. On July 11 Gen. Sarraïl ordered his delegate at Damascus to summon the Druse "conspirators" on the pretext of receiving their demands" and then hold them as hostages. Three confiding notables appeared, and were exiled to Palmyra. On July 20 Sultan Pasha rebelled, and having surprised and defeated a small French force next day, invested Suwayda on July 22. Gen. Sarraïl made light of the revolt, and on Aug. 2-3 a column 3,000 strong, comprising some unreliable colonial troops, was attacked near Azra' while marching to relieve Suwayda, and lost its transport, most of its guns, and more than a quarter of its men. A general Druse rising followed.

The rebels promptly established contact with the pro-Sherifian elements in Damascus and with the nationalist and anti-French "People's Party." Its leader Dr. A. Shabbandar, and other chiefs

fled to the Druses to avoid arrest, and early in September proclaimed a "National Syrian Government." The French repulsed a Druse raid on Damascus on Aug. 24 and relieved Suwayda a month later, but were unable, owing to transport difficulties, to force the Sultan to a general action. The retreats that followed their advances encouraged the hostile Muslim elements in their rear, and the revolt in Damascus and the bombardment of the city (Oct. 13-20) marked the beginning of the Syrian Nationalist revolt, the history of which is narrated elsewhere (See SYRIA, *Modern History*). During this unequal struggle the Druses proved themselves far better fighters than the Muslim insurgents, and they were the last to submit. At one moment they seemed likely to inflict a grave disaster upon the French. The Hermon Druses joined the revolt late in Sept. 1925, Zaydu'l Atrash son of the Sultan came to their aid, surprised Hasbaya on the night of Nov. 9-10, and prepared to invade the Lebanon, where he expected to be joined by the local Druses and the Shah Muslims (Matawilah) of the Sidon hinterland. The heroic defence of Hasbaya by a handful of troops saved the situation, and French reinforcements cleared the Hermon region in December. Thenceforward the Hauran Druses fought a losing battle. Abdu'l Ghaffar Al Atrash and other chiefs opened negotiations with Gen. Andrea in Oct. 1926, which ended after some months in their surrender on honourable terms. The Leja was conquered in the spring of 1927, and Sultan, who had established a camp at Qasru'l Azraq in the British mandatory territory of Transjordan, was compelled by British armoured cars and Transjordanian police to withdraw into Ibn Sa'ud's desert dominions with the remnant of his followers, and their families. He settled at Qurayyatul-Milh in the Wadi Sirhan with, perhaps, 500 families, who were well received by the Wahabi Ling, though a lasting friendship between the "Puritans of Islam" and the non-Muslim Druses seems improbable. Col. Clement Grandcourt was appointed governor of the Hauran in 1927 and the French military chiefs, who respected Druse valour, did their best to restore good relations.

Customs.—The Hauran Druses have some of the vices and all the virtues of oriental mountaineers. They are intelligent, self-respecting, and hospitable, but cruel and, by Western standards, treacherous. The women enjoy much consideration, polygamy is forbidden, and they join the men in religious functions. Divorce may be initiated by the wife. The veil is obligatory, some Druse women, indeed, will not unveil in the presence of a foreign woman. Feminine dress is black, with red slippers. The men usually wear a black under-robe with white gridle, and a white roll round the red fez, which is now almost the sole distinguishing mark of the Lebanon Druses. (For religious observances see above.)

RELIGION

Druses, a term for the Muwahhidin (Unitarians), as the Druses call themselves, who believe that there is one and only one God, indefinable, incomprehensible, ineffable, passionless. He has made himself known to men by successive incarnations, of which the last was Häkim, the sixth Fatmide caliph. How many these incarnations have been is stated variously, but 70, one for each period of the world, seems the best-attested number. Jesus appears to be accepted as one such incarnation, but not Muhammad. No further incarnation can now take place in Häkim, a final appeal was made to mankind, and after the door of mercy had stood open to all for 26 years, it was finally and for ever closed. When the tribulation of the faithful has reached its height, Häkim will reappear to conquer the world and render his religion supreme. Druses, believed to be dispersed in China, will return to Syria. The combined body of the Faithful will take Mecca, and finally Jerusalem, and all the world will accept the Faith. The first of the creatures of God is the Universal Intelligence or Spirit, impersonated in Hamza, Häkim's vizier. This Spirit was

the creator of all subordinate beings, and alone has immediate communion with the Deity. Next in rank, and equally supporting the throne of the Almighty, are four Ministering Spirits, the Soul, the Word, the Right Wing and the Left Wing, and beneath these again are spiritual agents of various ranks. The material world is an emanation from, and a "mirror" of, the Divine Intelligence. The number of human beings admits neither of increase nor of decrease, and a regular process of metempsychosis goes on continually. The souls of the virtuous pass after death into ever new incarnations of greater perfection, till at last they reach a point at which they can be re-absorbed into the Deity itself, those of the wicked may be degraded to the level of camels or dogs. All previous religions are mere types of the true, and their sacred books and observances are to be interpreted allegorically. The Gospel and the Qur'an are both regarded as inspired books, but not as religious guides. The latter function is performed solely by the Druse Scriptures. As the admission of converts is no longer permitted, the faithful are enjoined to keep their doctrine secret from the profane, and in order that their allegiance may not bring them into danger, they are allowed to make outward profession of whatever religion is dominant around them. To this latter indulgence is to be attributed the apparent indifference which leads to their joining Muslims in prayers and ablutions, or sprinkling themselves with holy water in Maronite churches. Obedience is required to the seven commandments of Hamza, the first and greatest of which enjoins truth in words (but only those of Druse speaking with Druse), the second, watchfulness over the safety of the brethren, the third, absolute renunciation of every other religion, the fourth, complete separation from all who are in error, the fifth, recognition of the unity of "Our Lord" in all ages, the sixth, complete resignation to his will, and the seventh, complete obedience to his orders. Prayer, however, is regarded as an impertinent interference with the Creator, while, at the same time, instead of the fatalistic predestination of Islam the freedom of the human will is distinctly maintained. Not only is the charge of secrecy rigidly obeyed in regard to the alien world, but full initiation into the deeper mysteries of the creed is permitted only to a special class designated 'Aqls (Arabic 'Aql, intelligence), in contradistinction from whom all other members of the Druse community, whatever may be their position or attainments, are called Jähls, the Ignorant. About 15% of the adult population belong to the order of 'Aqls. Admission is granted to any Druse of either sex who expresses willingness to conform to the laws of the society, and during a year of probation gives sufficient proof of sincerity and stability of purpose. There appears to be no formal distinction of rank among the various members. Exceptional influence depends upon exceptional sincerity or ability. All are required to abstain from tobacco and wine, the women used not to be allowed to wear gold or silver, or silk or brocade, but this rule is commonly broken now, and although neither celibacy nor retirement from the affairs of the world is either imperative, or customary, unusual respect is shown to those who voluntarily submit themselves to ascetic discipline. The 'Aqls are distinguished by the wearing of a white turban, emblematic of the purity of their life. Their food must be purchased with money lawfully acquired, and lest they should unwittingly partake of any that is ceremonially unclean they require those Jähls, whose hospitality they share, to supply their wants from a store set apart for their exclusive use. The ideal 'Aql is grave, calm and dignified, with an infinite capacity of keeping a secret, and a devotion that knows no limits to the interests of his creed. On Thursday evening, the commencement of the weekly day of rest, the members of the order meet together in the various districts, probably for the reading of their sacred books and consultation on matters of ecclesiastical or political importance. Their meeting-houses, *khalwas*, are plain, unornamented edifices, in which the women assemble at the same time as the men, a part of the space being fenced off for them by a semi-transparent black veil. It has been frequently asserted that the image of a calf is kept in a niche, and traces of phallic and gynaeocratic worship have been vaguely suspected, but there is no authentic information in support of either state-

ment, and it is certain that the sacred books of the religion contain moral teaching of a high order on the whole.

As a formulated creed, the Druse system is not a thousand years old. In the year A.D. 996 (386 A.H.) Häkim Bismilläh (i.e. he who judges by the command of God), sixth of the Fatimite caliphs (third in Egypt), began to reign, he believed that he held direct intercourse with the deity, or even that he was an incarnation of the divine intelligence, and in A.D. 1016 (407 A.H.) his claims were made known in the mosque at Cairo, in 1017 (408 A.H.) the new religion found a successful apostle in the person of Hamza ibn 'Ali ibn Ahmad, a Persian mystic, who became Häkim's vizier, gave form and substance to his creed, and by an ingenious adaptation of its various dogmas to the prejudices of existing sects, finally enlisted an extensive body of adherents. In 1020 (411 A.H.) the caliph was assassinated, but it was given out by Hamza that he had only withdrawn for a season, and his followers were encouraged to look forward with confidence to his triumphant return.

It is possible, even probable, that the segregation of the Druses as a people dates only from the adoption of Hamza's creed. But when it is recalled that other inhabitants of the same mountain system, e.g., the Maronites, the Ansariëh, the Metawäli and the Isma'ilites, also profess creeds which, like the Druse system, differ from Sunni Islam in the important feature of admitting incarnations of the Deity, it is impossible not to suspect that Hamza's emissaries only gave definition and form to beliefs long established in this part of the world. Many of the fundamental ideas of Druse theology belong to a common West Asiatic stock, but the peculiar history of the Mountain is no doubt responsible for beliefs, held elsewhere by different peoples, being combined there in a single creed. Some allowance, too, must be made for the probability that Hamza's system owed something to doctrines, Christian and other, with which the metropolitan position of Cairo brought Fatimite society into contact.

(See *Encyclopaedia of Islam*, ii, 255.)

DRUSUS, MARCUS LIVIUS, Roman statesman, was colleague of Gaius Gracchus in the tribuneship, 122 B.C. The proposal of Gracchus (q.v.) to confer the full franchise on the Latins had been opposed not only by the senate but also by the mob, whose privileges would thereby be diminished. Drusus threatened to veto the proposal. Encouraged by this, the senatorial party put up Drusus to oppose Gracchus. Gracchus had proposed to found colonies abroad, Drusus provided twelve in Italy, to each of which 3,000 citizens were to be sent. Gracchus had proposed to distribute allotments to the poorer citizens subject to a state rent charge, Drusus promised that they should be free, and inalienable. In addition to the franchise, immunity from corporal punishment (even in the field) was promised the Latins. The absence of Gracchus, and the inefficiency of his representative at Rome, led to the acceptance of these proposals, which were never intended to be carried. Drusus himself declined all responsibility in connection with carrying them out. He was rewarded for his services by the consulship (112), and the title of *patronus senatus*. He received Macedonia for his province, and he was the first Roman general to reach the Danube. He is possibly the Drusus mentioned by Plutarch as having died in 110, the year of his censorship.

See Appian, *Bell. Civ.* i, 23, Plutarch, *Gaius Gracchus*, 8-11, Florus in 4, A.H.J. Greenidge, *Hist. of Rome*, vol. 1 (1904).

MARCUS LIVIUS DRUSUS, son of the former, tribune of the people in 91 B.C. was a man of high integrity and recognized the need of reform. At that time an agitation was going on for the restoration of the judicial functions from the *equites* to the senate, Drusus proposed as a compromise a measure which restored to the senate the office of *iudices*, while its numbers were doubled by the admission of 300 *equites*. Further, a special commission was to be appointed to try all *iudices* guilty of taking bribes. But the senate was lukewarm, and the *equites* offered violent opposition. In order, therefore, to catch the popular votes, Drusus proposed the establishment of colonies in Italy and Sicily and an increased distribution of corn at a reduced rate. By help of these riders the bill was carried. Drusus then sought a closer alliance with the Italians, promising them the long coveted boon of the Roman franchise.

The senate broke out into open opposition. His laws were abrogated as informal, and each party armed its adherents for the civil struggle which was inevitable. Drusus was murdered, and his assassin was never discovered.

See *Rome History*, also Appian, *Bell. Civ.* 1, 35; Florus III, 17; Dio Cassius, *Annals*, vol. 1, 13; Livy, *Epit.* 70; Vell. Pat. II, 13.

DRUSUS, NERO CLAUDIUS (38–9 B.C.), Roman general, son of Tiberius Claudius Nero and Livia Drusilla, stepson of Augustus and younger brother of the emperor Tiberius. In 13 B.C. in conjunction with Tiberius he subdued the Raeti and Vindelici. The credit of the decisive victory, however, must be assigned to Tiberius. (See Horace, *Odes* IV, 4 and 14.) In 13 B.C. Drusus was sent as governor to the three Gauls, where discontent had been aroused by the exactions of the Roman governor Iulius. Drusus made a fresh assessment for taxation purposes, and summoned the Gallic representatives to a meeting at Lugdunum to discuss their grievances. It was important to pacify the Gauls, in order to have his hands free to deal with the German tribes one of which the Sugambri, on the right bank of the Rhine, had seized the opportunity, during the absence of Augustus, to cross the river (12). Drusus drove them back and pursued them to their own territory, which he devastated. Sailing down the Rhine he subdued the Frisii and, in order to facilitate operations against the Chauci, dug a canal (Fossa Drusiana) leading from the Rhenus (Rhine) to the Isala (Yssel) into the lacus Flevis (Zuider Zee) and the German ocean. Making his way along the Frisian coast, he conquered the island of Burchum (*Borkum*), defeated the Bructeri in a naval engagement on the Amisia (*Ems*), and went on to the mouth of the Visurgis (*Weser*) to attack the Chauci. On the way back his vessels grounded on the shallows, and were only got off with the assistance of the Frisii.

In his second campaign (11), Drusus defeated the Usipetes, threw a bridge over the Luppia (*Lippe*), attacked the Sugambri and advanced to the Weser, where he defeated the Cherusci. While making his way back he fell into an ambush but managed to defeat his enemy. In view of future operations, he built two forts, one at the junction of the Luppia and Aliso (*Aime*), the other in the territory of the Chatti on the Taunus, near Moguntiacum (*Mainz*).

The third campaign (10) was of little importance, and, after some insignificant successes, Drusus returned to Rome, and was elected consul for the following year.

In 9 B.C. he defeated the Chatti, Suebi, Marcomanni and Cherusci, and penetrated as far as the Albis (*Elbe*). Here trophies were set up to mark the farthest point ever reached by a Roman army. To secure the conquered territory, fortresses were erected along the Elbe, Weser and Maas (*Meuse, Moselle*), a flotilla was placed upon the Rhine, and a dam built upon the right arm of its estuary to increase the flow of water into the canal mentioned above. On his return, his horse threw him, and he died thirty days after the accident (Sept. 14). The body was carried to the winter quarters of the army, whence it was escorted by Tiberius to Rome, the procession being joined by Augustus at Ticinum (Pavia). Tiberius delivered the funeral oration.

Drusus was one of the most distinguished men of his time. His agreeable manners, handsome person and brilliant military talents gained him the affection of the troops, while his liberal principles endeared him to the people. He married Antonia, the daughter of Marcus Antonius the triumvir, by whom he had three children: Germanicus, adopted by Tiberius; Claudius, afterwards emperor, and a daughter Livilla.

The chief ancient authorities for the life of Drusus are Dio Cassius, the epitomes of Livy, Suetonius (*Claudius*), Tacitus (*Portions of the Annals*), Florus (whose chief source is Livy), Velleius Paterculus and the *Consolato ad Liviam*. The German campaigns were described in the last books of Livy and the lost *Bella Germaniae* of the elder Pliny. They have produced an extensive literature, in Germany, J. Asbach's "Die Feldzüge des Nero Claudius Drusus" (*Rhein Jahrb.* lxxv, 14–30) being especially recommended; see also Mommsen's *History of the Roman Provinces*, I, 1, Mervale, *History of the Romans under the Empire*, ch. 36, A. Stein in Pauly-Wissowa's *Realencyclopädie* (1899), where other authorities are given, J. C. Tarver, *Tiberius the Tyrant* (1902).

7—C.

DRUSUS CAESAR (c. 15 B.C.–A.D. 23), commonly called Drusus junior, to distinguish him from his uncle Nero Claudius Drusus, was the only son of the Emperor Tiberius. He was consul elect in A.D. 14, and on the accession of Tiberius was sent to put down a mutiny of the troops in Pannonia (Tacitus, *Annals*, I, 24–30). As governor of Illyricum (17 A.D.), he set the Germanic tribes against one another. On his return Drusus was consul a second time (21 A.D.) and in the following year received the tribunician power which indicated his heir to the throne. Seianus, who also aspired to the supreme power, determined to remove Drusus. He seduced Drusus's wife and persuaded her to assist him in murdering her husband. A slow poison was administered, from the effects of which Drusus died after a lingering illness. Drusus was a man of violent passions, but not entirely devoid of better feelings, as is shown by his undoubtedly sincere grief at the death of Germanicus.

BIBLIOGRAPHY.—Tacitus *Annals*, vol. I, 76, vol. IV, 8–11; Dio Cassius, vol. IV, 14, 14; Suetonius *Tiberius*, 62; J. C. Tarver *Tiberius the Tyrant* (1902).

DRYADES or **HAMADRYADES**, in Greek mythology nymphs of trees and woods. It is sometimes said by late authors that a dryad is a nymph who lives among trees (Gr. *δρῦς*, tree, especially oak), a hamadryad the spirit of a tree, living and dying with it.

DRYANDER, JONAS CARLSSON (1748–1810), Swedish botanist, born at Gothenburg on March 3, 1748, was educated at Gothenburg Lund and at Uppsala under Linnaeus. He visited England in 1782 and became librarian to Sir Joseph Banks. He was librarian to the Royal society and to the Linnean society, of which he was one of the founders in 1788. He was vice-president of the society from 1794 till his death in London Oct. 19, 1810. Besides various papers, Dryander published *Dissertationes graduales hucusque regno vegetabilis vindexans* (Lund, 1776) and *Catalogus bibliothecae historico naturalis Josephi Banksi, Bart.* 5 vol. (London, 1796–1800), and edited Aiton's *Hortus Kewensis* and Roxburgh's *Plants of the Coast of Coromandel*.

DRYBURGH ABBEY, a monastic ruin southwest of Berwickshire, Scot., on the Tweed river, about 5 mi. southeast of Melrose. The abbey occupies the spot where, about A.D. 522, St. Modan, an Irish monk, established a sanctuary. Founded in the middle of the 12th century, it prospered until 1372, when it was partially destroyed by the English under Edward II. It suffered again at the hands of Richard II in 1385, and was reduced to ruin during the expedition of Edward Seymour earl of Hertford, in 1544.

After the Reformation, the estate was erected into a temporal lordship, and in 1604 James VI gave it to John Erskine, 2nd earl of Mar. In 1700 the abbey lands belonged to Thomas Haliburton, Sir Walter Scott's great grandfather, but an extravagant grand-uncle became bankrupt and had to part with the property. It reverted to a branch of the Erskines in 1786, when it was acquired by the 11th earl of Buchan. Lord Glenconner later purchased it, and in Jan. 1918 he gave it to the nation.

At mid 20th century a number of the monastic buildings were represented by fragments. The church was originally 140 ft. long and 75 ft. wide at the transepts. Remains include the west front, the east aisle of the north transept, called St. Mary's Aisle, parts of the south transept and segments of the choir and nave. Scott was buried in St. Mary's Aisle on Sept. 26, 1832. His tomb is a plain block of polished Peterhead granite, inscribed only with his name and the dates of his birth and death.

DRY CLEANING Dry cleaning is the process of cleaning wearing apparel, household furnishings and other articles made of wool, silk, rayon and related fabrics. Dirt, stains and spots are removed by the chemical action of organic solvents and special detergents, as contrasted with laundering in soap and water.

Striving with crude hand methods and uncertain results, the technique of dry cleaning was developed to a high technological degree of efficiency, speed and safety to fabrics.

Formerly, dry cleaning was done with petroleum solvents (naphtha, Stoddard solvent, etc.). Initial cost was low but fire hazards were ever-present.

The modern trend favors dry cleaning with synthetic solvents,

such as carbon tetrachloride, trichlorethylene, perchlorethylene and blends of chlorinated hydrocarbons. Most of the spots and stains on cloths are oily. These solvents dissolve oils, greases, waxes and tars almost instantly, partly because of their low surface tension and high wetting power. Other properties make these cleaning fluids useful: they are nonflammable, they leave garments free from odour, they have high volatility, they permit rapid drying, they do not injure or shrink the most delicate fabrics, their low boiling points permit ease in reclaiming, and they impart a lustre and soft feel to garments.

When a load of dirty clothing is placed in the dry-cleaning machine, the solvent dissolves much of the soil at once, while insoluble dirt particles are loosened from the fibres. Insoluble soil consists largely of lint, earth, dust, ashes, carbon particles and face powder. By a continuous flow of solvent through the fine openings in the fabric, loosened dirt is flushed out, washed free to the surface of the fabric and passed into suspension in the solvent. Remaining insolubles require later treatment by special soaps and spotting agents. All the contaminated solvent must be rinsed out to obtain good results. The clothes can be only as clean as the solvent used in the final rinse. By means of a proper reclaimation system, suspended and dissolved impurities are removed from the solvent by processes of filtration, clarification and distillation. Although the amount of soil in garments varies widely, the average is approximately 0.8% by weight. One thousand pounds of garments leave about eight pounds of sludge.

Some stains are water soluble and call for wet cleaning in a washing machine.

The dry cleaner's skill is applied in spotting. In this process stains are diagnosed and removed by application of specific chemicals, steam, scraping with a bone spatula or dry brushing. The quality of dry cleaning depends on the effectiveness of spotting techniques. Finishing includes many varied operations: the dry cleaner must sew on buttons, do minor tailoring repairs, press the garment so that it resumes its original lines, shape, drape and appearance, bring up the nap by steam, hand iron fragile silks, etc.

The modern dry cleaning plant requires high pressure steam and many intricate and highly specialized machines and appliances. A partial list of equipment includes marking machines, washers, stills, pumps, extractors, dry tumblers, wind whips, blow dryers, drying cabinets, presses, puff irons, scrub and steam tables, sleeves, glove units, steam irons, bagging and assembling racks and sewing machines. Special utility presses in assorted shapes are used for the finishing of different types of garments. The total investment in machinery is substantial.

In 1950 the U.S. department of commerce (census of business) reported a total of \$1,300,000,000 of dry-cleaning business for the year, or \$8.70 dry-cleaning sales per capita for the country. From 1939 to 1950 the increase of dry-cleaning volume had showed a phenomenal growth. In 1950 there were in the U.S. 28,000 dry-cleaning plants, with an investment in equipment of \$750,000,000.

The small press shops receive garments from customers, send them to large wholesale dry-cleaning plants for actual cleaning and upon their return remove spots, do minor repairs and press the garments. Small independent press shops flourish in the larger cities.

During and after World War II a significant development was the rapid growth of chain-store cleaners. These companies operate large-scale, mechanized cleaning plants, reach their customers through company owned neighbourhood stores, and sell the service at low prices on a cash-and-carry basis. They obtain their profits through great volume handled in mass production.

The retail dry cleaner operates his own plant, serving customers through "drive-in," stores or delivery routes. The National Institute of Cleaning and Dyeing, Silver Spring, Md., was founded in 1907, to serve member dry-cleaning firms with technical bulletins, scientific garment analyses, field and engineering service and management courses. It established research laboratories and a model plant and dry-cleaning school with students enrolled from many countries of the world.

(V. K. J.)

DRYDEN, JOHN (1631-1700), English poet, born at Ald-

winkle, in Northamptonshire, of a family with Puritan and anti-monarchical leanings, was educated at Westminster school under Richard Busby, and at Trinity college, Cambridge where he took his degree in 1654. In that year his father died, leaving him a small estate worth about £60 a year, and he seems to have remained in Cambridge another three years before establishing himself in London, where he is said to have lived in the house of his publisher, Herrington, with whom he was connected until 1679, when Jacob Tonson became his publisher.

He had written some elegant and commendatory verses while he was at school, but the first work which showed the measure of his genius was the *Heroic Stanzas* (1659) to the memory of Oliver Cromwell. This is a fine tribute to the Protector, and shows Dryden as a disciple of John Donne indeed, but as a direct student of the Latin classics. With the coronation of Charles II Dryden, the hereditary Puritan and the panegyrist of the Protector hailed the new order in his *Astraea Redux* (1660), followed by a *Panegyric on the Restoration* (1661).

For a livelihood Dryden turned to the stage. Having failed with a tragedy on the fate of Henry, duke of Guise, he turned to comedy, for which he admitted he had little taste. The age demanded comedies, and he endeavoured to supply the kind of comedy that the age demanded. His first attempt was unsuccessful. He then wrote *The Wild Gallant*, acted in Feb. 1663, by Thomas Killigrew's company in Vere street. Peppys showed good judgment in pronouncing the play "so poor a thing as ever I saw in my life." Dryden never learned moderation in his humour, but he took a lesson from the failure of *The Wild Gallant*, his next comedy *The Rival Ladies*, produced before the end of 1663, and printed in the next year, as correctly described by Peppys as "a very innocent and most pretty witty play." But he never quite conquered his tendency to extravagance. *The Assignment, or Love in a Nunnery*, produced in 1673, was another failure, and even in 1680, after 20 years' experience to guide him, *The Kind Keeper, or Mr. Limberham*, was prohibited after three representations as being too indecent for stage presentation.

The undisciplined force of the man carried him to an excess from which more dexterous writers held back. After the production of *The Rival Ladies* in 1663, Dryden assisted Sir Robert Howard in the composition of a tragedy in heroic verse *The Indian Queen*, produced with great splendour in Jan. 1664. Its success, one of the greatest since the reopening of the theatres, was largely due to the magnificent scenic accessories—the battles and sacrifices on the stage, the spirits singing in the air, and the god of dreams ascending through a trap. Dryden followed it up with *The Indian Emperor, or the Conquest of Mexico by the Spaniards*, acted in 1665. Immediately after the success of *The Indian Queen*, in the preface to an edition (1664) of *The Rival Ladies*, Dryden took up the question of the propriety of rhyme in serious plays. Rhyme was not natural, some people had said, to which he answered that it is as natural as blank verse, and that much of its unnaturalness is not the fault of the rhyme but of the writer. Rhyme at once stimulates the imagination, and prevents it from being too discursive in its flights.

In 1668 he published his *Essay of Dramatick Poesie*. The essay takes the form of a dialogue between Neander (Dryden), Eugenius (Charles, Lord Buckhurst, afterward earl of Dorset), Crites (Sir R. Howard) and Lisideus (Sir C. Sedley), who is made responsible for the definition of a play as a "just and lively image of human nature, representing its passions and humours, and the changes of fortune to which it is subject, for the delight and instruction of mankind." Dryden's form is of course borrowed from the ancients, and his main source is the critical work of Corneille in the prefaces and discourses contained in the edition of 1660, but he was well acquainted with the whole body of contemporary French and Spanish criticism. Crites maintains the superiority of the classical drama, Lisideus supports the exacting rules of French dramatic writing, Neander defends the English drama of the preceding generations, including, in a long speech, an examination of Ben Jonson's *Silent Woman*. Neander argues, however, that English drama has much to gain by the observance of exact methods of construction without abandoning entirely

the liberty which English writers had always claimed. He then goes on to defend the use of rhyme in serious drama. How did he argue against the use of rhyme in a "preface" to *Four New Plays* (1665), which had furnished the excuse for Dryden's essay Howard replied to Dryden's essay in a preface to *The Duke of Lerna* (1668). Dryden at once replied in a masterpiece of sarcastic retort and vigorous reasoning, *A Defence of an Essay of Dramatique Poésie*, prefixed to the second edition (1668) of *The Indian Emperor*. It is the ablest and most complete statement of his views about the employment of rhymed couplets in tragedy.

Before his return to town at the end of 1666, when the theatres (which had been closed during the disasters of 1665 and 1666) were reopened, Dryden wrote a poem on the Dutch war and the Great Fire entitled *Annus Mirabilis* (ptd. 1667). The poem is in quatrains, the metre of his *Heroic Stanzas* in praise of Cromwell, which Dryden chose, he tells us, "because he had ever judged it more noble and of greater dignity both for the sound and number than any other verse in use amongst us." From the reopening of the theatres in 1666 till Nov. 1681, the date of his *Absalom and Achitophel*, Dryden produced nothing but plays. The stage was his chief source of income. *Secret Love, or the Maiden Queen*, a tragic comedy, produced in March 1667, was based on an episode in the *Artamene, ou le Grand Cyrus* of Mlle de Scudéry, the historical original of the "Maiden Queen" being Christina, queen of Sweden. His next play *Sir Martin Mar-all, or the Feigned Innocence*, an adaptation in prose of the duke of Newcastle's translation of Molière's *L'Étourdi*, was produced at the Duke's theatre, without the author's name, in 1667. It was about this time that Dryden became a retained writer under contract for the King's theatre, receiving from it £300 or £400 a year, till it was burned down in 1672, and about £200 for six years more till the beginning of 1678. His co-operation with Davenant in a new version (1667) of Shakespeare's *Tempest* (for his share in which Dryden can hardly be pardoned on the ground that the chief alterations were happy thoughts of Davenant's, seeing that he affirms he never worked at anything with more delight) must also be supposed to be anterior to the completion of his contract with the Theatre Royal. He was engaged to write three plays a year, and he contributed only 10 plays during the 10 years of his engagement, finally exhausting the patience of his partners by joining in the composition of a play for the rival house. Comedies produced by him in this period are *An Evening's Love, or the Mock Astrologer*, an adaptation from *Le Feste Astrologue* of the younger Corneille, produced at the King's theatre in 1668, *Ladies à la Mode* (1668), *Marriage à la Mode* (1671), *The Assignation, or Love in a Nunnery* (1673), *The Kind Keeper, or Mr Limberham* (1678), but only *Marriage à la Mode* was really successful.

While Dryden met with such indifferent success in his willing efforts to supply the demand of the age for low comedy, he struck upon a really popular and profitable vein in heroic tragedy. *Tyrannic Love, or the Royal Martyr*, a Roman play dealing with the persecution of the Christians by Maximian, was produced in 1669. It is in rhymed couplets, but the author again did not trust solely for success to them; for, besides the magic incantations, the singing angels, and the view of Paradise, he made Nell Gwyn, who had stabbed herself as Valena, start to life again as she was being carried off the stage, and speak a riotous epilogue, in violent contrast to the serious character of the play. *Almansor and Almahide, or the Conquest of Granada*, a tragedy in two parts, was written in 1669 to 1670. This piece seems to have given the crowning touch of provocation to the wits, who ridiculed the popular taste for these extravagant heroic plays. *The Rehearsal* (1671) written by the duke of Buckingham, with the assistance, it was said, of Samuel Butler, Martin Clifford, Thomas Sprat and others, was a severe and just punishment for Dryden's boast in the epilogue to the second part of *The Conquest of Granada* of the superiority of Restoration comedy over that of the Elizabethan age. Davenant was originally the hero, but on his death in 1668 the satire was turned upon Dryden, who is ridiculed under the name of Bayes, the name being justified by his appointment in 1670 as poet laureate and historiographer to the king (with a pension of £300 a year and a butt of canary wine). It is said that *The Rehearsal*

was begun in 1663, but this probably only means that Buckingham and his friends had resolved to burlesque the extravagant heroics of *The Indian Queen*. Later Dryden fully avenged himself on Buckingham by his portrait of Zimri in *Absalom and Achitophel*. His immediate reply is contained in the preface "Of Heroic Plays" and the "Defence of the Epilogue," printed in the first edition (1672) of his *Conquest of Granada*.

His next tragedy *Amboyna* (1673), put on the stage to inflame the public mind in view of the Dutch war, was written, with the exception of a few passages, in prose, and those passages in blank verse. An opera which he wrote in rhymed couplets, called *The State of Innocence, and Fall of Man*, an attempt to turn part of *Paradise Lost* into rhyme, as a proof of its superiority to blank verse, prefaced by an "Apology for Heroique Poetry and Poetique Licence," was entered at Stationers' hall in 1674, and printed in 1677, but never acted. Dryden praises his original as "undoubtedly one of the greatest, most noble and most sublime poems which either this age or nation has produced." He is said to have had the elder poet's leave "to tag his verses." In *Aurengzebe*, which was Dryden's last, and also his best rhymed tragedy, he borrowed from contemporary history, for the Great Mogul was still living. In the prologue he confessed that he had grown weary of his long loved mistress rhyme and retracted, with characteristic frankness, his disparaging contrast of the Elizabethan with his own age. But the stings of *The Rehearsal* had stimulated him to do his utmost to justify his devotion to his mistress, and he claims that *Aurengzebe* is "the most correct" of his plays. It was entered at Stationers' hall and probably acted in 1675, and published in the following year.

After the production of *Aurengzebe* Dryden seems to have reconsidered the principles of dramatic composition, and to have made a particular study of the works of Shakespeare. The fruits of this appeared in *All for Love, or the World Well Lost*, a version of the story of Antony and Cleopatra, produced in 1678, which must be regarded as a very remarkable departure for a man of his age, and a wonderful proof of undiminished openness and plasticity of mind. In his previous writings on dramatic theory, Dryden, while admiring the rhyme of the French dramatists as an advance in art, did not give unqualified praise to the regularity of their plots, he was disposed to allow the irregular structure of the Elizabethan dramatists, as being more favourable to variety both of action and of character. But now, in frank imitation of Shakespeare, he abandoned rhyme, and, if we might judge from *All for Love*, and the precepts laid down in his "Grounds of Criticism in Tragedy," prefixed to *Troilus and Cressida* (1679), the chief point in which he aimed at excelling the Elizabethans was in giving greater unity to his plot. He upheld still the superiority of Shakespeare to the French dramatists in the delineation of character, but he thought that the scope of the action might be restricted, and the parts bound more closely together with advantage. *All for Love* and *Antony and Cleopatra* are two excellent plays for the comparison of the two methods. Dryden gave all his strength to *All for Love*, writing the play for himself, as he said, and not for the public. The action of his play takes place wholly in Alexandria, within the compass of a few days, it does not, like Shakespeare's, extend over several years, and present incessant changes of scene. Dryden chooses, as it were, a fragment of a historical action, a single moment during which motives play within a narrow circle, the culminating point in the relations between his two personages. He devotes his whole play, also, to those relations, only what bears upon them is admitted. In Shakespeare's play we get a certain historical perspective, in which the love of Antony and Cleopatra appears in its true proportions beneath the firmament that overhangs human affairs. In Dryden's play this love is our universe, all the other concerns of the world retire into a shadowy, indistinct background. If we rise from a comparison of the plays with an impression that the Elizabethan drama is a higher type of drama, taking Dryden's own definition of the word as "a just and lively image of human nature," we rise also with an impression of Dryden's power such as we get from nothing else that he had written since his *Heroic Stanzas* 20 years before.

It was 12 years before Dryden produced another tragedy worthy of the power shown in *All for Love*. *Don Sebastian* was acted and published in 1690. In the interval he wrote *Oedipus* (1679) and *The Duke of Guise* (1683) in conjunction with Nathaniel Lee, *Troilus and Cressida* (1670), *The Spanish Friar* (1681), *Albion and Albanius*, an opera (1685), *Amphitruon* (1690). In *Troilus and Cressida* he follows Shakespeare closely in the plot, but the dialogue is rewritten throughout, and not for the better. The versification and language of the first and the third acts of *Oedipus*, which with the general plan of the play were Dryden's contribution to the joint work, bear marked evidence of his recent study of Shakespeare. *The Duke of Guise*, in which he used one scene from his earliest dramatic attempt, provided an obvious parallel with contemporary English politics. Henry III was identified with Charles II, and Monmouth with the duke. The lord chamberlain refused to license, it until the political situation was less disturbed. The plot of *Don Sebastian* is more intricate than that of *All for Love*. It has also more of the characteristics of his heroic dramas, the extravagance of sentiment and the suddenness of impulse remind us occasionally of *The Indian Emperor*, but the characters are much more elaborately studied than in Dryden's earlier plays, and the verse is slowly and powerfully. It would be difficult to say whether *Don Sebastian* or *All for Love* is his best play; they share the palm between them. Dryden's subsequent plays are not remarkable. Their titles and dates are *King Arthur*, an opera (1691), for which Purcell wrote the music, *Cleomenes* (1692), *Love Triumphant* (1691).

Soon after Dryden's abandonment of heroic couplets in tragedy, he found new and more congenial work for his favourite instrument in satire. As usual the idea was not original to Dryden, though he struck in with his majestic step and energy divine, and immediately took the lead. The pioneer was Mulgrave in his *Essay on Satire*, an attack on Rochester and the court, which was circulated in ms. in 1679. Dryden himself was suspected of the authorship, and he may have given some help in reviving it, but it is not likely that he attacked the king on whom he was dependent for the greater part of his income, and Mulgrave in a note to his *Art of Poetry* (1717) expressly asserts Dryden's ignorance. Dryden, however, was attacked in Rose street, Covent Garden, and severely cudgelled by a company of ruffians who were generally supposed to have been hired by Rochester. Toward the close of 1681 Dryden took the field as a satirist on the side of the court, at the moment when Shaftesbury, baffled in his efforts to exclude the duke of York from the throne as a Papist, and to secure the succession of the duke of Monmouth, was waiting his trial for high treason. *Absalom and Achitophel* produced a great stir. Nine editions were sold in rapid succession in the course of a year. There was no compunction in Dryden's ridicule and invective. Delicate wit was not one of Dryden's gifts, the motions of his weapon were sweeping, and the blows hard and trenchant. The advantage he had gained by his recent studies of character was fully used in his portraits of Shaftesbury and Buckingham, Achitophel and Zimri. In a play produced in 1681 (*The Spanish Friar*) he had written on the other side, gratifying the popular feeling by attacking the Roman Catholic priesthood.

Three other satires followed *Absalom and Achitophel* one of them hardly inferior in point of literary power. *The Medal*, a *Satire against Sedition* (March 1682) was written in ridicule of the medal struck to commemorate Shaftesbury's acquittal. Then Dryden had to take vengeance on the literary champions of the Whig party who had opened upon him with all their artillery. Their leader, Shadwell, had attacked him in *The Medal of John Bayes*, which Dryden answered in Oct. 1682 by *Much Ado About Nothing*. To the second part of *Absalom and Achitophel* (Nov. 1682), written chiefly by Nahum Tate, he contributed a long passage of invective against Robert Ferguson, one of Monmouth's chief advisers, Eleanora Settle, Shadwell and others. *Rehearsal*, which appeared in the same month, though nominally an exposition of a layman's creed, and deservedly admired as such, was not without a political purpose. It attacked the Papists but declared

the "fanatics" to be still more dangerous.

Dryden's next poem in heroic couplets was in a different strain. On the accession of James II. in 1685, he became a Roman Catholic. There has been much discussion as to whether this conversion was or was not sincere, but it is worth while to notice that in his earlier defense of the English Church he exhibits a desire for the definite guidance of a presumably infallible creed, and the case for the Roman Church brought forward at the time may have appeared convincing to a mind singularly open to new impressions. At the same time nothing can be clearer than that Dryden always regarded his literary powers as a means of subsistence, and had little scruple about accepting a brief on any side. *The Hind and the Panther*, published in 1687, is an ingenious argument for Roman Catholicism, put into the mouth of "a milk white hind, immortal and unchanged." Prior and Montagu, the future earl of Halifax, ridiculed it in *The Hind and the Panther transversed to the story of the Country Mouse and the City Mouse*. Dryden's other literary services to James were a savage reply to Stillingfleet (who had attacked two papers published by the king) and a translation of a life of Xavier in prose. He had written also a panegyric of Charles I. *Threnodia Augustalis* (1685), and a poem in honour of the birth of James II.'s heir, under the title of "Britannia redi vna" (1688).

Dryden did not abjure his new faith on the Revolution, and so lost his office and pension as laureate and historiographer royal. His rival Shadwell reigned in his stead. Dryden was once more thrown mainly upon his pen for support. He turned again to the stage and wrote the plays already enumerated. In the last decade of his life his translations from the classics occupied much of his attention. *Ovid's Epistles translated* appeared in 1680, and numerous translations from Virgil, Horace, Ovid, Lucretius and Theocritus appeared in the four volumes of *Miscellaneous Poems—Miscellaneous Poems* (1684), *Sylvae* (1685), *Examen poeticum* (1693), *The Annual Miscellany* (1694) by the "most eminent hands", in 1693 was published the verse translation of the *Satires* of Juvenal and of Persius by "Mr. Dryden and several other eminent hands," which contained his "Discourse concerning the Origin and Progress of Satire", and in 1697 Jacob Tonson published his most important translation, *The Works of Virgil*. The book, which was the result of three years' labour, was a vigorous, rather than a close, rendering of Virgil into the style of Dryden. Among other notable poems of this period are the two "Songs for St Cecilia's Day," written for a London musical society for 1687 and 1697, and published separately. The second of these is the famous ode on "Alexander's Feast." The well known paraphrase of *Veni, Creator Spiritus* was printed in the *Examen Poeticum*, and his "Ode to the memory of Anne Killigrew," called by Dr Johnson the noblest ode in the language, was written in 1686.

His next work was to render some of Chaucer's and Boccaccio's tales and Ovid's *Metamorphoses* into his own verse. These translations appeared in 1700, a few months before his death, and are known by the title of *Fables, Ancient and Modern*. The preface, which is an admirable example of Dryden's prose, contains an excellent appreciation of Chaucer, and, incidentally, an answer to Jeremy Collier's attack on the stage. Thus a large portion of the closing years of Dryden's life was spent in translating for bread. Besides, his three sons held various posts in the service of the pope at Rome, and he could not well be on good terms with both courts. However, he was not molested by the government and in private he was treated with the respect due to his age and his admitted position as the greatest of living English poets. He held a small court at Wills's coffeehouse, where he spent his evenings, here he had a chair by the fire in winter and by the window in summer, Congreve, Vanbrugh and Addison were among his admirers, and here Pope saw the old poet of whom he was to be the most brilliant disciple. He died at his house in Gerard street, London, on May 1, 1700 and was buried on the 13th of the month in Westminster Abbey. Dryden's portrait, by Sir G. Kneller, is in the National Portrait gallery.

BIBLIOGRAPHY.—*The Comedies, Tragedies and Operas written by John Dryden, Esq.* (1702) was published by Tonson, who also issued

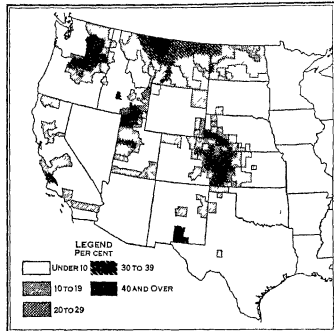

the poet's *Dramatic Works* (1717) edited by Congreve. *Poems on Various Occasions and Translations from Several Authors* (1701), also published by Tonson was very incomplete and although other editions followed there was no satisfactory collection until the edition of the *Works* (1808, 2nd ed. 1871) by Sir Walter Scott, who supplied historical and critical notes with a life of the author. This is revised and corrected by G. Saintsbury (1881-93), still is regarded as the standard edition, but John Sargeant issued an edition with introduction and textual notes in 1910. His *Critical and Miscellaneous Prose Works* (1806) were edited by Edmund Malone, who collected industriously the materials for a life of Dryden. Convenient partial modern editions are the *Poetical Works* (1890), edited by W. D. Christie with an excellent "life." *The Best Plays of John Dryden* ("Mermaid Series") edited by G. Saintsbury, and *Essays of John Dryden* (1900), edited by W. P. Ker. Besides the critical and biographical matter in these editions see Johnson's *Lives of the Poets*, G. DRY DOCK see DOCKS

DRY FARMING Dry farming is farming without irrigation in areas where the moisture supply is the chief limitation to crop production. Such farming practices have existed approximately as long as man has been an agriculturist, particularly as subsistence farming on desert margins and in areas having dry

are given more space. Primitive races in many lands have made use of wide plant spacings to help avoid failure of maize and sorghums.

Dry farming of the commercial sort, whether of the family farm or bonanza size, illustrates the most modern large scale, highly capitalized and mechanized agriculture. Special implements have been developed, not only adapted to extensive farming, but designed to keep the surface weed free, water absorbent and yet resistant to wind erosion. Net agricultural incomes per hour of labour in good years are

BY COURTESY OF U. S. DEPARTMENT OF COMMERCE
CULTIVATED SUMMER FALLOW AS A PERCENT OF TOTAL U. S. CROPLAND 1949 DATA FOR 17 WESTERN STATES

particularly of wheat, barley and grain sorghums.

Efficient dry farming consists of making the best use of a limited water supply by storing in the soil as much of the rainfall as is possible and by growing adapted crop plants by the methods that make the best use of this moisture. Storing water is accomplished by main-

among the highest, yet fixed costs are high and the risk is such as to emphasize the desirability of such adaptation to income uncertainty as is possible, whether by insurance and credit improvements or diversification involving livestock and some irrigation agriculture where possible.

DRY ICE is the trade name for solid carbon dioxide, a dense, snowlike substance having a temperature of -78.5°C or lower. Carbon dioxide gas is changed to a liquid when subjected to a pressure more than five times that of the ordinary atmosphere and at -57°C . When this liquid is allowed to expand rapidly from the high pressure to atmospheric pressure, carbon dioxide snow results. This snow is compressed into cakes. Instead of melting, it evaporates to a dry gas that has no corrosive action if moisture free. It makes possible the shipping of perishable products (mats, ice cream) long distances. One pound of dry ice will absorb a little less than twice as much heat as one pound of water ice. A block of dry ice 10 in. x 10 in. x 10 in. weighs about 45 lb.

DRYNESS, CHEMICAL There are many instances recorded in chemical literature where it appeared that a trace of water must be present in order for a reaction to proceed with measurable velocity. Usually the experiments were not conducted with sufficient care so that quantitative statements could be made as to the amount of water present, and any conclusion that in the absence of small quantities of water a reaction would not take place at all, should not be accepted without further investigation. However, it is well established that water is a catalyst for many reactions, and as is commonly the case with reactions which are subject to catalysis, the reaction proceeds so slowly in the absence of the catalyst that it is difficult to say

and destruction of weeds. The ideal surface, to absorb water and prevent wind and water erosion, is one that is free from live weeds but has enough clods or dead vegetable matter to hinder runoff and prevent erosion. Cultivation that controls weeds is generally sufficient to maintain such a surface condition, but loosening a packed surface is sometimes necessary. The depth of plowing has little to do with

heat and drought conditions are not severe. They may either be crops that are planted in fall or early spring and mature in time to miss much of the hot part of summer or those that are planted late and make much of their growth after the period of greatest summer heat has passed. Crops adapted to dry farming are usually smaller in stature and quicker in maturing than those grown under more humid conditions. Planting rates are also generally lower and the individual plants

whether it is taking place at all. Thus, it had been reported that the combination of gaseous hydrogen chloride and ammonia would not take place in the absence of water. W. H. Rodush and J. C. Michalek (1929) found that when the gases are intensively dried, there is a considerable lag in reaching equilibrium. On the other hand, there is no evidence that equilibrium was not reached or that when reached, proportions of the various constituents present were different from what they would have been in the presence of water vapour.

Hence it may be concluded that water plays an important role as a catalyst in many reactions, and when powerful drying agents such as phosphorus pentoxide are employed, the amount of water present may be reduced to a point where the reaction does not appear to take place. The explanation for the activity of the water molecule as a catalyst is to be found in its polar character and its tendency to form addition compounds through hydrogen bonding with other molecules including those of water itself. The action of moisture in promoting the corrosion of iron is familiar to everyone.

On the other hand there is no confirmation for the conclusion that the properties of pure substances such as liquid benzene are profoundly affected by the intensive drying. It is true that the total vapour pressure of liquid benzene will be markedly increased by the solution of small amounts of water, but the increase will be strictly proportional to the quantity of water added.

By far the most important action of small quantities of water is in the form of surface films. If a solid material contains polar atoms such as oxygen, then water molecules will be attached to these atoms by hydrogen bonds, and other water molecules will be attached to these first molecules until a continuous film is formed, one or more molecules thick. In the case of glass the water molecules not only form surface films but penetrate some distance below the surface. Glass fibres when first drawn have a hard, smooth surface and great tensile strength, but after being exposed to the atmosphere, moisture penetrates the surface and weakens the fibre. Likewise, when it is desired to produce a high vacuum in a glass vessel, a prolonged heating and baking out is required to drive the moisture out of the walls.

The insulating power of dielectrics is adversely affected by adsorbed films of moisture. Fused quartz is an excellent insulator so far as electrical conduction through the body of the material is concerned, but the adsorbed layer of moisture on the surface dissolves carbon dioxide and other gases from the air to give a conducting surface layer. To be effective at high relative humidity, insulators must be made of materials which do not contain polar atoms which would attract a surface layer of moisture.

DRY POINT, Though generally classed as a variety of etching, and in practice often combined with that process, dry point is, strictly speaking, a kind of engraving.

In etching the needle scratches only through the etching ground and exposes the surface of the plate, the latter is then placed in a bath of acid, and it is the chemical action of the acid that eats out in the copper a line of sufficient depth to hold printing ink. In dry point, on the contrary, as in line engraving, the lines are hollowed out by the tool itself in direct contact with the copper, as directed by the engraver's hand, without the intervention of any chemical action. Zinc can be used instead of copper, but work on this metal wears out quickly under the pressure of the

printing press. Celluloid plates have been used but no heat can be applied during the inking and printing of the plates.

Methods—The "div" point, so called because no bath of acid supplements its use, is a tapering pointed instrument of steel, of stronger build than the point or needle used by the etcher and sometimes sharpened at both ends, but many modern engravers have substituted for steel a diamond point, or more rarely a ruby. With one of these instruments the engraver works directly upon a plate of hard and polished copper, either shiny or blackened, or merely dimmed with grease, plowing up a line shallow or deep, according to the amount of pressure used. Along one edge of this line if the point is slanting, or along both edges if it is held upright, a raised edge of copper is turned up by the tool, and this ridge is termed the "burr." The burr, when the plate is inked for printing, becomes clothed with ink and produces in the impression the rich, soft and velvety effect which constitutes the peculiar charm of a dry-point proof. If the burr is removed (as it easily can be, should the engraver desire it with a scraper) the somewhat thin line thus produced is less easily distinguished, except by a practised eye, from the characteristic lines produced by the burin or the etching point. The burr is delicate and is easily worn out, either by too vigorous wiping with rag or muslin when the plate is inked or by too great pressure in the printing press. In any case the burr does not last long and the "bloom" of the early proofs of a dry point soon wears off. The first two or three proofs, though they may be rough and uneven, often have a charm which can never be replaced by the more even printing of the bulk of the edition, and at some stage, it may be after a dozen proofs, or 20 or 50, according to the manipulation of the plate and the depth to which the lines have been sunk, deterioration inevitably becomes noticeable, unless the plate has been protected from wear by steel facing. Some engravers assert that this precaution in no way affects the beauty of the proofs, and of some dry-point plates this may be true. But most engravers and most collectors are of the opinion that there is an appreciable difference and that, according to H. W. Singer, "a trained eye can distinguish between the good, warm impressions taken from the copper and the hard, cold ones, taken from the plate after it has been steelled."

There can be no doubt that dry points printed from the steel-faced plate for book illustration, such as Andre Dunoyer de Segonzac's illustrations to *Les Croix de bois* by R. Dorgeles (1921), can all sustain comparison with the few artist's proofs taken before the steel facing. In fact the process is thoroughly unsuitable for any purpose that requires the production of a large edition printed with mechanical regularity, and the dry point yields its essential charm only in the hands of a sensitive and conscientious printer—none is better than the artist himself, if he understands the art of printing also—who knows when to stop at the moment when the plate begins to show signs of wear, and does not feel bound to fulfil a contract by delivering a certain number of proofs, whether the plate will bear it or not. The dry point, more than any other process of engraving, needs to be under the direct control, at every stage, of the artist who has invented the design to which he feels this process, rather than another, to be appropriate.

Corrections—Two advantages which the dry-point process offers to the original etcher are the power which he possesses when using it of seeing exactly what he is doing with his tool upon the plate, and the comparative ease with which he can make alterations if he changes his mind or requires to correct a fault. Lines already made can be almost entirely obliterated with the burnisher or worked over with other lines, whereas in etching such alterations can be effected only by the much more difficult operation of laying a new ground. To quote E. S. Lumsden, "Corrections are very easily made in dry point, because so little metal is removed from the surface, the strength depending principally upon the upturned ridges. This means that the sides of the lines are comparatively easily closed up by pushing them together with the burnisher. If the passage is to be reworked with heavy strokes, there is no difficulty at all, but if the original surface has to be recovered in order to print a clean

tone from it, considerable labour is often needed to erase the scratches altogether as under heavy pressure the faintest indications of a line will show up in the proof. With care and patience anything can be done, and the freshness of the surface kept intact."

The comparative ease with which changes can be made results, in the case of some modern original artists whose work is done in dry point, in a multiplicity of states. Of a celebrated dry point by Sir Murdoch Bone, "A Spanish Good Friday," there are no less than 39 states, the engraver having repeatedly changed his mind about some detail, or thought of a fresh improvement that he could introduce, after he had begun to take proofs.

Dry Point and Etching.—Dry point has sometimes been used by line engravers, instead of etching to which they far more frequently resort, in the first preparatory stage (outline) of plates which are subsequently to be finished with the burin. The French line engravers of the 18th century made a regular practice of producing first states in pure etching. Much more usual is the combination of dry point with etching. Such a combination may be made either for the general enrichment of an etched plate, in a second or subsequent state by the addition of the dry point burr, or for the sake of introducing small corrections. Corrections to an etched plate can be made far more easily (though less permanently) by a few touches with the dry point than by an additional biting of the plate, involving as this does the stopping out or laying of a fresh ground. Dry point additions to an etching can be readily distinguished by a trained eye in early impressions, but they can wear away gradually in the course of the printing till almost every trace of them is lost. It is the presence of the clearly visible dry-point work, lending richness where it was intended, that confers value on such an etching as the second state of Rembrandt's "Hundred Guilder" print, or the only state of his "Christ Healing the Sick." Yet these rich early impressions and the bare looking late ones after the worn plate has lost its dry point burr have, it should be remembered, to be described as impressions of the same state.

HISTORY

In a retrospect of the use of pure dry point during the centuries which have elapsed since the invention of engraving, it will appear that its popularity has been intermittent, and that there have been prolonged periods during which, in one country or another, if not in all countries, it has quite fallen out of favour.

Earliest Work.—Its first appearance is earlier than that of etching, for there can be no doubt that the scarce and valuable prints of the "Master of the Hausbuch," a painter-engraver who worked in western Germany (probably on the middle Rhine) about 1480, were produced with the dry point or possibly with the burin used in the same way, so as to scratch the surface of the copper and throw up a burr, which was not scraped away. This engraver is also called the "Master of the Amsterdam Cabinet" from the fact that the largest collection of his prints, numbering about 80 in all, is in that collection, but the name is to be deprecated, since it suggests that he was a Dutchman. He was a very original artist and a keen observer of nature, with a technique quite unlike that of any other 15th century engraver.

Dürer.—The next engraver whom we find employing dry point is Albrecht Dürer, who resorted to this process only in or about the year 1512, and probably abandoned the experiment when he discovered how few good proofs a plate engraved in this manner could yield. There are only three dry points by Dürer, "The Man of Sorrows," 1512 (Bartsch 21, Dodgson 65), "St. Jerome Seated Near a Pollard Willow," 1512 (Bartsch 59, Dodgson 66), and its companion print, the undated "Holy Family" of similar dimensions (Bartsch 43, Dodgson 67). Of the two latter dry points very few good impressions are extant, for the burr wore off rapidly, and the majority of extant specimens were taken from the worn-out plates. Of Dürer's first work in this technique, "St. Jerome," two proofs only exist of a first state before the monogram (in the British Museum, and the Albertina, Vienna). These are of superb quality, the Albertina impression of the second state is also very fine indeed. A fourth dry point, "St. Veronica"

(Bartsch 64), dated 1510, which figures in the older catalogues as one of the great rarities in Dürer's work, for only two impressions are known, is discredited, for it was proved to be a copy of an unsigned woodcut published at Nuremberg in a *Salus Animae* of 1503. Hans Sebald Beham alone of the followers of Dürer used dry point, and that but sparingly. It is hardly found again in the history of German engraving until a much later date.

Italy.—In Italy also the process was used in early times, chiefly by Andrea Schiavone, or Meldola (1522-82), an engraver who worked at Venice, and perhaps also by the monogrammist H.E., for early impressions of his prints show signs of burr which in the usual later prints would not be suspected.

Rembrandt.—In the Netherlands dry point was hardly used if at all, before the 17th century. Its varied uses, as described above, for the enrichment of the etched plate by the addition of burr to the etched line as well as for the production of pure dry points were first discovered and exploited by the greatest of all painter etchers, Rembrandt, who in his middle period, from about 1639 onward, used this technique increasingly, in a thoroughly personal manner for the sake of substituting "colour" and warmth for the drier effect of the pure etchings of his earlier period. From 1640-50 Rembrandt used dry point extensively for retouching his etched plates—"The Death of the Virgin" and the "Hundred Guilder" print are examples taken from the beginning and close of this period—while in his last period (1650-61), plates wrought wholly in dry point became more and more frequent. Among the finest of these must be reckoned "The Goldweaver's Field" (1651), "The Vista" (1652), the two large plates, "The Three Crosses" and "Christ Presented to the People," of 1653 and 1655, respectively and the "Portrait of Arnold Tholinx," 1656. An impression of the exceedingly rare first state of this portrait, in the Rudge collection, sold at auction in Dec. 1924, realized the large sum of 3,600 guineas, the highest price hitherto paid at an auction for an etching, if not for a print of any kind.

The 18th Century.—After Rembrandt, no very considerable use of the dry point was made by any of the great engravers for a lengthy period. The 17th century was in all countries an age of line engraving and etching, while in the Low Countries, Germany and England, the invention and development of mezzotint were claiming attention. In the 18th century dry point was used here and there by a number of painter etchers, amateurs in their technique as compared with the professional engravers, who found the medium congenial and probably took hints in their use of it from their study of Rembrandt. A beautiful example of such an 18th century dry point is the portrait of himself, dated 1739, by Arthur Pond (reproduced, *Print Collector's Quarterly*, 1922, ix, 324). One of the little subjects illustrating the destruction by fire of the *Forre de Saint Germain* in 1762, by Gabriel de St. Aubin, is a dry point which seems in its modernity a precursor of the 19th century. In the period which preceded what is known as "the revival of etching," that is to say, during the first half of the 19th century, several English and Scottish etchers produced dry points of remarkable merit. Among these were D. C. Read, of Salisbury (1790-1821), E. T. Daniell, of Norwich (1804-42) and especially the two Scottish painter-etchers Andrew Geddes (1783-1844) and Sir David Wilkie (1785-1841). Of the last two, catalogues describing all the states of their plates with reproductions of five specimens will be found in the 5th and 11th publications of the Walpole Society, 1917 and 1923, while a revised and improved catalogue of both artists, by C. Dodgson, forms the 15th publication (1936) of the Print Collectors' Club. Geddes' "Portrait of the Artist's Mother," his "Peckham Rye," and some other landscapes, and Wilkie's one pure dry point, "The Lost Receipt" are of conspicuous merit if compared with the dry points of any period. The French etcher, Charles Jacque, also produced, long before 1850 a number of dry-point landscapes, with figures or horses, of great beauty.

Modern Work.—The etchers of the "revival," both in France and England, soon brought the dry point, as well as etching, into renewed favour. In the hands of Sir Francis Seymour Haden it yielded masterpieces like "Windmill Hill" and "Sunset in Ire-

DRY QUENCHING is a process of cooling a hot solid substance without using a liquid in direct contact with the substance to be quenched. The sensible heat in most of the cases can thereby economically be converted into useful energy and the quality of the product improved. This process has been applied and developed primarily for the quenching of coke as it is discharged from coke ovens at temperatures of 1,800° to 2,000° F. It was for a long time common practice to sprinkle this hot coke with water or to submerge it in water to reduce its temperature sufficiently to prevent it from re-igniting and to facilitate handling and transportation. This method, however, has several disadvantages. The coke takes up water thereby considerably reducing its heating value. The wet quenching vapours are corrosive and affect steel and concrete construction, thereby largely increasing maintenance costs. They also carry coke dust high into the air and scatter it widely over the plant and the community.

Methods.—In the Sulzer system, the process of dry quenching of the hot coke is accomplished by circulating an inert mixture of gases in a closed cycle, first through the hot coke mass where the gases extract the sensible heat, thence through a steam boiler where the hot gases transfer the heat to the water in the boiler and convert it into steam. The cooled gases leaving the boiler are discharged back to the fan and again forced through the coke.

The hot coke is conveyed to the dry quencher in more or less regular intervals depending upon the schedule of discharge of the coke ovens. It is introduced through the top door of the coke container which holds a number of loads. Before a new load of coke is charged an equal amount of cooled coke is withdrawn from the bottom of the apparatus. The coke, therefore, is allowed to remain in the container for several hours gradually reaching lower cooling zones. The cooling gas is circulated by means of a fan continuously operating and flows through the coke mass in an upward direction thereby performing the cooling in accordance with the counterflow principle.

The inert mixture of gas is formed when starting up the plant. A small portion of coke is converted into a mixture of carbon monoxide and carbon dioxide whereby the oxygen of the air within the system is completely consumed. The cooling gas therefore consists mainly of these products of combustion and nitrogen. Care must be taken that two doors are never open at the same time in order to prevent air entering the system causing combustion of coke. As long as only one door is open at a time, the pressure in the system adjusts itself to atmospheric pressure at that point, but no gas is pushed out nor air sucked in. However, on discharging cooled coke an equal volume of air enters the system.

Advantages.—The principal benefit in dry quenching is the production of 400 to 500 lb of steam per 1,000 lb of coke quenched, this representing a saving that equals 25 to 40% of the fuel required to carbonize the coal. The steam may be used in the by-product plant or for generating of power which may either cover the needs of the plant or be fed into the lines of a power company.

blast furnaces foundry cupolas and domestic furnaces is the benefit resulting from the use of dry quenched coke. Breeze from this coke can still be considered as a high quality fuel, while wet quenched coke breeze due to high moisture is very likely to cause trouble in furnace operation. The dry quenching process may also be adapted for the purpose of cooling other hot products of the chemical industry such as calcium carbide, lime, cement clinker, etc., saving the sensible heat and improving the quality of the product. (H. D. S.)

DRY ROT, a term applied to the decay of wood caused by various kinds of fungi. Frequently the term is applied solely to such decay as takes place in timber that has been worked or is in actual use. The present article deals solely with dry rot in this restricted sense. The fungi fed upon the wood and thus cause it to become lighter in weight, weaker, more brittle and less elastic, so that when struck the wood emits a muffled sound and readily snaps. In more advanced stages, rot of the wood is apt to warp and may show cracks ("cross shakes") at right angles to the grain and can greedily absorb liquids, e.g., water, and, comparatively early, the wood may show discolourations and lose its characteristic scent.

The fungi causing dry rot belong to the great class that includes the familiar toadstools and mushrooms. They are composed of very slender, hollow, jointed, closed tubes (*hyphae*) which grow in length and emit branches. These tubes permeate the wood, and outside this may also produce loose mould like coatings, or by interweaving can give rise to denser shreds, nets, strings or more massive fruit-bodies shaped like cakes, brackets or mushroom rooms.

The fruit bodies, which are easily visible to the naked eye, eject myriads of microscopic infectious germs, termed spores. But spores are likewise produced by certain species of these fungi quite apart from the fruit-bodies.

Infection of wood may also take place by means other than by spores. Certain species of fungi, including the most malignant causal agent of dry rot in houses in Europe, *Merulius lacrymans* (*domesticus*), not only grow inside the wood but can more rapidly spread over its surface, and advance over non-wooden surfaces, and, in the form of strings penetrate or perforate brick walls, attacking wood that they reach. Contrasting with such *contagious* species are other merely *infectious* species that usually live only in the interior of the wood until they thrust their fruit bodies outside it, such internal decay is often difficult to detect, as the superficial wood may be quite sound and normal in appearance.

Wood may be protected against dry rot by one or both of two methods: (1) sanitation, (2) antiseptic (fungicidal) treatment.

Sanitation.—Sanitation is the cheapest method of preventing, and sometimes of arresting, dry rot. One essential condition for activity is a sufficient supply of air, as these fungi absorb oxygen and give out carbonic acid and water. Although they can grow in the absence of oxygen, they are readily killed by an accumulation of carbon dioxide. During respiration certain species of fungi can produce water so vigorously that dry wood is thoroughly moistened and drops of water appear on the fungus itself (hence the specific name of *Merulius lacrymans*).

An adequate supply of water is required by the fungus which owes the main part of its weight to water and cannot take in food unless this be dissolved in water. So far as dry rot in temperate regions is concerned, in the dry air of deep coal pits and of warmed rooms wood may last for decades or centuries, whereas dry rot is common in moist, shallower coal pits, in most cellars and damp ground-floors, especially can it appear near escapes of water from water pipes or steam pipes, and in stuffy, feebly ventilated places, for instance under floors covered with linoleum. In a house fungus causing dry rot may be luxuriant on the hidden faces of floor boards, panels and skirting boards, but be entirely lacking on the visible faces of these in contact with drier air of rooms, so that dry rot may be widespread through a building although no fungus be visible until the wood work is disturbed.

Fungi causing dry rot cannot attack wood that is either too wet or too dry. Some species demand much moisture, among such

are *Comophora cerebella* (whose slender black threads are common on the surface of damp wood in houses) and a number of fungi that do not grow over the surface of the wood. These species are probably largely responsible for "wet rot," a popular term apparently applied to discoloured wood showing to the naked eye no fungus inside or outside the wood, no external cross-shakes, but giving evidence of weakness and possibly former or present wetness (which caused the decay and disappearance of any fungus formerly outside the wood).

Other fungi, including *Merulius lacrymans*, produce considerable amounts of water and, transporting this, can thus moisten distant wood, thus they can feed on drier wood.

Where dry rot in a building is caused by fungi demanding much moisture, it may be arrested by merely cutting off the excessive supply of water, this will not suffice when *Merulius lacrymans* is the causal agent. Moreover cutting off the excess of moisture does not necessarily cause death of the fungus inside the wood when wood attacked by *Merulius* or when certain internal feeders have been thoroughly dried for months, the fungus inside the wood may awaken into activity if the wood be remoistened.

Arrangements to secure a house against excess of dampness include erection on a light pervious soil, provision of efficient dampcourses, care against absorption or condensation of water by and on the walls, under the ground floor, adequate ventilation and provision of a water tight coating over the concrete, obviation of leakage or overflow from rain water pipes and gutters outside the house, and water pipes and steam pipes indoors, proper construction of window casements to allow water to flow properly away from them, renewal of put on external wood work, and adequate maintenance of the roofing.

Fungi causing dry rot are active only within certain ranges of temperature, but inasmuch as the temperatures prevailing in all parts of a building, from cellar to roof, in temperate regions at times enable these fungi to be active, temperature from the practical point of view intervenes only as a means of eradication. Low temperatures (for instance the freezing point of water) at least in the case of *Merulius lacrymans* do not suffice to kill fungus or spores. Higher temperatures (over 50° C.) are much more effective so that infected wood can be sterilized by heat, especially by steam, at temperatures below the boiling point of water. A painter's lamp suffices to sterilize infected surfaces, but an oxy acetylene flame, or some equivalent, is required for rapid sterilization of walls permeated with fungi causing dry rot.

Antiseptic (Fungicidal) Treatment—The decay of wood can be combated by the application of disinfectants and especially by substances that are powerful fungicides.

Among organic wood-preservatives the most familiar is so called creosote oil ("creosote oil") which is very widely used out of doors to preserve railway sleepers, paving blocks, telegraph poles, etc. Its scent is too powerful and persistent to permit of its use indoors, so that in houses, etc., "creosote" is often replaced by some what similar preservatives from which the more volatile and strong scented oils have been removed. Extremely powerful organic fungicides suitable for use on wood are dimethylphenol and sodium dimethylphenate, to which are added other substances, such as sodium fluoride, designed to render the mixture non-explosive. On the other hand carbolic acid and formalin are too evanescent, and many other disinfectants used to destroy bacteria causing disease are too weak in action on fungi to act as timber preservatives.

Among aqueous solutions of inorganic salts used to preserve wood are copper sulphate (which attacks iron), zinc chloride (which easily washes out and when too warm or strong destroys wood), corrosive sublimate (very poisonous), sodium fluoride, and acid (commercial) magnesium silico fluoride (which attacks metals and glass). Of these inorganic salts the last two may be generally regarded as the best for use in houses.

It is generally true that with increasing depth of penetration of the preservative into the wood the greater is the durability conferred, but the more costly is the process of treatment. Out doors the preservative (usually "creosote") is driven deep

into thick pieces of timber (such as sleepers, poles or paving-blocks) by pneumatic pressure or by immersion in hot tanks. Whereas wood work in buildings is usually merely coated with the preservative, reliance being more economically based upon sanitation including proper methods of construction. (P Gt.)

DRY TORTUGAS, a group of 10 coral islets or keys 65 m west of Key West, Florida. The largest are East Key, Bird Key and Loggerhead. Fort Jefferson, the site of a military prison during the Civil War, is a quarantine station. Loggerhead has a Carnegie laboratory of marine biology. The group forms a Federal bird reservation.

DUAL IGNITION *see* INTERNAL COMBUSTION ENGINES

DUALISM In metaphysics, dualism postulates the eternal coexistence of mind and matter, as opposed to monism both idealistic and materialistic. Two forms of this dualism are held. It is said that (1) mind and matter are absolutely heterogeneous, thus making any causal relation between them *ex hypothesi* impossible, (2) there is a hypothetical dualism, so that mind cannot bridge over the chasm so far as to know matter *in itself*, though it is compelled by its own laws of cause and effect to postulate matter as the origin, if not the cause, of its sensations. It follows that, for the thinking mind, matter is a necessary hypothesis. Hence the theory is a kind of monism, inasmuch as it confessedly does not assert the existence of matter save as an intellectual postulate for the thinking mind. Matter, in other words, must be assumed to exist, though mind cannot know it *in itself*. From this question there emerges a second and more difficult problem. Consciousness, it is held, is of two main kinds, sensation and reason. Sensation alone is insufficient to explain all our intellectual phenomena, *all sensation is momentary and individual (cf. EMPIRICISM)*. How then are we to account for memory and the principles of necessity, similarity, universality? It is argued that there must be in the mind an enduring, primary faculty whereby we retain, compare and group the presentations of sense. This faculty is *a priori*, transcendental, and entirely separate from all the data of experience and sense-perception. Here then we have a dualism within experience. The mind is not to be regarded as a sensitized film which automatically records the impressions of the senses. It contains within itself this co-ordinating power which reacts upon and arranges the sense-given presentations.

In Ethics and Theology—In the domain of morals, dualism postulates the separate existence of Good and Evil, as principles of existence. In theology the appearance of dualism is sporadic and has not the fundamental, determining importance which it has in metaphysics. It is a result rather than a starting point. The old Zoroastrianism, and those Christian sects (e.g., Manichaeism) which were influenced by it, postulate two contending deities Ormuzd and Ahriman (Good and Evil), which war against one another in influencing the conduct of men. So, in Christianity, the existence of Satan as an evil influence, antagonistic to God, involves a kind of dualism. But generally speaking this dualism is permissive, inasmuch as it is always held that God will triumph over Satan in His own time. So, in Zoroastrianism, the dualism is not ultimate, for Ahriman and Ormuzd are represented as the twin sons of Zervana Akarana, i.e., limitless time, wherein both will be finally absorbed. The postulate of an Evil Being arises from the difficulty, at all times acutely felt by a certain type of mind, of reconciling the existence of evil with the divine attributes of perfect goodness, full knowledge and infinite power. John Stuart Mill (*Essay on Religion*) preferred to disbelieve in the omnipotence of God rather than forgo the belief in His goodness. It follows from such a view that Satan is not the creation of God but rather a power coeval in origin, over whose activity God has no absolute control.

In Christology—Dualism is also used in a special theological sense to describe a doctrine of the Nestorian heresy. According to this doctrine the personality of Christ is twofold, the Divine Logos dwells as a distinct personality in the man Jesus Christ, the union of the two natures being analogous to the relation between the believer and the indwelling Holy Spirit.

History of Metaphysical Dualism—The earliest European thinkers (*see* IONIAN SCHOOL OF PHILOSOPHY) endeavoured to

reduce all the facts of the universe to a single material origin, such as Fire, Water, Air. It is only gradually that there appears any recognition of a spiritual principle exercising a modifying or causal influence over inert matter. Anaxagoras was the first to postulate the existence of Reason (*voûs*) as the source of change and progress. Yet even he did not conceive this Reason as in corporeal, it was in reality only the most highly rarefied form of matter in existence. In Plato for the first time we find a truly dualistic conception of the universe. Asserting that Ideas alone really exist, he yet found it necessary to postulate a second principle of not being, the groundwork of sensuous existence and of imperfection and evil. Herein he identified metaphysics and ethics combining the good with the truly existent and evil with the non-existent. Aristotle rebels against this conception and substitutes the idea of *πρωτη ύλη* and development. Nevertheless he does not escape from the dualism of Form and Matter, *voûs* and *ύλη*. The scholastic philosophers naturally held dualistic views resulting from their extreme devotion to formalism. This blind dualism found its natural consequence in the revolt of the Renaissance thinkers, Bruno and Paracelsus, who asserted the unity of mind and matter in all existence and were the precursors of the more intelligent monism of Leibniz and the scientific metaphysics of his successors. The birth of modern physical science from the other hand in the investigations of Bacon and Descartes obscured the metaphysical issue by the predominance of the mechanical principles of natural philosophy. They attempted to explain the fundamental problems of existence by the unaided evidence of the new natural science. Thus Descartes maintained the absolute dualism of the *res cogitans* and the *res extensa*. Spinoza realized the flaw in the division and preferred to postulate a single substance (*unica substantia*) of which mind and matter are ultimate attributes, while Leibniz explained the universe as a harmony of spiritual or semispiritual principles. Kant practically abandons the problem. He never really establishes a relation between pure reason and things in themselves (*Dinge an sich*), but rather seeks refuge in a dualism within consciousness, the transcendental and the empirical. Since Kant there are, therefore, two streams of dualism, dealing, one with the radical problem of the relation between mind and matter, the other with the relation between the purely rational and the empirical elements within consciousness. To the first problem one answer commonly given is that matter in itself is inherently unthinkable and comes within the vision of the mind only as an intellectual presentation, so that philosophy is in a sense both dualist and monist, it is a cosmic dualism inasmuch as it admits the possible existence of matter as a hypothesis, though it denies the possibility of any true knowledge of it, and is hence with regard to the only possible knowledge an idealistic monism. It is a self-destructive dualism, a confessedly one-sided monism, agnostic as to the fundamental problem. To the second problem there are two main answers, that of Associationism which denies to the mind any *a priori* powers and asserts that sensation is the only source of knowledge, and that which admits the existence of both transcendental and empirical knowledge.

DUALITY. A statement capable of two different meanings, both of them true, one obtained from the other, by simply interchanging two words, is an illustration of the principle of duality. An important application of the principle is found in projective geometry. In the plane this is accomplished by interchanging the words "point" and "line"; it is well illustrated by the theorem of Pappus, which may be stated as follows:

Given any two straight lines u, u' in the plane, choose any three points A, B, C on u , and any three points A', B', C' on u' . The three points of intersection $AB', A'B, AC', A'C, BC', B'C$ lie on a straight line u'' . The dual theorem is:

Given any two points U, U' , draw any three lines a, b, c through U and a', b', c' through U' . The three lines joining the points $ab', a'b; ac', a'c; bc', b'c$ all pass through a point U'' . If the first

proof has been established, the second follows by duality, since the determining elements of lines in terms of points are identical with those of points in terms of lines. The principle was first recognized by Poncelet in the *Journal fur Mathematik* (1839) and by Gergonne in the *Annales de Mathematiques pures et appliquees* (1825-27), and first generally applied by Steiner in his *Systematische Entwicklungen*, (1833.)

In geometry of three dimensions there is a corresponding duality between points and planes. In this case the line is self dual, as it is determined by any two distinct points on it or by any two distinct planes through it.

FIG 2

through A, B, O . After this has been done for every line, think of the point O being removed from the plane. The resulting system of incomplete circles furnishes a non-euclidean interpretation of plane geometry. The line sphere transformation of Lie is an illustration of a complete duality between lines and spheres in space. Much of higher geometry is concerned with the principle of duality, every new application practically doubles the extent of existing knowledge. (See PROJECTIVE GEOMETRY.)

DUALIA, one of the principal negro peoples of Cameroonian territory, west Africa. (See CAMEROONS.)

DUAL ORGANIZATION. A distinctive feature in the social structure of certain simple communities is their division into two complementary sections which have important functions in the social and ceremonial life of the people. This system of dual organization occurs most typically in many parts of Australia, Melanesia and N. America, and has been recorded from India and Assam, its existence elsewhere has not been definitely established. The two sections, usually termed moieties or phratries, are unilateral in character, membership being determined by descent through either the father or the mother. In Melanesia matrilineal descent predominates, elsewhere both matrilineal and patrilineal descent are common. An exceptional case is found among the Fox and Kuckapoo of N. America, where the father usually, but not always, determines which moiety his child shall enter, so that often the first-born child will belong to one moiety and the next child to the other. The structure of the moieties also varies in some communities they are simple undivided groups, in others they are each composed of a number of smaller sub-divisions or clans, e.g., among the Winnebago of N. America, where the one moiety consists of 28 clans and the other of 26.

Functions.—The dual organization is very frequently connected with the regulation of marriage. In most communities the moieties are exogamous, and consequently a man belonging to one moiety must always marry a woman belonging to the other. This feature is sometimes regarded as the distinctive characteristic of the dual organization, but although it is of most frequent occurrence there are several exceptions. Among certain N. American tribes, e.g., the Hidatsa, Yuchi, Western Mono and Iroquois, marriage between members of the same moiety is not prohibited. When the moieties are exogamous a man is never permitted to marry any woman he chooses in the opposite moiety. The form of marriage is always dependent upon other factors, such as age, status and kinship, where certain relatives are prescribed as eligible mates while marriage between others is not permitted. Thus the form of marriage most frequently found with the dual organization is that between cross-cousins, and, where the moieties are exogamous, it follows (whether descent be patrilineal or matrilineal) that cross-cousins belong to different moieties, while parallel cousins between whom marriage is not permitted, become mem-

FIG 1

bers of the moiety system. The dual organization in such cases does not determine but merely systematizes the form of marriage. Only under exceptional circumstances can cross cousin marriage result from the division of the community into moieties (see COUSIN MARITAL).

Other functions of the dual organization vary according to the community in which it is found. In the daily life of the people, the members of the two moieties are very commonly separated at games, feasts, contests, etc., and may even inhabit different parts of the settlement. Often there is also a striking development of reciprocal services between the two moieties, so that they assist each other, e.g., at the initiation and burial of their members, at the building of houses and in various other economic enterprises, while communal ceremonies are usually so arranged that one moiety is conceived as giving them to the other. The symmetry of structure characteristic of the dual organization here serves as the indispensable basis of reciprocal obligations (cf. B. Malinowski, *Crime and Custom in Savage Society*, chap. IV). Thus among the Iroquois of N. America the two moieties are always represented at the great annual festivals and at the ceremonial meetings of the medicine or religious societies, and in the ceremonial Long House they are spatially separated, the speakers on each side addressing the other in the course of the ceremony, games such as ball and lacrosse, are also played between the two moieties, they have the obligation of burying each other's members, and they also exercise political functions, each moiety e.g., having the right of veto over the choice of the other in the election of chiefs (cf. L. H. Morgan, *The League of the Iroquois*).

Again, there is sometimes to be found a theoretical dichotomy of the universe whereby all natural phenomena are divided between the two moieties, and especially where the moieties are subdivided into clans, this system of classification is frequently accompanied by totemism (q.v.). Thus the Wotjobaluk of S.E. Australia have two moieties called Krokitich and Gamutch, each of which is subdivided into a number of clans. Associated with each moiety in rather arbitrary fashion is a long list of animals, plants, etc., in fact, the native concept is that everything in the world is either Krokitich or Gamutch. This classification is carried still further, so that objects regarded as belonging say to Krokitich are subdivided among the clans composing that moiety. Moreover suppose a man is a member of a certain clan in the Krokitich moiety to which the white cockatoo also belongs then the white cockatoo is his totem, and he has a series of special observances to fulfil towards it while he also has a general ritual relation towards all the other objects belonging to his moiety (cf. A. W. Howitt, *Native Tribes of S.E. Australia*).

Frequently also the dual division of the community seems to stimulate a tendency to emphasize contrasts between the two moieties. One moiety, e.g., is believed to be of local origin, the other to have come from elsewhere, or they are supposed to have different physical and mental characters, or their mythologies and traditions differ, or the one is regarded as superior to the other, or their names are antithetical, e.g. the widespread Australian names "Eaglehawk" (white) and "Crow" (black).

Sometimes, as in Melanesia, the moieties are apparently even hostile, and each regards the other with dislike and suspicion. All such distinctions bring out the fundamental significance of the dual organization in the structure of the community.

Theories of Origin—The dual organization is ascribed sometimes to a process of fission whereby a single group came to be divided into two moieties. On the other hand Rivers (*The History of Melanesian Society*, chap. XXXVII), emphasizing the idiosyncrasy contrast between the two moieties as found in Melanesia, believed that the dual organization there developed as the result of the intermixture of two distinct peoples, one of which migrated into the region and set up a social system in co-operation with the communities it found there. This idea is carried still further, by not restricting the term "dual organization" to the moiety system, to which alone it applies but extending it to dualism of every form—economic, political, religious, mythological etc.—regarded as having originated in Egypt as the result of a process whereby a duality of ruling groups became completely superseded on a duality of a

territorial nature (Upper and Lower Egypt), and as having spread with these characteristics to all parts of the world where it is now found (cf. W. J. Perry, *The Children of the Sun*). This theory however suffers from defects which render it unacceptable.

All theories which attempt to find a single origin for the dual organization are inadequate. This mode of social structure cannot be regarded either as the invention of one people or as the result of one particular social process. It is a recurring institution that has arisen many times in different places—now by the reduction of clans, now by the fusion of two intermarrying groups, and again by other processes. No one theory of origin can be laid down as conclusive—each occurrence must receive special investigation. (I S)

BIBLIOGRAPHY—The following general works on primitive society should be consulted: Sir J. G. Frazer, *Totemism and Exogamy* (1910), useful as a collection of data; R. H. Lowie, *Primitive Society* (1919, 2nd ed. 1936); A. A. Goldenweiser, *Early Civilization* (1922); W. H. R. Rivers, *Social Organization* (1924).

DUARS, a tract of country in north east India consisting of the Western and the Eastern Duars, both of which belonged to Bhutan prior to the Bhutan War of 1864-65, as a result of this they passed into possession of the British, when the Eastern Duars were assigned to Assam and the Western to Bengal. The Eastern Duars, 1,570 sq. m., are in the Gopalganj district of Assam forming a strip of flat country lying beneath the Bhutan mountains. It is but slightly developed and sparsely populated. The Western Duars, 1,862 sq. m., lie at the foot of the Himalayas in the north east of the Jalpaiguri district of Bengal. They are traversed by the Bengal Duars railway and are an important centre of the tea-planting industry.

DU BARRY, MARIE JEANNE BECU, COMTESSE (1746-1793), French adventuress, mistress of Louis XV. was born at Vauxoulours on Aug. 19, 1746, the illegitimate daughter of a tax collector. She lived as a courtesan in Paris under the name of Madlle Lunge, and Jean, comte du Barry, took her into his house to make it more attractive to the dupes whose money he won by gambling. Through Lubel, valet de chambre of Louis XV., and the duc de Richelieu, he succeeded in installing her, in 1769, as official mistress of the king, after a nominal marriage with Guillaume du Barry. The duc de Choiseul, who refused to acknowledge her, was disgraced in 1771, and the duc d'Angoulême, who had the reputation of being her lover, took his place, and in concert with her governed the monarch. Louis XV. built for her the mansion of Luciennes. At his death in 1774 an order of his successor banished her for a brief period to the abbey of Pont aux Dames, near Meaux. She led a retired life at Luciennes with the comte de Cossé-Brissac. Having gone to England in 1792 to endeavour to raise money on her jewels, she was on her return arrested before the Revolutionary Tribunal of having conspired against the republic. She was condemned to death on Dec. 7, 1793, and guillotined the same evening. Her contemporaries, scorning her low birth rather than her vices, attributed to her a malicious political role of which she was at heart incapable, and have done scant justice to her quick wit, her frank but gracious manners and her seductive beauty. The volume of *Lettres et anecdotes* (1779) which bears her name was not written by her.

See E. and J. de Goncourt, *La du Barry* (Paris, 1880); C. Vatel, *Histoire de Madame du Barry* (1882-83), based on sources; R. Douglas, *The Life and Times of Madame du Barry* (1896); Saint-André, *Madame du Barry* (1908).

DU BARTAS, GUILLAUME DE SALLUSTE, SEIGNEUR (1544-1590), French poet, was born near Auch. He was employed by Henry IV of France in England, Denmark and Scotland, and he commanded a troop of horse in Gascony, under the marshal de Matignon. He was a convinced Huguenot, and cherished the idea of writing a great religious epic in which biblical characters and Christian sentiment were to supplant the pagan *mise en scène* then in fashion. His first epic, *Judith*, appeared in a volume entitled *La Muse chrétienne* (Bordeaux, 1573). This was followed five years later by his principal work, *La Sepmaine*, a poem on the creation of the world. This work was held by admirers of du Bartas to put him on a level with Ronsard, and

30 editions of it were printed within six years after its appearance. Its religious tone and fanciful style made it a great favourite in England where the author was called the divine du Bartas, and placed on an equality with Aristotle. Spenser, Hall and Ben Jonson all speak of it in the highest terms. King James VI of Scotland tried his poetical hand at the translation of du Bartas's poem *L'Uranie*, and the compliment was returned by the French writer who translated, as *La Iéphanthe*, James's poem on the battle of Lepanto. Du Bartas began the publication of the *Secondes Sepmaines* in 1584. He aimed at a great epic, never completed, which should stretch from the story of the creation to the coming of the Messiah. Du Bartas died in July 1590 in Paris from wounds received at the battle of Ivry.

Joshua Sylvester translated the *Sepmaines* in 1598, other English translations from du Bartas are *The Historie of Iudith* (1584), by Thomas Hudson, of portions of the "Weeks" (1623) by William Lisle (1569-1637), the Anglo-Saxon scholar, *Uranie* (1589), by Robert Ashley (1565-1641), and Sir Philip Sidney (see Florio's dedication of the second book of his translation of Montaigne to Lady Rich) wrote a translation of the first "Week," which is lost. *The Œuvres complètes* of du Bartas were printed at Paris (1579), Paris and Bordeaux (1611), a selection, *Chœur de poésies*, was edited by Benric and de Gourcuff in 1890. See also G. Pellissier, *La Vie et les œuvres de du Bartas* (1883), H. Ashton, *Du Bartas en Angleterre* (1908).

DUBAWNT or **DOOBAUNT** (Indian *Toobaung*, i.e., turbid), a river of Mackenzie and Keewatin districts, Canada. It rises in Wholodia (or Daly) Lake, in 104° 25' W and 66° 15' N, and flows northward to its confluence with the Thelon river, and thence eastward to Chesterfield Inlet, an arm of Hudson Bay.

DUBBO, a town about 180 mi N.W. of Sydney, New South Wales, Australia, on the Macquarie river, a manufacturing town in a wheat and sheep district with coal and copper in the neighbourhood. It has perhaps the most uniform rainfall in Australia, being on the line separating summer and winter rainfall types. Pop. (1933) 8,344.

DU BELLAY, GUILLAUME, SIEUR DE LANGEY (1491-1543), French soldier and diplomat, was born at the château of Catigny, near Montmarais in 1491, of the Angevin family which gave many soldiers to France. Guillaume, the eldest of six brothers, was a soldier, humanist, historian, and the most able diplomat at the command of Francis I. He was taken prisoner at Pavie (1525) and shared the captivity of Francis I. He was sent three times to England in 1529-1530, was occupied with the execution of the treaty of Cambrai and also with the question of Henry VIII's divorce. With the help of his brother Jean, then bishop of Paris, he obtained a decision favourable to Henry VIII from the Sorbonne (July 2, 1530). From 1532 to 1536, though he went three times to England, he was principally employed in uniting the German princes against Charles V., in May 1537 he signed the treaty of Schyren with the dukes of Bavaria, the landgrave of Hesse, and the elector of Saxony, and in Jan. 1544 the treaty of Augsburg. During the war of 1537 Francis I. sent him on missions to Piedmont, he was governor of Turin from Dec. 1537 till the end of 1539, and subsequently replacing Marshal d'Annebaut as governor of the whole of Piedmont, he displayed great capacity in organization. But at the end of 1542, overwhelmed by work, he was compelled to return to France, and died near Lyons on Jan. 9, 1543. Rabelais, an eye witness, has left a moving story of his death (*Pantagruel*, bk. 21, and iv. ch. 27). Charles V. is said to have remarked that Langey, by his own unaided efforts did more mischief and thwarted more schemes than all the French together.

Without actually joining the reformers Guillaume du Bellay defended the innovators against their fanatical opponents. In 1534-35 he even tried, unsuccessfully, to bring about a meeting between Francis I. and Melancthon, and in 1541 he intervened in favour of the Vaudois. Rabelais was the most famous of his clients, and followed him to Piedmont from 1540 to 1542. Guillaume was himself a clear and precise writer. He imitated Livy in his *Oedoes*, a history of the rivalry between Francis I. and the emperor from 1521, of which fragments were inserted by his brother Martin du Bellay (d. 1559) in his *Mémoires* (1569). The celebrated *Instructions*, reprinted as *Traité de la discipline militaire* in 1554 and 1592 and translated into Italian, Spanish and

German, are not his (see Bayle *Dict. Hist.*, i. 502, and Jahns, *Geschichte der Kriegswissenschaften* i. 498 seq.).

See also the edition of Martin du Bellay's *Mémoires* by Michaud and Poujoult (1836), and Bourrill's *Fragment de la première Oedoes* (Paris, 1905). There is an excellent study of Guillaume du Bellay by V. L. Bourrill (Paris, 1905).

DU BELLAY, JEAN (c. 1490-1560), French cardinal and diplomat, younger brother of Guillaume du Bellay, appears as bishop of Bayonne in 1526, member of the privy council in 1530, and bishop of Paris in 1531. He carried out several missions in England (1537-34) and Rome (1534-36). In 1535 he received his cardinal's hat, in 1536-37 he was nominated "lieutenant general" to the king at Paris and in the Ile de France, and was entrusted with the organization of the defence against the imperialists. When Guillaume du Bellay went to Piedmont, Jean was put in charge of the negotiations with the German Protestants, principally through the humanist Johann Sturm and the historian Johann Sleidan. In the last years of the reign of Francis I., Cardinal du Bellay was in favour with the duchesse d'Étampes and received many benefices. Under Henry II, being involved in the disgrace of all the servants of Francis I. he was sent to Rome (1547), and he obtained eight votes in the conclave which followed the death of Pope Paul III. After three quiet years passed in retirement in France (1550-53), he was charged with a new mission to Pope Julius III and took with him to Rome his young cousin the poet Joachim du Bellay (q.v.). In 1555 he was nominated bishop of Ostia and dean of the Sacred College. He died at Rome on Feb. 10, 1560. The cardinal had brilliant qualities, was on the side of toleration and protected the reformers. Budaev was his friend, Rabelais his faithful secretary and doctor, men of letters, like Étienne Dolet, and the poet Simon Maugin, were indebted to him for assistance. He left three books of graceful Latin poems (printed with Salmon Macrin's *Odes*, 1546, by R. Estienne), and some other compositions, including *Franciscus Francorum regis epistola apologetica* (1542).

BIBLIOGRAPHY—The Bibliothèque Nationale at Paris has numerous unpublished letters of Jean du Bellay. See also Ribier, *Lettres et mémoires d'éclat* (Paris, 1666), V. L. Bourrill and P. de Vassiere, *Ambassade de Jean du Bellay en Angleterre* vol. 1 (Paris, 1905), marquis de la Jonquière, *Le Cardinal du Bellay* (Alençon, 1887), Heulhard, *Rabelais, ses voyages en Italie* (Paris, 1891), Chamard, *Joachim du Bellay* (Ile, 1900), V. L. Bourrill, *Guillaume du Bellay* (Paris, 1905), "Jean du Bellay, les protestants et la Sorbonne" in the *Bulletin du Protestantisme français* (1903, 1904), and "Jean Sleidan et le Cardinal du Bellay," in the *Bulletin*, etc. (1901, 1906).

DU BELLAY, JOACHIM (c. 1521-1560), French poet and critic, member of the Pleiade, was born at the château of La Turmelière, not far from Lire near Angers, being the son of Jean du Bellay, seigneur de Gonnor, cousin german of the cardinal Jean du Bellay and of Guillaume du Bellay. Both his parents died while he was still a child, and he was left to the guardianship of his elder brother, René du Bellay, who neglected his education, leaving him to run wild at La Turmelière. When he was 23, however, he went to Poitiers to study law, no doubt with a view to obtaining preferment through his kinsman the cardinal. At Poitiers he came in contact with the humanist Marc Antoine Muret and with Jean Salmon Macrin (1490-1557), a Latin poet famous in his day. There too he probably met Jacques Peletier, who had published a translation of the *Ars poetica* of Horace, with a preface in which much of the programme advocated later by the Pleiade is to be found in outline.

It was probably in 1548 that du Bellay met Ronsard in an inn on the way to Poitiers, an event which may justly be regarded as the starting-point of the French school of Renaissance poetry. The two immediately became fast friends. Du Bellay returned with Ronsard to Paris to join the circle of students of the humanists attached to Jean Daurat (q.v.) at the Collège de Coqueret. While Ronsard and Antoine de Brif were most influenced by Greek models, du Bellay was more especially a Latinist, and perhaps his preference for a language so nearly connected with his own had some part in determining the more national and familiar note of his poetry. In 1548 appeared the *Art poétique* of Thomas Sibilet, who championed the cause of Clément Marot and his disciples, and poured scorn on the sonnet and on new fangled ideas

subsidence in the ground affords a nucleus for the formation of bog with which about 2,000 ac are covered. There are also a few small tracts of bog in the northern part of the county. The mountain district is well adapted for timber. The northern coast of the county from Balbriggan to Howth has generally a sandy shore, and affords only the small harbours of Balbriggan and Skerries. In the promontory of Howth, the coast suddenly assumes a bolder aspect, and between the town of Howth and the rocky islet of Ireland's Eye an unsuccessful artificial harbour was constructed. Kingstown harbour on the south side of Dublin bay superseded this, and is by far the best in the county. The chief river is the Liffey, which rises in the Wicklow mountains about 12 m S.W. of Dublin, and empties itself into Dublin bay. The course of the river is so tortuous that 40 m may be traversed and only ten gained in direction.

Dublin is among the counties generally considered to have been formed by King John, and comprised the chief portion of country within the English pale. The limits of the county, however, were uncertain and underwent many changes before they were fixed. As late as the 17th century the mountainous country south of Dublin offered a retreat to the lawless, and it was not until 1606 that the boundaries of the county received definition in this direction, along with the formation of county Wicklow. Although so near the seat of government much land was forfeited in the Rebellion of 1641 and in the Revolution of 1688. In 1867 the most formidable of the Fenian risings took place near the village of Tallaght, about 7 m from the city. Raids or encampments are frequent, and there are also dolmens and round towers.

The extension of Dublin city and its suburbs has no doubt had its influence on the decrease of acreage under both tillage and pasture. Oats and potatoes are the principal crops, but live stock, especially cattle, receives greater attention. A large proportion of the land holdings are smaller than one acre. The manufactures of the county are mainly confined to the city and suburbs, but there is manufacture of cotton hosiery at Balbriggan. Fisheries, both deep sea and coastal, are important, and Kingstown is the headquarters of the fishery district. The salmon fishery district of Dublin also affords considerable employment. The communications of the county are good, several important railways and two canals converging upon the city of Dublin, under the head of which they are considered. Co. Dublin returns five members to Dail Eireann.

DUBLIN, county borough and seaport, and the metropolis of Eire. It lies at the head of a bay of the Irish Sea, to which it gives name, about midway on the eastern coast of the island and 70 mi W. of Holyhead. The Gaelic name, Baile Atha Chlath, "Town of the Ford of the Hurdles," is now used by the Post Office. Pop. (1936) 468,703.

History—The name of Dublin signifies the "Black pool." It is recorded that the inhabitants of Leinster were defeated by the people of Dublin in the year 291. Christianity was introduced by St. Patrick about 450. In the 9th century the Danes took Dublin. The first Norse king was Thorkel I. (832), though the Danes had appeared in the country as early as the close of the previous century. Thorkel established himself strongly at Armagh. In 1014 Brian Borohme, king of Munster, fought the battle of Clontarf against the Danes, and he and his son and 11,000 of his followers fell. The Irish, however, won the battle, but the Danes reoccupied the city. Constant struggles with the Irish resulted in intermissions of the Danish supremacy from 1052 to 1072, at various intervals between 1075 and 1118 and from 1124 to 1136. The Danes were finally ousted by the Anglo-Normans in 1171. In 1172 Henry II. came to Dublin and held his court there. Previous to his departure for England, Henry bestowed the government on Hugh de Lacy, having granted by charter "to his subjects of Bristol his city of Dublin to inhabit, and to hold of him and his heirs for ever, with all the liberties and free customs which his subjects of Bristol then enjoyed at Bristol and through all England." In 1176 Strongbow, earl of Pembroke, died in Dublin and was buried in Christ Church cathedral. A fresh charter was granted in 1207 by King John to the inhabitants of Dublin, who were at constant feud with the native Irish. In 1216 Magna

Carta was granted to the Irish by Henry III. In 1217 the fee farm of the city was granted to the citizens at a rent of 200 marks per annum, and about this period many monastic buildings were founded. In 1227 the same monarch confirmed the charter of John fixing the city boundaries and the jurisdiction of its magistrates.

During the invasion of Ireland by Edward Bruce in 1315 some of the suburbs of Dublin were burnt to prevent their falling into

GRAPH OF THE AVERAGE TEMPERATURE IN DUBLIN THROUGH THE YEAR. The mercury in the thermometer stands at the normal annual mean temperature. The curve shows the normal monthly mean temperature through the year. The columns below indicate the normal precipitation for each month.

his hands. The mood of Bruce had been countenanced by native Irish ecclesiastics, whose sentiments were recorded in a state ment to Pope John XXII.

Richard II. erected Dublin into a marquessate in favour of Robert de Vere, whom he also created duke of Ireland. The same monarch entered Dublin in 1394, and after holding a parliament and making much courtly display before the native chieftains, returned to England. Five years later Richard returned to Ireland and visited Dublin, where he remained a fortnight.

In 1534 Lord Thomas Fitzgerald, son of the Lord Deputy Kildare, organized a rebellion against the English Government and attacked the city of Dublin itself, but raised the siege on certain conditions. After many vicissitudes, Lord Thomas and others were executed at Tyburn in 1536.

At the outbreak of civil war in 1641, a conspiracy to seize Dublin Castle was disclosed, and the city was thus preserved for the king's party, but the Irish outside began an indiscriminate extermination of the Protestant population. In 1646 Dublin was besieged unsuccessfully by the Irish. The city had been put in an efficient state of defence by the marquess of Ormonde, then lord-lieutenant, but in the following year, to prevent its falling into the hands of the Irish, he surrendered it on conditions to Colonel Jones, commander of the Parliamentary forces. In 1649 Ormonde was totally defeated at the battle of Bagginot, near Old Rathmines, in an attempt to recover possession. The same year Cromwell landed in Dublin, as commander-in-chief under the parliament.

When James II. landed in Ireland in 1689 to assert his right to the British throne, he held a parliament in Dublin, which passed acts of attainer against upwards of 3,000 Protestants. The governor of the city, Colonel Luttrell, at the same time issued a proclamation ordering all Protestants not householders, excepting those following some trade, to depart from the city within 24 hours, under pain of death or imprisonment, and in various ways restricting those who were allowed to remain. In the hope of relieving his financial difficulties, the king depreciated the coinage. After his defeat at the battle of the Boyne, James returned to Dublin for a few hours. William III. on the following day proceeded in state to St. Patrick's cathedral to return thanks for his victory.

In 1783 a convention of delegates from all the volunteer corps in Ireland assembled in Dublin for the purpose of procuring a

reform in parliament, but the House of Commons refused to entertain the proposition. In May 1798 a conspiracy planned by the United Irishmen to seize the city was frustrated. In 1803 an insurrection broke out, but was immediately quelled, with the loss of some lives in the tumult, and the death of its leaders on the scaffold. In 1848 the lower classes in Dublin were greatly agitated, but the city was saved from much bloodshed. In 1867 the most serious of modern conspiracies, that known as the Fenian organization, came to light. The Habeas Corpus Act was suspended at one sitting by both Houses of Parliament and about 960 arrests were made in Dublin in a few hours. Dublin Castle was fortified, and the citizens lived in a state of terror for several weeks together. For later history, see IRELAND.

GROWTH OF THE CITY

Buildings.—The expansion of Dublin from a castle nucleus is of great interest to the student of town planning. The castle was built on a ridge overlooking the river and the low ground to the east. Within the limits of the old walls are found Christ Church cathedral, the city hall, municipal offices, and several business premises. Speed's map of 1610 gives a good idea of this settlement and shows also some buildings, to the north of the river. With the exception of some of the churches, however, the buildings now found in the old centre of the city are themselves, later than the 17th century. The castle was originally built in the first two decades of the 13th century, and there are portions of this period, but nearly the whole is of the 16th century and later.

The cathedral of Christ Church, or Holy Trinity, was founded by Sigtryg, a Christianized king of the Danes of Dublin, in 1018 but dates its elevation to a deanery and chapter from 1541. It was restored in 1870-77 by G. E. Street, who rebuilt the choir and south side of the nave, but the model of the ancient building was followed with great care. The crypt embodies remains of the founder's work, the rest is Transitional Norman and Early English in style. Among the monuments is that of Strongbow, the invader of Ireland, to whom the earlier part of the superstructure (1170) is due. Here the tenants of the church lands were accustomed to pay their rents. Synods were occasionally held in this church, and parliaments also, before the Commons' Hall was destroyed in 1566. Here also the pretender Lambert Simnel was crowned.

The portions of the city immediately around the castle nucleus represent the development up to the first half of the 19th century. There was considerable growth to the north of the river where Sackville (O'Connell) street is one of the principal thoroughfares, although it was badly damaged in 1922. In it is the Nelson pillar, 134 ft. in height with a statue of the admiral on the top. Farther to the east are the docks. The customs house was destroyed in 1922 but was rebuilt. The most interesting buildings, however, are to the south of the river.

A short distance south from Christ Church, through the squalid quarter of Nicholas and Patrick streets, stands the cathedral dedicated to St. Patrick, the foundation of which was an attempt to supersede the older foundation of Christ Church, owing to jealousies, both ecclesiastical and political, arising out of the Anglo-Norman invasion. It was founded about 1160 by John Comyn, archbishop of Dublin, but there was a church dedicated to the same saint before. It was burnt about 200 years later but was rebuilt. At the Reformation it was deprived of its status as a cathedral, and the building was used for some of the purposes of the courts of justice. Edward VI contemplated its change into a university, but the project was defeated. In the succeeding reign of Mary, St. Patrick's was restored to its original purpose. The installations of the knights of St. Patrick were originally held here. This cathedral contains the monument of Dean Swift. Attached to the cathedral is Marsh's library, incorporated in 1707, by a request of Primate Marsh, archbishop of Armagh.

Westmoreland street is a continuation to the south of Sackville street and where it meets Dame street, which leads up to the castle, are situated the Bank of Ireland and Trinity college. The Bank of Ireland was formerly the House of Parliament. There are three fronts, the principal, towards College Green, is a

colonnade of the Ionic order, with façade and two projecting wings, it connects with the western portico by a colonnade of the same order, forming the quadrant of a circle. The eastern front which was the entrance of the House of Lords, is of the Corinthian order. The House of Lords contains tapestry dating from 1733 and remains in its original condition, but the octagonal House of Commons was demolished by the bank directors. The building was begun in 1729 but the fronts date from the end of the century, the remodelling took place in 1803.

Trinity College.—Trinity college, or the University of Dublin founded in 1591, has a Palladian façade (1759), with two statues by Foley, of Goldsmith and Burke. Above the gateway is a hall called the Regent House. The first quadrangle, Parliament square contains the chapel (1798), with a Corinthian portico, the public theatre or examination hall (1787), containing portraits of Queen Elizabeth, Molyneux, Burke, Bishop Berkeley and other celebrities, and the wainscoted dining hall, also containing portraits. A beautiful cimpanle (1853) occupies the centre of the square. The library is one of those scheduled in the Copyright Act entitled to receive a copy of every volume published in the United Kingdom. There is a notable collection of early Irish manuscripts including the ornamented Book of Kells, containing the gospels. The building was begun in 1712. In this square are the oldest buildings of the foundation dating in part from the close of the 17th century, and the modern Graduates' Memorial building (1904). These contain a theatre, library and reading room, the rooms of the college societies and others. The schools form a fine modern pile (1856), and other buildings are the provost's house (1760), printing house (1760), museum (1857) and the medical school buildings in three blocks, one of the best schools in the kingdom. Other buildings of the 20th century include chemical laboratories. The college (recreation) park and fellows' garden are of considerable beauty. The college observatory is at Dunsink about 5 m. N.W. of Dublin. It was erected in 1785, and in 1799 was placed by statute under the management of the royal astronomer of Ireland, whose official residence is here. The magnet observatory of Dublin was erected in the years 1837-38 in the gardens attached to Trinity college, at the expense of the university. A normal climatological station was established in the fellows' garden in 1904. The botanic garden is at Ball's Bridge 1 m. S.E. of the college.

The outer portions of the city extending as far as the circular road which skirts the periphery date from the second half of the 19th century whilst beyond this boundary has been some more recent development. The congestion in the tenements of the older quarter has to some extent been relieved although much remains to be done. Near St. Stephen's Green is University college, which occupies the site of the International Exhibition of 1865. University college is one of the constituent colleges, with Cork and Galway, of the National University of Ireland.

COMMERCE AND TRANSPORTATION

Trade.—Dublin was for long stigmatized as lacking, for so large a city, in the proper signs of commercial enterprise. About the time of the Revolution, the woollen trade flourished in Dublin and the produce attained great celebrity. The cheapness of labour attracted capitalists, who started extensive factories in that quarter of the town known even now as the Liberties. This quarter was inhabited altogether by workers in wool. About 1700 the English legislature prevailed on William III to assent to laws which directly crushed the Irish trade. All exportation except to England was forbidden, and the woollen manufacture soon decayed. But at the close of the 18th century there were 5,000 persons at work in the looms of the Liberties. About 1715 parliament favoured the manufacture of linen, and the Linen Hall was built. The cotton trade was soon afterwards introduced, and silk manufacture was begun by the Huguenots, who had settled in Dublin in considerable numbers after the revocation of the edict of Nantes. Acts favourable to these enterprises were passed, and they flourished apace. But the old jealousy arose in the reign of George I and in the reign of George III an Act was passed which tended directly to the ruin of the manufacture. The line shared the same fate. Dublin poplins, however, keep their reputa-

tion. However adverse influences may have been combated, Dublin yet produces little for export save whisky and porter, but a considerable export trade, principally in agricultural produce, passes through Dublin from the country. To the manufacturing industries of the city there should be added mineral water works, biscuit-making, glass making, cigarette-making, foundries and ship building.

By continual dredging a great depth of water is kept available in the harbour. The Dublin Port and Docks Board, which was created in 1898, undertook considerable works of improvement at the beginning of the 20th century. These improvements, *inter alia*, enabled vessels drawing up to 23 ft. to lie alongside the extensive quays which border the Liffey at low tide. The extensive Alexandra tidal basin, on the north side of the Liffey, admits vessels of similar capacity. The Custom House Works on the north side have about 17 ft. of water. With docks named after them are connected the Royal and Grand canals, passing respectively to north and south of the city, the one penetrating the great central plain of Ireland on the north, the other following the course of the Liffey, doing the same on the south and both joining the river Shannon. The docks attached to the canals, and certain other smaller docks, are owned by companies. Vessels entering these piers toll, but not those entering docks under the Board.

The direct route to Dublin from London and other parts of England is by the Holyhead route, controlled by the LMSR with steamers to the port of Dublin itself, while the company also works in conjunction with the mail steamers of the City of Dublin Steam Packet Company to the outlying port of Kingstown, 7 mi S.E. Passenger steamers, however, also serve Liverpool, Heysham, Bristol, the south coast ports of England and London, Edinburgh and Glasgow, and other ports of Great Britain. The rail ways leaving Dublin are the following: the Great Northern, with suburban lines and a main line running north to Drogheda, Dundalk and Belfast, with ramifications through the northern counties, the Great Southern to Kilkenny, Athlone and Cork, the Midland Great Western to Cavan, Sligo and Galway, and there is the North Wall station of the LMSR, with the line known as the North Wall extension, connecting with the other main lines. The internal communications of the city are excellent, electric tram ways which connect all the principal suburbs. The county borough of Dublin is divided into four constituencies—Dublin North East returning three members, Dublin North West returning five, Dublin South returning seven and Dublin Townships three to David Eustace. Dublin is governed by an elected council and a manager. The council's powers are restricted to imposing rates, raising loans and making by-laws. Other functions are performed by the manager, a paid official who has power over all municipal officers and whose own removal is subject to central authority.

See W. Harris, *History and Antiquities of the City of Dublin* (1766), Sir J. T. Gilbert, *History of the City of Dublin* (1859), L. J. Voigt, *Dublin vom Norik* (Christians, 1896), *The Dublin Civic Survey*, vol. II of the publications of the Civic Institute of Ireland (1925).

DUBLIN, a city of Georgia, U.S.A., on the Oconee river, 125 mi S.E. of Atlanta, the county seat of Laurens county. It is on federal highway 80, and is served by the Macon, Dublin and Savannah and the Wrightsville and Tennesse railroads. The population was 10,213 in 1950 and 7,814 in 1940 by federal census. It is a shipping point for various agricultural products, lumber and naval stores, produces peanuts, and has cottonseed oil mills, fertilizer plants and wood-working industries. A veterans' hospital is located there. The city was incorporated in 1812.

DUBNER, JOHANN FRIEDRICH (1802-1867), German classical scholar (naturalized a Frenchman) was born in Heselager, near Gotha. In 1813 he was invited by the brothers Didot to Paris, to co-operate in a new edition of H. Etienne's *Greek Testament*, and did many volumes in Didot's *Bibliotheca Graeca*. He received the Legion of Honour for his edition of Caesar, undertaken by command of Napoleon III. His editions did much to raise the standard of classical scholarship in France. He violently attacked Burnouf's method of teaching Greek, but without result. Dubner may have gone too far in his zeal for reform, but time has shown him to be right. The old text books

have been discarded, and a great improvement in classical teaching has taken place.

See F. Godefroy, *Notice sur J. J. Dubner* (1867), Sainte Beuve, *Discours a la memoire de Dubner* (1868), article in *Allgemeine deutsche Biographie*.

DUBOC, JULIUS (1829-1903), German author and philosopher, was born on Oct. 10, 1829, at Hamburg, and died on June 11, 1903, at Dresden. He studied at both Leipzig and Berlin and became a disciple of Feuerbach. Evolutionary monism, atheism, and the doctrine that pleasure is the end of all human activity find expression in his works, which include *Soziale Briefe* (3rd ed. 1875), *Die Psychologie der Liebe* (1874), *Das Leben ohne Gott* (1875), *Hundert Jahre Zeitgeist in Deutschland* (1889), and *Die Lust als sozialtheistisches Entwicklungsprinzip* (1900).

DUBOIS, FRANÇOIS CLEMENT THEODORE (1837-1914), French musical composer, was born at Romoray (Marne) on Aug. 24, 1837. He studied at the Conservatoire under Ambrose Thomas, and won the Grand Prix de Rome in 1861 with his cantata *Atala*. On his return to Paris he was appointed 'maître de Chapelle' at the church of Ste. Clotilde where Cesar Franck was organist. Here he produced *Les Sept Paroles du Christ* (1867), a work which has become well known in France. In 1868 he became 'maître de Chapelle' at the Madeleine, and nine years later succeeded Camille Saint-Saëns there as organist. He became professor of harmony at the Conservatoire in 1871, and was appointed professor of composition in succession to Leo Delibes in 1891. At the death of Ambrose Thomas in 1896 he became director of the Conservatoire, he retired in 1905. Dubois was an extremely prolific composer and wrote in a variety of forms. His sacred works include four masses, a requiem, a large number of motets and pieces for organ. For the theatre he composed a light opera, *La Cécile de l'Émir* (Athènes, April 30, 1873), a one act piece, *La Pan bi* (Opera Comique, Feb. 20, 1879), a ballet, *La Farandole* (Grand Opera, Dec. 14, 1883), *Don Hamet*, a four act opera (Théâtre Italien, Dec. 10, 1884), *Xavère*, a dramatic idyll in three acts (Opera Comique, Nov. 26, 1895). His orchestral works include two concert overtures, the overture to *Frisco* (1880), several suites, *Marche héroïque de Jeanne d'Arc* (1888), etc. He was also the author of various sacred works and in addition he composed much for the piano and voice. Dubois died in Paris on June 11, 1914.

DUBOIS, GUILLAUME (1656-1723), French cardinal and statesman, was born at Brive, Corrèze, on Sept. 6, 1656. He received the tonsure at the age of 13, was educated at the college of St. Michel at Paris, and became tutor to the young duke of Chartres, afterwards duke of Orleans. When his pupil became regent (1715) Dubois, who had for some years acted as his secretary, was made councillor of state and the chief power passed into his hands.

His policy was steadily directed towards maintaining the peace of Utrecht. To counteract Alberoni's intrigues for the aggrandizement of Spain, he suggested an alliance with England, and succeeded in negotiating the Triple Alliance (1717). In 1719 he sent an army into Spain, and forced Philip V. to dismiss Alberoni. Other wise his policy remained that of peace. Dubois's success strengthened him against the bitter opposition of a large section of the court. In spite of his dissolute life he asked the regent to give him the archbishopric of Cambrai. His demand was supported by George I. and the regent yielded. In one day all the usual orders were conferred on him, and even Massillon consented to take part in the ceremonies. After long and most profitable negotiations on the part of Pope Clement XI. the red hat was given to him by Innocent XIII. (1721), whose election was largely due to the bribes of Dubois. This cardinalate cost France about 8,000,000 francs. In the following year he was named first minister of France (August).

When Louis XV. attained his majority in 1723, Dubois remained chief minister. He had accumulated an immense private fortune, possessing in addition to his see the revenues of seven abbeys. He died at Versailles on Aug. 10, 1723. His portrait was thus

drawn by the duc de St Simon—"He was a little, pitiful, wizened, herring gutted man, in a flaxen wig, with a weasel's face, brightened by some intellect. All the vices—peridity, avarice, debauchery, ambition, flattery—fought within him for the mastery. He was so consummate a liar that, when taken in the fact, he could brazenly deny it." This famous picture is certainly biased Dubois, in spite of his vices, gave France peace after the disastrous wars of Louis XIV.

In 1789 appeared *Vie privée du Cardinal Dubois*, attributed to one of his secretaries, Mongez, and in 1815 his *Mémoires secrets et correspondance inédite*, edited by L. de Sevelinges. See also A. Cheruel, *Saint-Simon et l'abbé Dubois*, L. Wiesener, *Le Régent, l'abbé Dubois et les Anglais* (1891), and memoirs of the time.

DUBOIS, JEAN ANTOINE (1765-1848), French Catholic missionary in India, was ordained in the diocese of Viviers in 1792, and sailed for India in the same year under the *Missions Étrangères*. He at first worked in the southern districts of the present Madras presidency. On the fall of Seringapatam in 1799 he went to Mysore to reorganize the Christian community shattered by Tipu Sultan. He benefited his impoverished flock by founding agricultural colonies and introducing vaccination as a preventive of smallpox. By his fervent desire to understand Hindu life, he gained an extraordinary welcome amongst all castes, and is still spoken of in many parts of south India with affection and esteem as "the prince's son, the noblest of Europeans." His great work, *Hindu Manners, Customs and Ceremonies* (3rd ed., Oxford, 1900) gives a shrewd, clear sighted, candid account of the manners and customs of the Hindus. Dubois left India in Jan. 1823, and on reaching Paris was appointed director of the *Missions Étrangères*, of which he afterward became superior (1836-39). He translated into French the famous book of Hindu fables called *Panchatantra*, and also a work called *The Exploits of the Gurm Paramart*. He died on Feb. 17, 1848.

DUBOIS, LOUIS ERNEST (1850-1929), French ecclesiastic, was born at Saint Calais, France, Sept. 1, 1856. In 1901 he became bishop of Verdun, in 1909 Archbishop of Bourges, and in 1916 of Rouen. He was made cardinal of Santa Maria in Aquino, Rome, by Pope Benedict XV. In Dec. 1916. On the death of Cardinal Amette in 1916, Cardinal Dubois was made Cardinal Archbishop of Paris. He died at Paris on Sept. 23, 1929.

See his *Mémoires* published in 1929.
DUBOIS, PAUL (1830-1905), French sculptor and painter, was born at Nogent-sur Seine on July 18, 1830, and died on March 22, 1905. After studying at the Ecole des Beaux-Arts, Dubois went to Rome. His first contributions to the Paris Salon (1860) were busts of "The Countess de B" and "A Child." "A Florentine Singer of the Fifteenth Century" was shown in 1865. "The Virgin and Child" appeared in the Paris Universal Exhibition in 1867, from 1873 onwards date the busts of Henner, Dr. Parrot, Paul Baudry, Pasteur, Gounod and Bonnat, remarkable alike for vivacity, likeness, refinement and subtle handling. The chief work of Paul Dubois was "The Tomb of General Lamoricière" in the cathedral of Nantes, a brilliant masterpiece conceived in the Renaissance spirit, with allegorical figures and groups representing Warlike Courage, Charity, Faith and Meekness, with bas-reliefs and enrichments. The statue of the "Constance Anne de Montmorency" was executed for Chantilly, and that of "Joan of Arc" (1889) for the town of Reims. In 1873 Dubois was appointed keeper of the Luxembourg museum. He succeeded Guillaume as director of the Ecole des Beaux-Arts, 1878, and Perraud as member of the Académie des Beaux-Arts.

DUBOIS, PIERRE (c. 1250-c. 1312), French publicist in the reign of Philip the Fair, was educated at the university of Paris. In 1300, he wrote his anonymous *Summa*, *brevis et compendiosa doctrina felici expeditionis et abbreviationis guerrarum et huius regni Francorum*, which is extant in a unique ms., but is analysed by N. de Wailly in the *Bibliothèque de l'école des Chartes* (2nd series, vol. vi). In the context between Philip the Fair and Boniface VIII. Dubois, identified himself with the secularizing policy of Philip. His *Supplication du pape de France au roy contre le pape Boniface le VIII.* printed in 1674 in *Acta inter Bonifacium VIII. et Philippum Patricium*, dates from 1304, and is a heated indictment of the temporal power. He represented

Coutances in the states general of 1302, but in 1306 he was serving Edward I. as an advocate in Guenne, without apparently abandoning his Norman practice by which he had become a rich man. His treatise *De recuperatione terrarum sanctae*, outlining the conditions for a successful crusade, was written in 1306, and dedicated in its extant form to Edward I., though it is certainly addressed to Philip. Dubois's ideas on education, on the clergy of the clergy, and his schemes for the codification of French law, were far in advance of his time. He was an early and violent "Galicen," and the first of the great French lawyers who occupied themselves with high politics. In 1308 he attended the states-general at Tours. He is generally credited with *Quaedam proposita papae a rege super facto Templariorum*, a draft epistle supposed to be addressed to Clement by Philip.

See an article by E. Renan in *Hist. litt. de la France*, vol. xxvi pp. 471-536, P. Dupuy *Hist. de la condamnation des Templiers* (Brussels, 1713), and *Hist. du différend entre le pape Boniface VIII. et Philippe le Bel* (Paris, 1855), and *Notices et extraits de manuscrits*, vol. xx E. Zeck, *Pierre Dubois*, etc. (1917).

DU BOIS, a city of Clearfield county, Pa., U.S., on Sandy Luck creek, 85 mi. N.E. of Pittsburgh. It is on federal highways 119, 219 and 322, and is served by the Baltimore and Ohio and the Pennsylvania railroads and by All American air line. Pop. (1950) 11,466. The city is built on a small plateau surrounded by hills, on the western slope of the Allegheny mountains, nearly 1,400 ft. above sea level. Industrial production includes a gas meter and regulator plant, brewery, electronics and resistor factory, soot blower factory, electric battery works, luggage plant, rubber fabricating plant, automobile spring works, foundry and machine shop and numerous bituminous coal operations in the immediate vicinity. The city was founded in 1872 by John DuBois, and was incorporated in 1881.

DUBOIS-CRANCE, EDMOND LOUIS ALEXIS (1747-1814), French revolutionary, born at Charleville, was elected deputy to the states general in 1789 by the third estate of Vitry le François. At the Constituent assembly, of which he was named secretary in Nov. 1789, he worked for the replacement of the old military system, with its caste distinctions and its mercenaries, by national guards open to all citizens. In his report on Dec. 12, 1789, he adumbrated the idea of conscription. He secured the Assembly's vote that any slave who touched French soil should become free. Elected to the Convention by the department of the Ardennes, he sat among the *Montagnards*. In the trial of Louis XVI. he voted for death without delay or appeal. On Feb. 21, 1793, he was named president of the Convention. He composed a remarkable report on the army, recommending the rapid advancement of the lower officers, and the fusion of the volunteers with the veteran troops. In Aug. 1793 Dubois-Crancé was designated "representative on mission" to the army of the Alps, to direct the siege of Lyons. Accused of lack of energy, he was replaced by G. Couthon (q.v.). On his return he was excluded from the Jacobin club at the instance of Robespierre. He took part in the revolution of 9th Thermidor of the year II, directed against Robespierre. He was one of the committee of five which had to oppose the Royalist insurrection of Vendémiaire (see FRENCH REVOLUTION), and was named a member of the committee of public safety, then much reduced in importance. After the Convention, under the Directory, Dubois-Crancé was a member of the council of the Five Hundred, and was appointed inspector general of infantry, then, in 1799, minister of war. Opposed to the *coup d'état* of the 18th Brumaire, he lived in retirement during the consulate and the empire. He died at Rethel on June 29, 1814.

Among the numerous writings of Dubois-Crancé may be noticed his *Observations sur la constitution militaire, ou bases du travail proposé au comité militaire*. See H. F. T. Jung, *Dubois de Crancé L'armée et la Révolution, 1789-1794* (2 vols. 1884).

DU BOIS-REYMOND, EMIL (1818-1896), German physiologist, was born in Berlin on Nov. 7, 1818. His father belonged to Neuchâtel, his mother was of Huguenot descent, and he spoke of himself as "being of pure Celtic blood." He studied geology at Bonn, then anatomy and physiology at Berlin under Johannes Müller. Du Bois-Reymond's graduation thesis on "Electric Fishes," was the beginning of a long series of investigations

on animal electricity. The results of these inquiries were published in his *Untersuchungen über tierische Elektrizität* (2 vols. 1848–84).

This great work may be regarded under two aspects. On the one hand, it is a record of the exact determination and approximate analysis of the electric phenomena presented by living beings. On the other hand it contains an exposition of a theory. Du Bois Reymond developed the view that a living tissue, such as muscle, might be regarded as composed of a number of electric molecules, of molecules having certain electric properties, and that the electric behaviour of the muscle as a whole in varying circumstances was the outcome of the behaviour of these native electric molecules. This theory has perhaps not stood the test of time so well as have Du Bois Reymond's more simple deductions from observed facts. It was early attacked by Ludimar Hermann, who maintained that a living untouched tissue is not the subject of electric currents so long as it is at rest, is isoelectric in substance, and therefore need not be supposed to be made up of electric molecules, all the electric phenomena which it manifests being due to internal molecular changes associated with activity or injury. Although most subsequent observers ranged themselves on Hermann's side, Du Bois Reymond's theory was of great value, if only as a working hypothesis, and as such it greatly helped in the advance of science.

For many years, Du Bois Reymond exerted a great influence as a teacher. In 1858, upon the death of Johannes Müller, he was given the new chair of physiology at Berlin. In 1851 he was elected to the Academy of Sciences of Berlin, and in 1867 became its perpetual secretary. From 1857 to 1877, he was co-editor of the *Archiv für Anatomie*. His principal work, other than the one on electricity, is *Gesammelte Abhandlungen zur allgemeinen Muskel- und Nervenphysik* (2 vols., 1875–77). He died Nov. 26, 1896. See J. Burdon Sanderson in *Nature* (vol. 19, 1897).

DUBROVNIK (Ital. *Ragusa*), a port of Dalmatia, Yugoslavia. Pop. 18,767. Dubrovnik was known as Ragusa from before the 10th century, but upon its incorporation in the newly-formed state of Yugoslavia in 1918, its name was officially changed to Dubrovnik. The name is commonly thought to be derived from the Slavonic *dubrava*, "woody," though this derivation has been questioned.

It is by far the most picturesque city on the Dalmatian coast, occupying a promontory jutting out into the sea under the bare limestone mass of Mt. Sergio. The seaward fortifications rise directly from the water's edge, while a massive round tower dominates the city on the landward side. Beyond the walls, mostly a double line, which have always been the pride of Dubrovnik, are many villas, surrounded by gardens. The Stradone, or main street, runs along a narrow valley, which until the 13th century was a marshy channel, dividing the Latin island of Ragusa from the forest settlement of Dubrovnik.

Dubrovnik first became prominent during the 7th century. In 639 and 656 the flourishing Latin communities of Salona and Epidaurus were destroyed by the Avars, and the island rock of Ragusa was colonized by the survivors. A colony of Slavs soon joined the Latin settlers at Ragusa, and thus, from an early date, the city formed a link between two great civilizations (see *VLACHES*). During the 9th, 10th, 11th and 12th centuries, Ragusa defended itself against attacks by foreign powers, but from 1205 to 1358 it acknowledged Venetian suzerainty. Ragusan policy during this period was usually peaceful. To refugees of all nations the city afforded asylum, and by means of treaty and tribute it worked its way to a position of great mercantile power. It was conveniently situated at the seaward end of a great trade route, which bifurcated at Plevlje by Byzantium and the Danube. Ragusan trade flourished, both by land throughout the Balkans, and by sea in the Mediterranean region in northern Europe, and in the 16th century, even as far as America and India. From 1358 to 1526, Ragusa was a vassal state of Hungary, but the downfall of Hungary in 1526 left the city free. About this time a great development of art and literature began in the 15th century and continued into the 17th, earned for the city its title of the "South Slavonic Athens." After this period, however, the importance of

Ragusa declined. The conquest of the Balkans by the Turks and the misrule of Hungary in Dalmatia ruined its commerce, and the discovery of America reduced the importance of the Mediterranean ports. In 1667 an earthquake destroyed a considerable portion of the city and about one-fifth of the inhabitants. Only during the Napoleonic wars did the republic regain its prosperity. From 1800 to 1805 it was the sole Mediterranean state remaining neutral, and thus it secured a large share of the carrying trade. In 1805, however, it was seized by the French. Napoleon deprived it of independence and in 1814 it was annexed to Austria. In 1918 it became a part of Yugoslavia and in 1941 it was seized by Italy.

Despite the havoc wrought by the earthquake in 1667 the city is rich in antiquarian interest. One church of the Byzantine period, is mentioned in 13th century documents as being even then of great age. Two 14th century convents stand at the ends of the city, for the Franciscans were set to guard the western gate against the hostile Slavs while the Dominicans kept the eastern one. The Rector's palace is one of the masterpieces of Dalmatian architecture. It has a fine façade of six arches and the capitals of the supporting pillars are curiously carved. One of them bears the figure of Aesculapius, whose tradition of birthplace was nearby Epidaurus whence the Latins migrated in the 7th century to found Ragusa.

The harbour being too small for modern needs and also difficult of approach. Gravosa (Gruz), a village to the N with a good natural harbour became the steamship station and was connected by rail with Dubrovnik. Dubrovnik's industries include the manufacture of liquors, cheeses, silk, leather, drawn thread work, metalwork and soap oil refining and slate mining. Dates, figs, olives, etc. are cultivated. Malmsey, formerly its most famous wine, was not produced after the vine disease of 1852. There is a secondary school and a naval college. The Grotto of Aesculapius is famous for its stlaclites.

LACROMA (Serbo-Croatian *Lokrum*), an island $\frac{1}{2}$ mi. to the S is remarkable for the beauty of its vegetation. It was a favourite resort of the Austrian crown prince Rudolph (1857–89), and of the archduke Maximilian afterwards emperor of Mexico (1832–67), who restored the chateau and park, in which are the ruins of an 11th century Benedictine monastery and a church, locally ascribed to Richard I (1138–99).

See *Lacroma*, by the crown princess Stephanie, afterwards Countess Longay (Vienna, 1892).

DUBS, JAKOB (1822–1879), Swiss statesman, was born on July 26, 1822, at Affoltern, and studied law at Heidelberg, Bern and Zurich. After holding various offices in his native canton, he was elected a member and, in 1857, president of the federal court. He was president of the Swiss confederation in 1864 and in 1868. He died at Lausanne on Jan. 13, 1879. He published *Die Schweizer Demokratie* (1866) and *Das öffentliche Recht der schweizerischen Eidgenossenschaft* (1877).

DUBUQUE, a city of Iowa, U.S.A. on the Mississippi river, opposite the boundary line between Wisconsin and Illinois, a port of entry and the county seat of Dubuque county. It is served by the Burlington, the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific and the Illinois Central railways, and by river steamers and barges.

Pop. (1950) 49,528, (1940) 43,802.

The business section of the city lies on the lowlands along the river, but most of the residential sections are on the slopes and tops of bluffs, which command extensive and picturesque views. Dubuque has a large traffic by rail and by water, and is winter quarters for the boats operating on the upper Mississippi. It is the centre of the state's lead and zinc mines, which were, however, abandoned because of water in 1918. There is a variety of manufacturing industries.

A city-manager government was adopted in 1920. Dubuque is the see of a Roman Catholic archbishop, and is the seat of Loras college for men, formerly Columbia college (established in 1839) and Clarke college for women, formerly Mt. St. Joseph's college (established as an academy in 1843), both Roman Catholic institutions, the University of Dubuque (Presbyterian), the outgrowth

of a school started in 1852 by a Presbyterian minister. Known especially as a German theological seminary from 1864 to 1905, and organized as a university in 1920 and Wartburg seminary. (Lutheran). Twelve miles southwest of the city is a monastery of Trappist monks. Dubuque is the oldest town of Iowa, and until after the Civil War was the largest. In 1788 John Dubuque (1765-1810) settled there, attracted by the lead deposits, which were crudely worked by the Sac and Fox Indians, which he mined until his death. In June 1819, miners from Glen, Ill. attempted to make a settlement, in direct violation of treaties with the Indians, but were driven away by U.S. troops, under orders from Col. Zachary Taylor. White settlers began to come in immediately after the Black Hawk War. A town was laid out under authority of an act of congress (approved July 2, 1836) and in 1817 it was incorporated.

DU CAMP, MAXIME (1822-1894), French writer, was born in Paris. Between 1844 and 1845, and again, in company with Gustave Flaubert, between 1849 and 1851, he travelled in Europe, and the East, and made excellent use of his experiences in books published after his return. In 1851 he was one of the founders of the *Revue de Paris* (suppressed in 1858), and he was a frequent contributor to the *Revue des deux mondes*. He served as a volunteer with Garibaldi in his *Expédition des deux Siciles* (1861). Du Camp's *Souvenirs littéraires* (2 vols., 1882-83) contain much information about contemporary writers, especially Gustave Flaubert, of whom he was an early and intimate friend. Du Camp was one of the earliest amateur photographers, and his many books of travel were among the first photographically illustrated.

DU CANGE, CHARLES DU FRESNE, SIEUX (1610-1688), one of the key members of the great 17th century group of French critics and scholars who laid the foundations of modern historical criticism, was born at Amiens on Dec. 18, 1610. He was educated at the Jesuits' college at Amiens, studied law at Orleans, and afterwards went to Paris, where in 1651 he was received as an advocate before the *parlement*. He had no success at the bar, and soon returned to his native city, where he married and settled. In 1647 he purchased the office of treasurer from his father-in-law. Forced to leave Amiens in 1669 in consequence of a plague, he settled in Paris, where he died Oct. 23, 1688. Of his numerous works the most important are the *Glossarium ad scriptores mediae et infimae latinitatis* (Paris, 1678), and the *Glossarium ad scriptores mediae et infimae graecitatis* (Lyons, 1688), which are indispensable aids to the student of the history and literature of the middle ages.

Du Cange studied the history of the later Roman empire, and wrote *Historia Byzantina duplex commentario illustrata* (Paris 1680), and in introduction to his edition and translation into modern French of Geoffrey de Villehardouin's *Histoire de l'empire de Constantinople sous les empereurs français* (1657). He also brought out editions (1670 and 1686) of the Byzantine historians, John Cinnamus and John Zonaras. His autograph manuscripts in addition to his large and valuable library passed through the hands of many persons before the French Government secured the greater portion of the manuscripts, which were preserved in the imperial library in Paris. Some of these were subsequently published, and the manuscripts are now found in various libraries.

To the three original volumes of the Latin *Glossarium*, three supplementary volumes were added by the Benedictines of St. Maur (Paris, 1733-56), and a further addition of four volumes (1766) by a Benedictine, Pierre Carpenter (1697-1769). There were other editions, and an abridgement with some corrections was brought out by J. C. Adelung (Halle, 1772-84). The edition in seven volumes edited by G. A. L. Henschel (Paris, 1840-50) includes these supplements and also further additions by the editor, and this has been improved and published in ten volumes by Léopold Favre (Nior, 1893-87). An edition of the Greek *Glossarium* was published at Breslau in 1889.

See H. Hardouin, *Essai sur la vie et sur les ouvrages de Ducange* (Amiens, 1849), and L. J. Fougère, in the *Journal de l'instruction publique* (1855).

DUCANGE, VICTOR HENRI JOSEPH BRAHAIN (1783-1833), French novelist and dramatist, was born on Nov. 24, 1783, at The Hague, where his father was secretary to the French embassy. Dismissed from the civil service at the Restoration, Victor Ducange became one of the favourite authors of the

liberal party, and owed some part of his popularity to the fact that he was fined and imprisoned more than once for his outspokenness. He was twice imprisoned for seditious articles in his journal *Le Diable rose, ou le petit courrier de Lucifer* (1822), after the publication of *Théâtre ou l'amour et la guerre* (1823), he took refuge in Belgium. Ducange wrote numerous plays and melodramas including *Marco Lorisio, ou le petit Chouan de 1830* (1832), and *Trente ans, ou la vie d'un joueur* (1837). Many of his books were prohibited, ostensibly for their coarseness, but perhaps rather for their political tendencies. He died in Paris on Oct. 15, 1833.

DUCAS, DUKAS, or DOUKAS, the name of a Byzantine family, which supplied several rulers to the Eastern empire. The family first came into prominence during the 9th century, but was ruined when Constantine Dukas, a son of the general Andronikus Dukas, lost his life in his effort to obtain the imperial crown in 913. Towards the end of the 10th century there appeared another family of Ducas, which was perhaps connected with the earlier family through the female line. A member of this family became emperor as Constantine X. in 1059, and Constantine's son Michael VII. ruled nominally in conjunction with his younger brothers, Andronikus and Constantine, from 1071 to 1078. Michael left a son, Constantine, who married into the family, which was also allied by marriage with other great Byzantine houses, and its members continued to take an active part in public affairs. In 1204 Alexius Dukas, called Mourzoule, deposed the emperor Isaac Angelus and his son Alexius, and vainly tried to defend Constantinople against the attacks of the Latin crusaders. Nearly a century and a half later one Michael Dukas took a leading part in the civil war between the emperors John V. Palaeologus and John VI. Cantacuzenus, and Michael's grandson was the historian Dukas (see below). Many of the petty sovereigns who arose after the destruction of the Eastern empire sought to gain prestige by adding the famous name of Ducas to their own.

DUCAS (15th cent.), Byzantine historian, flourished under Constantine XIII. (XI) Dragases, the last emperor of the East, about 1450. The dates of his birth and death are unknown. He was the grandson of Michael Dukas (see above). After the fall of Constantinople, he was employed in various diplomatic missions by Dornio and Domenico Gattelusio, princes of Lesbos, where he had taken refuge. He survived the annexation of Lesbos in 1462, but no more is known of him. He was the author of a history of the period 1341-1462. Although baroque in style, it is both judicious and trustworthy, and it is the most valuable source for the closing years of the Greek empire and the capture of Constantinople. Ducas was a strong supporter of the union of the Greek and Latin churches, and is very bitter against those who rejected even the idea of appealing to the West for assistance against the Turks.

The history, preserved (without a title) in a single Paris MS., was first edited by I. Bullialdus (Bulliaud) (Paris, 1649), later editions are in the *Bonn Corpus scriptorum Hist. Byz.*, by I. Bekker (1834) and Migne, *Patrologia Graeca*, cxiiv. The Bonn edition contains a 15th century Italian translation by an unknown author, found by L. Ranke in one of the libraries of Venice, and sent by him to Bekker.

DUCASSE, PIERRE EMMANUEL ALBERT, Baron (1813-1893), French historian, was born at Bourges on Nov. 16, 1813. In 1849 he became aide-de-camp to Prince Jerome Bonaparte, ex-king of Westphalia, then governor of the Invalides. He was attached to Jerome's son, Prince Napoleon, during the Crimean War. He was employed by Prince Napoleon on the *Correspondance* of Napoleon I., and afterwards published certain letters, purposely omitted there, in the *Revue historique*. These documents, subsequently collected in *Les Rois frères de Napoléon* (1883), as well as the *Journal de la reine Catherine de Westphalie* (1893), were edited with little care and are not entirely trustworthy, but their publication threw much light on Napoleon I. and his entourage. Ducasse was also employed by Jerome Bonaparte and his son in the compilation of historical accounts of the affairs in which they were concerned.

DUCAT (dōk'at), a coin, generally of gold, and of varying value, formerly in use in many European countries. It was first struck by Roger II. of Sicily as duke of Apulia, and bore an

inscription "Sit tibi, Christi, datum, quem tu regis, iste datus" (Lord, thou rub'st this ducato to thee be it dedicated), hence, it is said, the name. Between 1286 and 1284 Venice also struck a gold coin, known first as the ducat, afterwards as the zecchino or sequin, the ducat becoming merely a money of account. The ducat was also current in Holland, Austria, the Netherlands, Spain and Denmark (cf. MONEY, MEDIAEVAL). A gold coin termed a ducat was current in Hanover during the reigns of George I and George III. A pattern gold coin was also struck by the English mint in 1287 for a proposed decimal coinage. On the reverse was the inscription 'one ducat' within an oak wreath, above "one hundred pence," and below the date between two small roses.

DUCCIO DI BUONINSEGNA (c. 1255-1319), Italian painter of the Sienese School. His father's name was Buoninsegna. We learn some facts regarding Duccio's work from the records of the exchequer of the city of Siena (*Labori d'entrata e uscita di la Biccherna*). In 1278 he was employed as a painter by the commune to decorate *casarii* in which public documents were kept. From 1285 to 1295 he received five commissions to decorate book covers of the Biccherna. He seems therefore to have been a craftsman at the beginning of his career, and his work on book covers may have brought him in touch with Byzantine illuminations.

According to a document in the state archives at Florence (Milanesi, *Documenti* etc., vol. 1 pp. 158-160) he was asked in 1285 to paint a large Madonna for the church of Sta. Maria Novella at Florence. This picture has been identified with the celebrated Rucellai Madonna, long regarded as the work of Cimabue. In 1295 Duccio was consulted as to the site of the Fonte Nova, a Gothic fountain outside the Porta Ovale of Siena, showing that his knowledge was not confined to painting. In 1302 he was paid for a "Madonna enthroned" in the Palazzo Pubblico of Siena, a picture now lost. In 1308 he began work on the great altarpiece for the Siena cathedral, which he undertook to carry out with his own hand. When the work was completed on June 9, 1311, a public holiday was proclaimed, and amid the rejoicing crowds the picture was carried in procession to the cathedral, accompanied by the principal men of the city, and placed over the high altar underneath the cupola. This was the climax of Duccio's career. He died eight years later, on Aug. 3, 1319. His great masterpiece is now preserved in the Opera del Duomo (Cathedral Museum). It adorned a double altar and was painted on both sides. The front represents the "Majestas," the Virgin Enthroned surrounded by angels and saints. The back is made up of small panels representing the life of Christ. Below was a predella, also made up of small panels. Several of these small pictures have been found their way to England. Three are in the National Gallery, London. The four of the Benson Collection were acquired by Duveen, and one of these is now in the Frick Collection, New York. The altarpiece is the one fully authenticated work of the master extant, and represents his later style. The following works are attributed to Duccio for stylistic reasons. To his early period belong, besides the Rucellai Madonna mentioned above, three smaller pictures: the little Madonna with three Ircanians in the Siena Gallery; the Madonna from Count Stroganoff's Collection; and the triptych in the National Gallery representing the Madonna and two saints. These paintings adhere closely to the Byzantine type. In the National Gallery triptych, however, a new influence makes itself felt. Here the gesture of childlike love contrasting with the sad expression in the mother's face is an innovation in Byzantine as well as in Italian art, and marks the direction in which Duccio was to develop. A triptych representing "the Crucifixion" in Buckingham Palace is ascribed to the master's second period. A very fine example of the artist's later period is the Crucifixion in Lord Crawford's collection; this work is contemporary with the altarpiece in the Opera del Duomo. When comparing his later work with his early work, we find a marked advance in the expression of emotion. The figures are inspired with virile energy. Moreover, Gothic features are introduced in the architecture and in the rendering of drapery, trees and animals. Nevertheless the Byzantine formulae are closely adhered to as regards the composition of figures. The harmoniously coloured shapes are arranged in an ex-

pressive, two dimensioned design, contrasting with the plastic conception of form in the work of Giotto, his younger contemporary. We do not know where Duccio learned his art. Both Vasari and Ghiberti agree that he painted in the "Manner greci," and it is thought that he may have derived his training directly from Byzantine sources. He may have aimed at a revival of Byzantine painting at a time when the art of Central Italy was hopelessly degenerated. Though his influence was felt in the general development of Sienese art, he had but one or two direct followers. Segna di Buonaventura and Ugolino da Siena. Meanwhile Giotto carried the whole of Italy with him. Duccio may therefore be called the last and greatest representative of the Byzantine tradition.

Richter: *Lectures on the National Gallery* (1898); J.ington Douglas, *History of Siena* (1902); J. A. Crowe and G. B. Cavalcaselle: *History of Painting in Italy*, ed. 1. Douglas (2nd ed., 1903-14); C. H. Wugclit, *Duccio di Buoninsegna* (1912). (I. A. R.)

DU CHAILL, PAUL BELLONI (1835-1903), traveller and anthropologist, was born, probably in Paris, on July 31, 1835. In his youth he accompanied his father, who was in the African trade, to the west coast of Africa. In 1855 he settled in America, and was commissioned by the Academy of Natural Sciences at Philadelphia to explore the delta of the Ogowe river and the estuary of the Gabon. During his travels he saw numbers of the anthropoid apes, then known to scientists only by a few skeletons. A subsequent expedition, from 1863 to 1865, enabled him to confirm the accounts given by the ancients of a pygmy people inhabiting the African forests. His *Explorations and Adventures in Equatorial Africa* (1861) and *A Journey to Ashango land* (1867) excited much controversy. Du Chaillu's later works are concerned with travel in Sweden and Lapland. He died on April 29, 1903 at St. Petersburg (Leningrad).

DUCHCOV or DUX, a town of Bohemia, situated in the fertile Eger valley near the centre of the Bruck Teplitz lignite field. It has flourishing glass and ceramic industries using local raw materials. Pop. (1930) 12,877. 50% German.

DUCHENNE, GUILLAUME BENJAMIN AMAND (1806-1875), French physician, was born on Sept. 17, 1806, at Boulogne, the son of a sea captain. He was educated at Douai and then studied medicine in Paris until 1831, when he returned to his native town to practise his profession. Two years later he first tried the effect of electro-puncture of the muscles on a patient under his care, and from this time on devoted himself to electro-physiology and neurology, thereby laying the foundation of the modern science of electrotherapeutics. In 1842 he removed to Paris where he worked until his death. His greatest work, *L'Electrisation localisée* (1855), passed through three editions during his lifetime, though by many his *Physiologie des mouvements* (1867) is considered his masterpiece. He published over 50 volumes containing his researches on muscular and nervous diseases, and on the applications of electricity both for diagnostic purposes and for treatment. His name is especially connected with the first description of locomotor ataxia, progressive muscular atrophy, pseudo-hypertrophic paralysis, glossolabio laryngeal paralysis, and other nervous troubles. He died in Paris on Sept. 17, 1875.

For a detailed life see *Archives générales de médecine* (Dec. 1875), and for a list of his works the 3rd ed. of *L'Electrisation localisée* (1872).

DUCHESE (Latinized DUCHENIUS, QUERNEUS, or QUERCETANUS), **ANDRE** (1584-1640), French geographer and historian, generally styled the father of French history. Through the influence of Richelieu, he was appointed historiographer and geographer to the king. He died in Paris on May 30, 1640. Duchesne left behind him more than 100 folio volumes of manuscript extracts now preserved in the Bibliothèque Nationale (L. Delisle, *Le Cabinet des manuscrits de la Bibliothèque impériale*, t. I, 333-334). Several of his larger works were continued by his only son, François du Chesne (1616-93), who succeeded him in the office of his historiographer to the king. The principal work of André Duchesne are *Historiae Normannorum scriptores antiqui* (1619, now the only source for some of the texts), and his *Historiae Francorum*

scriptores (5 vols 1636-49). This last was intended to comprise 24 volumes and to contain all the narrative sources for French history in the middle ages, only two volumes were published by the author, his son François published three more, and the work remained unfinished. Duchesne's other works include *Les antiquités des rois de France* (1609), *Les antiquités de toute la France* (1609), *Histoires des Papes jusqu'à Paul V* (1619).

DUCHESNE, LOUIS MARIE OLIVIER (1843-1922), French scholar and ecclesiastic, was born at St Servan, Brittany, on Sept. 13, 1843. He was educated at the seminary of St Briec and at Rome and was ordained priest in 1867. In 1874 he went on a scientific expedition to Mt Athos and in 1876 to Asia Minor, but his interest in the history of the Western Church appeared in 1877 when he received the degree of *docteur ès lettres* with two remarkable theses, a dissertation *De Macario magne*, and an *Étude sur le Liber pontificalis*, an acute critical study of the origin and editions of that celebrated chronicle. Immediately afterwards he was appointed professor at the Catholic Institute in Paris, and for eight years presented the example, then rare in France, of a priest teaching church history according to the rules of scientific criticism. His course, bold even to the point of rashness in the eyes of the traditionalists, was at length suspended. In Nov. 1885 he was appointed lecturer at the École Pratique des Hautes Études. In 1886 he published vol. 1 of his learned edition of the *Liber pontificalis* (completed in 1892 by vol. II). In 1888 he was elected member of the Académie des Inscriptions et Belles Lettres, and was afterwards appointed director of the French school of archaeology at Rome. Much light is thrown upon the Christian origins, especially those of France, by his *Origines du culte chrétien, étude sur la liturgie latine avant Charlemagne* (1889, Eng. trans. by M. L. McClure, *Christian Worship its Origin and Evolution*, London, 5th ed. 1919), *Mémoire sur l'origine des diocèses épiscopaux dans l'ancienne Gaule* (1890), the preliminary sketch of a more detailed work, *Fastes épiscopaux dans l'ancienne Gaule* (1894-99), and *Catalogues épiscopaux de la province de Tours* (1898). His *Antonomies ecclésiastiques, églises séparées* (1897, Eng. trans. by H. H. Mathew, 1907), in which he speaks of the origin of the Anglican Church, but treats especially of the origin of the Greek Churches of the East, was received with scant favour in certain narrow circles of the pontifical court. In the *Histoire ancienne de l'église*, 4th ed. (1908, Eng. trans. by C. Jenkins, 1909-24) Duchesne touches cleverly upon the most delicate problems, and without any elaborate display of erudition, presents notable conclusions. *L'Eglise au VI^e siècle* was published posthumously in 1925. His incisive style, his fearless and often ruthless criticism, and his wide and penetrating erudition, make him a redoubtable adversary in the field of polemic. The *Bulletin critique*, a review of history, philology and theology, founded by him in 1850, has contributed powerfully to spread the principles of the historical method among the French clergy.

Duchesne received an honorary Litt D from Cambridge and D Litt from Oxford, and in 1910 was elected to the French Academy. He died on April 21, 1922.

See C. D. Habloville, *Grandes Figures de l'Eglise contemporaine—M^r Duchesne* (1925).

DUCCIS, JEAN FRANÇOIS (1733-1816), French dramatist and adapter of Shakespeare, succeeded to the futeuil of Voltaire at the Academy in 1779. His father, originally from Savoy, was a linen-draper at Versailles. In 1768 he produced his first tragedy, *Amélie*. The failure of this first attempt was compensated by the success of his Shakespearean adaptations *Hamlet* (1769), *Roméo et Juliette* (1772), *Le Roi Lear* (1783), *Macbeth* (1783) and *Othello* (1792), which last, supported by the acting of Talma, obtained immense applause. Though actuated by honest admiration of the great English dramatist, Duccis is not Shakespearean. His ignorance of the English language left him at the mercy of the translations of Pierre Letourneur (1726-88) and of Pierre de la Place (1707-93), and even this modified Shakespeare had still to undergo a process of purification and correction before he could be presented to the fastidious criticism of French taste. He did not pretend to reproduce, but to excerpt and re-

fashion, and consequently the French play sometimes differs from its English namesake in everything almost but the name. The plot is different, the characters are different, the motifs different, and the scenic arrangement different. To *Othello*, for instance, he wrote two endings. In one of them Othello was enlightened in time and Desdemona escaped her tragic fate. Of his original works the best were *Œdipe chez Admète* (1778), and *Abufar* (1795).

An edition of his works in three volumes appeared in 1813, *Oeuvres posthumes* were edited by Campenon in 1826, and *Hamlet, Œdipe chez Admète, Macbeth* and *Abufar* are reprinted in vol. II of Didot's *Chefs d'œuvre tragiques*. See Omelette Lacroix, *Étude sur la personne et les écrits de Duccis* (1822) based on Duccis' own memoirs preserved in the library at Versailles, *Saint-Buve Censures du lundi*, t. VI, and *Nouveaux lundis*, t. IV, Vilemain *Tableau de la littérature au XVIII^e siècle*.

DUCK, the English name for birds forming six of the ten subfamilies of the family Anatidae. Technically, duck is restricted to the female, the male being called "drake," and in one species, "mallard."

Ducks comprise (1) the Anatinae or fresh water ducks, (2) the Nyrociniae or diving ducks or sea ducks (see EIDER, GOLDEN EYE, POCHARD, SLAUP, SCOTER), (3) the Oxyurinae or spiny-tailed ducks, (4) the Mergatinniae or torrent ducks, (5) the Merginae or mergansers (q.v.), (6) the Dendrocygninae or long-legged tropical tree ducks.

The Anatinae are the typical group and the only ones here considered. The mallard (*Anas platyrhynchos*) is the most plentiful and best known species, and is the origin of the domestic breeds of Europe and the USA. It inhabits the northern hemisphere, reaching Panamá, Egypt and N.W. India in winter, and the Arctic circle in summer. The nest may be on the ground or in a hole in a tree, 9 to 11 pale green eggs are laid on a lining of down which the mother pulls from her breast. As soon as the young hatch out, the mother takes them to the nearest piece of water. The male may guard the nest before hatching, but takes no interest in the brood and, indeed, is incapable of rendering active assistance by reason of an additional moult that deprives him of power of flight until the autumn. In hard weather, the ducks resort to tidal waters. For the domestic breeds of duck see POULTRY and POULTRY FARMING. It is an interesting point that, whereas the male wild duck is monogamous, the domesticated drake is polygamous.

About 75 species of Anatinae are distributed throughout the world, some confined to small oceanic islands. Males are usually colourful, females duller, but both are dull in some like the American black duck (*A. rubripes*). Close to mallards are the pintail and the garganey (q.v.) and related teals (q.v.). Allied genera include shovellers (q.v.), gadwalls (q.v.), widgeons (q.v.), sheldrakes (q.v.), the gorgeous Asiatic Mandarin (*Dendrocygna garrulata*) and North American wood duck (*A. sponsa*) and musk duck (*Cairina*).

DUCK, a plain fabric, made originally from tow yarns. The cloth is lighter than canvas or sailcloth, and differs from these in that it is almost invariably single in both warp and weft. The term is also used to indicate the colour obtained at a certain stage in the bleaching of flax yarns, it is a colour between half-white and cream. Most of the flax ducks (tow yarns) appear in this colour, although quantities are bleached or dyed. Some of the ducks are made from long flax, dyed black, and used for kitbags, while the dyed tow ducks may be used for inferior purposes. The fabric, in its various qualities and colours, is used for an enormous variety of purposes, including tents, wagon and motor hoods, light sails, clothing workmen's overalls, bicycle tubes, mail and other bags and pocketings. *Russian duck* is a fine white linen canvas. The term is probably derived from the Dutch *doek*, a coarse linen material.

DUCKING and **CUCKING STOOLS**, chairs used for the punishment of scolds, witches and prostitutes in bygone days. The two have been confused, but are distinct. The earlier, the cucking stool or stool of repentance, is of very ancient date, and was used by the Saxons, who called it the *Scalding* or *Scolding Stool*. Seated on this stool the woman, her head and feet bare, was publicly exposed at her door or paraded through the streets amidst the jeers of the crowd. The cucking stool was used for

both sexes, and was specially the punishment for dishonest brewers and bakers. The earliest record of the use of the ducking stool is towards the beginning of the 17th century. It was a strongly made wooden armchair in which the culprit was seated, an iron band being placed around her so that she should not fall out during her immersion. The chair was fastened to a long wooden beam fixed as a scullow on the edge of a pond or river. Sometimes, however, the ducking stool was not a fixture, but was mounted on a pair of wooden wheels so that it could be wheeled through the streets. In sentencing a woman the magistrates ordered the number of duckings she should have. Yet another type of ducking stool was a chair on two wheels with two long shifts fixed to the sides. This was pushed into the pond and the shifts released thus tipping the chair up backwards. Ducking stools were used in England as late as the beginning of the 19th century.

See W. Andrews, *Old Time Punishments* (Hull, 1890); A. M. Ertle, *Curious Punishments of Bygone Days* (Chicago, 1886); W. C. Hazlett, *Faiths and Folklore* (London, 1905); Llewellyn Jewett in *The Reliquary*, vols. 1 and 2 (1860-62); *Gentleman's Magazine* for 1732.

DUCKWEED, the common botanical name for species of *Lemna* (family *Lemnaceae*) which form a green coating on fresh water ponds and ditches. The plants are of extremely simple structure and are the smallest and least differentiated of flowering plants. They consist of a so-called "frond"—a flattened green more or less oval structure which emits branches similar to itself from lateral pockets at or near the base. From the under surface a root with a well developed sheath grows downwards into the water. The flowers which are rarely found in Britain, are developed in one of the lateral pockets. The inflorescence is very simple, consisting of one or two male flowers each comprising a single stamen, and a female flower comprising a flask-shaped pistil. The family to which they belong is regarded as representing a very reduced type perhaps allied to the Araceae.

Besides *Lemna*, other genera representative of the family are *Spirodela*, with several roots, and *Wolffia* and *Wolffiella*, with no roots. In Great Britain three species of *Lemna* occur, the lesser duckweed (*L. minor*), the gibbous duckweed (*L. gibba*), and the ivy leaved duckweed (*L. trisulca*), the greater duckweed (*Spirodela polyrrhiza*) is also found. All the foregoing are distributed widely throughout the world. In Great Britain the family is further represented by *Wolffia arrhiza*, in which the rootless fronds are only $\frac{1}{16}$ in long, it is the smallest of British flowering plants. In North America eight duckweeds occur, including all those found in Great Britain, there are also three species each of *Wolffia* and *Wolffiella*. *Wolffia punctata*, with fronds only $\frac{1}{16}$ in to $\frac{1}{8}$ in long, is one of the most minute of all flowering plants.

DUCKWORTH, SIR JOHN THOMAS (1748-1817), British admiral, was born at Leatherhead, Surrey, on Feb. 28, 1748, and entered the navy in 1759. He shared in the three days' naval engagement in which the British fleet was defeated (June 1, 1794), and received a gold medal and the thanks of parliament. In March 1807 he was the naval commander of the combined force which reduced the islands of St. Bartholomew and St. Martin, a service for which he was rewarded with the Order

of the Bath and a pension of £1,000 a year. Promoted to be vice admiral of the blue, he was appointed in 1804 to the Jamaica station. Two years later, while cruising off Cadiz with Lord Collingwood, he was detached with his squadron to pursue a French fleet that had been sent to the relief of Santo Domingo. He came up with the enemy on Feb. 6, 1806, and, after two hours' fighting, inflicted a signal defeat, capturing three of their five vessels and stranding the other two. In 1807 he was again sent to the Mediterranean to watch the movements of the Turks. In command of the "Royal George" he forced the passage of the Dardanelles, but sustained considerable loss on his return. In 1815 he was appointed to the chief command at Plymouth, which he held until his death on April 14, 1817.

See *Naval Chronicle*, xviii, *Railie's Naval Biography*, ii.
DUCLAUX, AGNES MARY FRANCES (1857-), English poet and critic (see Robinson), was born at Leamington on Feb. 27, 1857. In 1888 she married James Darmesteter (q.v.), and in 1901, after his death, Emile Duclaux, director of the Pasteur Institute. She published several volumes of poetry, including *A Handful of Honeysuckle* (1878), *The New Arcadia and other Poems* (1884), *An Italian Garden* (1886), *Collected Poems, Lyric and Narrative* (1902), and *The Return to Nature, Songs and Symbols* (1904).

Madame Duclaux's best known prose works are a monograph on *Emily Brontë* (1883), *The Life of Emily Brontë* (1897), *The End of the Middle Ages* (1888), "Froussart" (1894) in the *Grands écrivains français*, *Le d'Emile Duclaux* (1907), *Madame de Sévigné* (1914), *La Pensée de Robert Browning* (1922) and *A Portrait of Pascal* (1927).

DUCOS, PIERRE ROGER (1747-1816), French politician, was born at Dav. Despite his lack of ability, he ascended the highest rungs of the political ladder from the day when he became member of the council of the Five Hundred serving successively as a director, consul and vice president of the Senate. He abandoned Napoleon in 1814, but was himself exiled in 1816. He died at Ulm in March 1816.

DUCTLESS GLANDS, in anatomy, glands in the body having no ducts or canals for conveying away their products, which, known as internal secretions, pass directly into the veins or lymphatics. Among these structures are the *spleen*, *adrenals*, *thyroid gland*, *parathyroids*, *thymus* and the *carotid and coeliacal* bodies. In addition lymphatic glands are described under lymph.

DUCKWEED (*LEMNA MINOR*) OR DUCK MEAT SHOWING THE FLAT BLADE LIKE FROND AND FLOWER WHICH FLOAT ON THE WATER ALLOWING THE ROOTS TO HANG LOOSELY.

FIG. 1—THE SPLEEN. VISCERAL ASPECT.

phatic system (q.v.), and pineal and pituitary bodies under brain, (q.v.).

THE SPLEEN

The human *spleen* is an oval, flattened gland, of a dull purple colour, and about 5 in long by three broad, situated in the upper and back part of the left side of the abdominal cavity. The external surface is convex to adapt it to the concavity of the diaphragm, against the posterior part of which it lies, external to the diaphragm is the pleural cavity, and more externally still, the ninth, tenth and eleventh ribs. The internal surface is divided by

a prominent ridge into a gastric or anterior and a renal or posterior surface. Probably, the shape of the spleen varies somewhat from time to time. The gastric surface is concave to fit the fundus of the stomach, while just in front of the ridge separating the gastric and renal surface is the hilum, where the vessels enter and leave the organ. The renal surface is moulded on to the upper part of the outer border of the left kidney and just reaches the left adrenal body. The borders of the spleen usually show two or more notches. The whole spleen is surrounded by peritoneum, which is reflected off on to the stomach and the kidney. Small accessory spleens are fairly often found in the neighbourhood though, possibly, some of these may be haemo lymph glands (see LYMPHATIC SYSTEM).

Microscopically the spleen has a fibro-elastic coat in which involuntary muscle is found (fig. 2). This coat sends fine trabeculae into the organ subdividing it into minute compartments, in which the red highly vascular spleen pulp is contained. This pulp contains small spherical masses of adenoid tissue (Malpighian corpuscles), situated on the terminal branches of the splenic blood vessels, numerous red blood corpuscles, lymphocytes and endothelial cells, the last often containing pigment granules or fat. The arteries in large part open into spaces, which give origin to the veins.

Embryology—The spleen is developed in the dorsal mesogastrium (see COELOM AND SEROUS MEMBRANES) from the mesenchyme, or (not portion of the mesoderm) the cells of which lie scattered in a matrix. Large lymphoid cells are early seen among those of the mesenchyme, probably being derived from the coelomic epithelium. The network of the spleen seems certainly to be derived from cells of the mesenchyme which lose their nuclei.

Comparative Anatomy—The spleen is regarded as the remains of a mass of lymphoid tissue which, in a generalized type of vertebrate, stretched all along the alimentary canal. It is absent as a distinct gland in the Arthropoda and Cyclostomata. In the fishes it is closely applied to the U-shaped stomach, and in some of the Elasmobranchs, e.g., the basking and porbeagle sharks it is divided into small lobules. In Protoperans (Dipnoi) it is enclosed within the walls of the stomach. In frogs and toads (Amphibia) it is a spherical mass close to the rectum, and is derived from a different part of the original mass, already mentioned to that which persists in other vertebrates. In the *Iguana* (Reptilia) the organ has many notches, each corresponding to the point of entrance of a vessel. In mammals the notches when present also frequently correspond to the points of entrance of arteries at the hilum. The Monotremata and Marsupialia have curious Y-shaped spleens. As a rule flesh-eating animals have larger and more notched spleens than vegetable feeders, though among the Cetacea the spleen is relatively very small.

ADRENAL GLANDS

The adrenal glands or suprarenal capsules are two conical bodies, flattened from before backward, resting on the upper poles of the kidneys close to the sides of the vertebral column; each has a concave base which is in contact with the kidney. On the anterior surface is a transverse sulcus or hilum from which a large vein emerges. The arteries are less constant in their points of entry. The glands are entirely retroperitoneal. In a vertical transverse section each gland is seen to consist of two parts, cortical (yellow) and medullary (red). The cortical substance is composed of columns of cells, separated by a stroma. The medullary part consists of small islets of cells, which resemble columnar epithelium lying among venous sinuses, these cells are in close connection with the sympathetic nerve filaments from the great splanchnic plexus.

Embryology—The generally accepted view is that the cortical substance is derived from the coelomic epithelium covering the mesoderm of the upper (cephalic) portion of the Wolffian body and corresponds to the nephrostomes of mesonephridial tubules (see URINARY SYSTEM), while the medullary part grows out from the sympathetic ganglia and is so probably ectodermal in origin. In the early human embryo the adrenals are larger than the kidneys and at birth they are proportionately much larger than in the adult.

Comparative Anatomy—Adrenals are unknown in Amphioxus and the Dipnoi. In the Cyclostomata (hags and lampreys) they are said by some to arise in connection with the cephalic part of the pronephros, though other writers deny their presence altogether. In the Elasmobranchs and Holoccephali the medullary and cortical parts are apparently distinct, the former being represented by a series of organs situated close to the intercostal arteries, while the latter may be either median or paired, and, be-

FIG. 2—SECTION OF SPLEEN UNDER LOW MAGNIFICATION SHOWING FIBRO-ELASTIC COVERING, BLOOD VESSELS AND VARIOUS CORPUSCLES.

ing placed between the kidneys, are often spoken of as interrenal. In the Amphibia the glands are sunk into the surface of the kidney. In reptiles and birds they are long lobulated bodies lying close to the testis or ovary. In the lower mammals they are not as closely connected with the kidney as they are in man, and their shape is usually oval or spherical.

THE THYROID GLAND

The thyroid body or gland is a deep red glandular mass consisting of two lobes which lie on each side of the upper part of the trachea and lower part of the larynx; these are joined across the middle line by the isthmus which lies in front of the second and third rings of the trachea. The gland is relatively larger in women and children than in men. It is enclosed in a capsule of cervical fascia and is supplied by the superior and inferior thyroid arteries. Microscopically, the gland consists of closed tubular alveoli filled with colloid material, and lined by cuboidal epithelial cells supported by a basement membrane. The lymphatic vessels are large and numerous, and contain the same colloid as the alveoli. Accessory thyroids close to the main gland, are often found.

Embryology—The median part of the gland is developed from the thyroglossal duct which grows down in the middle line from the junction of the buccal and pharyngeal parts of the tongue (q.v.), between the first and second branchial arches. The development of the hyoid bone obliterates the middle part of the duct, leaving its upper part as the foramen caecum of the tongue, while its lower part bifurcates. The lateral parts of the gland are developed from the endoderm of the fourth visceral clefts, and, joining the median part, lose their pharyngeal connection.

Comparative Anatomy—The endostyle, or hypobranchial groove of Tunicata and Acrania is regarded as the first appearance of the median thyroid, this is a median endodermal groove in the floor of the pharynx, secreting a glairy fluid in which food particles become entangled and so pass into the intestine. In the larval lamprey the connection with the pharynx is present, but in the adult as in all adult vertebrates, this connection is lost. In Elasmobranchs the single median thyroid lies close to the mandibular symphysis, but in Teleostei it is paired. In Dipnoi there is also an indication of a division into two lobes. In Amphibia the thyroid forms numerous vesicles close to the anterior end of the pericardium. In Reptilia it lies close to the trachea, and in Chelonians and Crocodilia is paired. In birds it is also paired and lies near the origin of the carotid arteries. In Mammalia the lateral

lobes make their first appearance. In the lower orders of this class the isthmus is often absent.

PARATHYROID GLANDS

These little oval bodies are, two on each side. The upper pair is embedded in the thyroid at the level of the lower border of the cricoid cartilage, while the lower pair may be embedded in the lateral lobes of the thyroid or lie below in relation to the inferior thyroid veins. They are often very difficult to find in the adult. Microscopically they consist of solid masses of epithelioid cells with numerous blood vessels, while, embedded in their periphery, are often masses of thymic tissue including the concentric corpuscles of Hassall. They are developed from the entoderm of the third and fourth branchial grooves.

Parathyroids have been found in the orders of Primates, Chiroptera, Carnivora, Ungulata and Rodentia among the Mammalia, and also in birds. In the other classes of vertebrates little is known of them.

THE THYMUS GLAND

The thymus is a light pink gland, consisting of two unequal lobes, which lies in front of the pericardium and great vessels, it also extends up into the root of the neck to within a short distance of the thyroid gland. It continues to grow until the second year of life after which it remains stationary until puberty, when it usually atrophies and is represented by a mass of fat. Each lobe is divided up by areolar tissue, and, microscopically, the lobules consist of a cortical and medullary part. The cortex resembles in structure a lymphatic gland (*see LYMPHATIC SYSTEM*). In the medulla the lymphoid cells are fewer, and nests of epithelial cells are found (concentric corpuscles of Hassall). The vascular supply is derived from all the vessels in the neighbourhood, the lymphatics are very large and numerous, but the nerves, which come from the sympathetic and vagus, are few and small.

Embryology.—The thymus is formed from a diverticulum, on each side, from the entoderm lining the third branchial groove, but the connection with the pharynx is soon lost. The lymphoid cells and concentric corpuscles are probably derived from the original cells lining the diverticulum.

Comparative Anatomy.

The thymus is always a paired gland. In most fishes it rises from the dorsal part of all five branchial clefts, in Lepidostren (Dipnoi), from all except the first, in Urodela from third, fourth and fifth, and in Anura from the second only. In all fishes, including the Dipnoi, it is placed dorsally to the gill arches on each side. In Amphibia it is close to the articulation of the mandible. In Reptilia it lies along the carotid artery, but in young crocodiles it is lobulated and extends all along the neck, as it does in birds lying close to the side of the oesophagus. In mammals the Marsupials are remarkable for having a well developed cervical as well as thoracic thymus. In some of the lower mammals the gland does not disappear as early as it does in man.

CAROTID BODIES

These are two small bodies situated between the origins of the external and internal carotid arteries. Microscopically they are divided into nodules or cell balls by connective tissue, and these closely resemble the structure of the parathyroids, but are without any thymic tissue. The blood-vessels in their interior are large and numerous. It is believed that they are part of the sympathetic system.

COCCYGEAL BODY

This is a median body, the size of a pea, situated in front of the apex of the coccyx and between the insertions of the levatores ani muscles. It resembles the crotoid body in its microscopical structure, but is not so vascular. Concentric corpuscles, like those of the thymus have been recorded in it. Of its embryology and comparative anatomy little is known. Probably it is sympathetic in origin. (For further information *see* ENDOCRINOLOGY.)

DUDELL, WILLIAM DU BOIS (1872–1917), British electrical engineer, was born in 1872. Because of his delicate health Duddell was educated at Cannes and as a child he showed signs of great mechanical ingenuity. He served his apprenticeship as an engineer at Colchester. In 1893, he went to the City and Guilds Institute, where he stayed for some years because of the facilities for experimental work. Later he had an office of his own in Victoria street, London. Duddell showed an extraordinary gift for designing and constructing apparatus. His first and probably his most notable instrument was the Duddell galvanometer or oscillograph (*see* INSTRUMENTS, ELECTRICAL). While carrying out observations on the resistance of the electric arc, the results of which were published in the *Proceedings of the Royal Society* (1901), he discovered the 'singing arc,' which led eventually to the development of the Poulsen arc. In connection with this work he designed and constructed a mechanical high frequency alternator giving 100,000 cycles per sec. Duddell also designed a thermoammeter (*see* INSTRUMENTS, ELECTRICAL), which he used in his work on radio telegraphy. He was F.R.S. and held office in several learned societies. Duddell died on Nov. 4, 1917.

DUDERSTADT, town, Prussian province of Hanover, Germany, situated in a beautiful and fertile valley (formerly called *Goldene Mark*) watered by the Hahle and on the railway Wulfsen-Lünefelde. Population 6,950. Duderstadt was founded by Henry I. (the Fowler) in 920, passed later to the monastery of Quedlinburg, and then to Brunswick. It was a member of the Hanseatic League, and during the Thirty Years' War became a stronghold of the Imperialists. It was taken by Duke William of Weimar in 1632, in 1761 its walls were dismantled, and it passed finally in 1866 with Hanover to Prussia. It is an interesting mediaeval town with many ancient buildings. There are two beautiful Gothic churches of the 14th century. It makes gloves, hats, paper, cigars and bricks, it has also a trade in singing birds.

DUDEVANT, A. L. A. *see* SAND, GEORGE.

DUDLEY, BARONS AND EARLS OF. The holders of these English titles are descended from John de Sutton (c. 1310–59) of Dudley Castle, Staffordshire, who was summoned to parliament as a baron in 1342. Sutton was the son of another John de Sutton, who had inherited Dudley Castle through his marriage with Margaret, sister and heiress of John de Soinery (d. 1321), he was called Lord Dudley, or Lord Sutton of Dudley, the latter being doubtless the correct form. However, his descendants, the Suttons, were often called by the name of Dudley, and from John Dudley of Atherington, Sussex, a younger son of John Sutton, the 5th baron, the earls of Warwick and the earl of Leicester of the Dudley family are descended.

John Sutton or Dudley (c. 1400–87), the 5th baron, was first summoned to parliament in 1440, having been viceroy of Ireland from 1428 to 1430. He died on Sept. 30, 1487. He was succeeded as 6th baron by his grandson Edward (c. 1459–1532), and one of his sons, William Dudley, was bishop of Durham from 1476 until his death in 1483. His descendant Edward Sutton or Dudley, the 9th baron (1567–1643), had several illegitimate sons. Among them was Dud Dudley (1599–1684), who in 1665 published *Metalum Martis*, describing a process of making iron with "pit-coale, sea coale, etc." which was put in operation at his father's ironworks at Pensnet, Worcestershire, of which he was manager. During the Civil War he was a colonel in the army of Charles I. Dying without lawful male issue in June 1643, the 9th baron was succeeded in the barony by his grand-daughter, Frances.

FROM CUNNINGHAM "TEXTBOOK OF ANATOMY" (OXFORD UNIVERSITY PRESS).

FIG. 3.—RIGHT AND LEFT SUPRARENAL BODIES SHOWING THE ANTERIOR SURFACES.

(1611-97), she married Humble Ward (c. 1614-70), the son of a London goldsmith, who was created Baron Ward of Birmingham in 1642. Their son Edward (1641-1701) succeeded both to the barony of Dudley and to that of Ward but these were separated when his grandson William died unmarried in May 1740. The barony of Dudley passed to a nephew, Ferdinand Dudley Lea, falling into abeyance on his death in Oct. 1757, that of Ward passed to the heir male, John Ward (d. 1774), a descendant of Humble Ward. In 1761 Ward was created Viscount Dudley, and in April 1821 his grandson John William Ward (1781-1831), foreign minister in 1827-28, became the 4th viscount. He was created Viscount Edmunt and earl of Dudley in 1827, and when he died unmarried on March 6, 1833, these titles became extinct. His barony of Ward, however, passed to William Humble Ward (1781-1835), whose son, William (1817-85) was created Viscount Edmunt and earl of Dudley in 1860. The 2nd earl of Dudley in this creation was the latter's son William Humble (b. 1866), who was lord lieutenant of Ireland from 1902 to 1906, and governor general of Australia from 1908 to 1911. He died in 1932.

See H. S. Grazebrook in *Herald and Genealogist*, vols. 11, v and vi, in *Notes and Queries*, 2nd series, vol. vi, and in vol. ix of the publications of the William Salt Society (1888).

DUDLEY, EDMUND (c. 1462-1510), minister of Henry VII of England, was a son of John Dudley of Atherington, Sussex, and a member of the great baronial family of Sutton or Dudley. After studying at Oxford and at Gray's Inn, Dudley came under the notice of Henry VII. He and his colleague Sir Richard Empson (q.v.) are called *fiscals indices* by Polydore Vergil, and their extortions made them bitterly hated. Dudley, who was speaker of the House of Commons in 1504, amassed a great amount of wealth for himself, and possessed large estates in Sussex, Dorset and Lincolnshire. When Henry VII died in April 1509, he was thrown into prison by order of Henry VIII and charged with the crime of constructive treason, being found guilty and attainted. He was executed on Aug. 17 or 18, 1510. Dudley's nominal crime was that during the last illness of Henry VII he had ordered his friends to assemble in arms in case the king died, but the real reason for his death was the unpopularity caused by his avarice. During his imprisonment he sought to gain the favour of Henry VIII by writing a treatise in support of absolute monarchy called *The Tree of Commonwealth* (printed privately, in Manchester 1859).

See Francis Bacon, *History of Henry VII*, edit. J. R. Lumby (1881), and J. S. Brewer, *The Reign of Henry VIII*, edit. J. Gardner (1884).

DUDLEY, SIR ROBERT (1573-1649), titular duke of Northumberland and earl of Warwick, English explorer, engineer and author, was the son of Robert Dudley, earl of Leicester (q.v.), the favourite of Queen Elizabeth. His mother was Lady Douglas Sheffield, daughter of Thomas, first Baron Howard of Effingham. Leicester, who deserted Lady Douglas Sheffield for Lettice Knollys, widow of the first earl of Essex, denied that they were married. Her son Robert was born in May 1573, was recognized by Leicester, and sent to Christ Church, Oxford, in 1587. He inherited all Leicester's property under the earl's will at his death in 1588, and in the following year the property of Ambrose Dudley, earl of Warwick. In 1594 he made a voyage to the West Indies, and in 1596 he took part in the expedition to Cadiz and was knighted. After the death of Elizabeth he endeavoured to secure recognition of his legitimacy, and of his right to inherit the titles of his father and uncle. The proceedings were quashed by the Star Chamber. In 1605 he obtained leave to travel abroad, and went to Italy accompanied by the beautiful Miss Elizabeth Southwell, daughter of Sir Robert Southwell of Woodrising, in the dress of a page. When ordered to return home and to provide for his deserted wife and family, he refused, was outlawed, and his property was confiscated. On the continent he avowed himself a Roman Catholic, married Elizabeth Southwell at Lyons, and entered the service of Cosimo II, grand duke of Tuscany. He was employed in draining the marshes behind Leghorn, and in the construction of the port. In Italy Dudley was known as Duca di Nortombria and Conte di Warwick. He died near Florence on

Sept. 6, 1649. His deserted wife, Alicia, was created duchess of Dudley by Charles I. in 1644, and died in 1670, when the title became extinct. Dudley's chief claim to remembrance is the magnificent *Arcano del mare* (Florence, 3 vols. 1645-1646; reprinted 2 vols. 1661), a collection of all the naval knowledge of the age, remarkable for a scheme for the construction of a navy in five rats which Dudley designed and described.

See G. L. Craik *Romance of the Peacocks* (London, 1848-1850), vol. 11. See N. H. Nicolas *Report of Proceedings on the Claim to the Barony of Lisle* (London, 1829), and *The Italian Biography of Sir R. Dudley*, by Doctor Vaughan Thomas.

DUDLEY, THOMAS (1576-1653), British colonial governor of Massachusetts, was born in Northampton, England, in 1576, possibly a member of the elder branch of the family to which Robert Dudley, earl of Leicester, belonged. He was the son of a country gentleman of some means and high standing, was captain of an English company in the French expedition of 1597, serving under Henry of Navarre, and eventually became the steward of the earl of Lincoln's estates, which he managed with great success for many years. Having been converted to Puritanism, he became an advocate of its strictest tenets. About 1627 he associated himself with other Lincolnshire gentlemen who in 1629 entered into an agreement to settle in New England provided they were allowed to take the charter with them. This proposal the general court of the Plymouth Company agreed to, and in April 1630 Dudley sailed to America in the same ship with John Winthrop, the newly appointed governor. Dudley himself at the last moment being chosen deputy governor in place of John Humphrey (or Humphrey), the earl of Lincoln's son in law, whose departure was delayed. Dudley was for many years the most influential man in the Massachusetts Bay Colony, save Winthrop, with whose policy he was more often opposed than in agreement. He was deputy governor in 1629-34, in 1637-40, in 1646-50 and in 1651-53, and was governor four times, in 1634, 1640, 1645 and 1650. Soon after his arrival in the colony he settled at Newton (Cambridge), of which he was one of the founders, he was also one of the earliest promoters of the plan for the establishment of Harvard college. Winthrop's decision to make Boston the capital instead of Newton precipitated the first of the many quarrels between the two, Dudley's sterner and harsher Puritanism, being in strong contrast to Winthrop's more tolerant and liberal views. He was an earnest and persistent heresy hunter—not only the Antinomians, but even such a good Puritan as John Cotton, against whom he brought charges, feeling the weight of his stern and remorseless hand. His position he himself best expressed in the following brief verse found among his papers—

Let men of God in courts and churches watch
O'er such as do a Toleration hatch,
Lest that ill egg bring forth a Cockatrice
To poison all with heresy and vice.

He died at Roxbury, Mass., on July 31, 1653.

See Augustine Jones, *Life and Work of Thomas Dudley*, *The Second Governor of Massachusetts* (1890), and *The Life of Mr. Thomas Dudley, several times Governor of the Colony of Massachusetts*, written as it is supposed by Cotton Mather, edited by Charles Deane (1870). Dudley's interesting and valuable "Letter to the Countess of Lincoln," is reprinted in Alexander Young's *Chronicles of the Planters of the Colony of Massachusetts Bay* (1846), and in the New Hampshire Historical Society *Collections*, vol. 19 (1834), G. K. Kouss, *Thomas Dudley, Governor of Massachusetts* (Boston, 1914).

His son JOSEPH DUDLEY (1647-1720), colonial governor of Massachusetts, was born in Roxbury, Mass., on Sept. 23, 1647. He graduated at Harvard college in 1665, became a member of the general court, and in 1682 was sent by Massachusetts to London to prevent the threatened revocation of his charter by Charles II. There, with an eye to his personal advancement, he secretly advised the king to annul the charter, this was done, and Dudley, by royal appointment, became president of the provisional council. With the advent of the new governor, Sir Edmund Andros, Dudley became a judge of the superior court and censor of the press. Upon the deposition of Andros, Dudley was imprisoned and sent with him to England, but was soon set free. In 1691-92 he was chief-justice of New York, presiding

over the court that condemned Leisler and Milbain. Returning to England in 1695, he was lieutenant governor of the Isle of Wight and a member of parliament, and in 1700, after a long intrigue, secured from Queen Anne a commission as governor of Massachusetts serving until 1715. His administration was marked particularly in the earlier years, by ceaseless conflict with the general court, from which he demanded a regular fixed salary instead of an annual grant. He was active in raising volunteers for the so-called Queen Anne's War. He was accused by the Boston merchants, who petitioned for his removal, of being in league with smugglers and illicit traders, and in 1708 a bitter attack on his administration was published in London entitled *The Deplorable State of New England by reason of a Covetous and Treacherous Governor and Pusillanimous Councillors*. His character may be best summed up in the words of one of his successors, Thomas Hutchinson, that 'he had as many virtues as can consist with so great a thirst for honour and power.' He died at Roxbury on April 2, 1720.

See Everett Kimball, *The Public Life of Joseph Dudley* (1911), J. G. Palgrave, *History of New England*, vol. IV (1875), and the *Massachusetts Historical Society, Collections*, series 5, vol. VI (1879).

Joseph Dudley's son, PAUL DUDLEY (1675-1751), graduated at Harvard in 1690, studied law at the Temple in London, and became attorney general of Massachusetts (1702-18). He was associate justice of the superior court of that province from 1718 to 1745, and chief justice from 1745 until his death. He was a member of the Royal Society (London), to whose *Transactions* he contributed several valuable papers on the natural history of New England, and was the founder of the Dudleyan lectures on religion at Harvard.

DUDLEY, market town, county and parliamentary borough, Worcestershire, England, in a portion of that county enclosed in Staffordshire, 8 mi NW of Birmingham and 12 mi NW of London by the LMS Ry, also served by the GW Ry, and on the Birmingham and Stourbridge canals. Pop. (1938) 61,600. Area 6 sq mi. Dudley stands on a ridge in the Black Country, in which are ironworks and coal mines. The "ten yard" coal, in the neighbourhood, is the thickest seam worked in England. Limestone, for burning, and dolomite, for road metal, are extensively quarried, while iron and brass foundries and engineering and brickworks are the chief industries. The principal buildings are the churches of the six parishes of the town, the council house (1935), the town hall (1928), county court, free libraries, grammar school, girls' school, technical school, teachers' training college, the Guest hospital (founded by Joseph Guest 1868) and a dispensary. The town is noted for the excellent Silurian fossils obtained from the limestone quarries of Dudley Castle and Wren's Nest. To the north of the town, on Dudley Castle hill, are extensive remains of an ancient castle, surrounded by beautiful grounds open to the public. The view from the castle is remarkable. The whole district is seen to be set with chimneys, pit-buildings and factories, and at night the glare of furnaces reveals the tireless activity of the Black Country. Dudley and its environs are connected by a bus system.

Brierley Hill, urban district and market town, 2½ mi SW of Dudley, on the GW Ry, in Kingswinford parliamentary division, Staffordshire, and on the river Stour and the Stourbridge and Birmingham canals, is an important industrial centre, producing coal, fire clay and glass. Pop. (1938) 46,360. Between here and Dudley are the ironworks of Round Oak and Netherton, a suburb of Dudley. Three miles west of Dudley is Kingswinford (in Brierley Hill urban district), a mining township, with large brickworks, giving name to a parliamentary division of Staffordshire. The parliamentary borough of Dudley returns one member.

In mediaeval times, Dudley (*Dudeles*) depended on the castle, which is mentioned in the Domesday Survey. Before the Conquest Earl Eadwine held the manor, which in 1086 belonged to William FitzAnsculf, from whom it passed to Fulk Paynel, afterwards to the Somersy Suttons and Wards, and their descendants, the present earls of Dudley. The first mention of Dudley as a borough occurs in an inquisition taken after the death of Roger de

Somery in 1272. In 1865 Dudley was incorporated. Before that time it was governed by a high and low bailiff, appointed every year at the court leet of the manor. Roger de Somery evidently held a market by prescription in Dudley before 1261, in which year he came to terms with the dean of Wolverhampton, who had set up a market in Wolverhampton. According to the terms of the agreement the dean might continue his market on condition that Roger and his tenants should be free from toll there. Two fairs, on Sept. 21 and April 21, were granted in 1684 to Edward Lord Ward, lord of the manor. Dudley was represented in the parliament of 1295, but not again until the Reform Act of 1832. Mines of 567 coal in Dudley are mentioned as early as the reign of Edward I, and by the beginning of the 17th century mining had become an important industry.

DUDO or **DUDON** (*fl.* c. 1000), Norman historian, was dean of St. Quentin, where he was born about 965. Sent in 986 by Albert I. count of Vermandois, on an errand to Richard I., duke of Normandy, he spent some years in that country. During a second stay in Normandy Dudo wrote his history of the Normans, a task which Duke Richard I. had urged him to undertake. Very little else is known about his life, except that he died before 1043. Written between 1015 and 1030, his *Historia Normannorum*, or *Libri III de moribus et actis primorum Normanniae ducum*, was dedicated to Adalberon, bishop of Laon. Dudo appears to have obtained his information from oral tradition, much of it being supplied by Roul, count of Ivry, a half-brother of Duke Richard I. Consequently the *Historia* partakes of the nature of a romance, nevertheless, J. Lair and J. Steenstrup, while admitting the existence of a legendary element, regard the book as of considerable value for the history of the Normans. The *Historia*, which is written alternately in prose and in verse of several metres, is divided into four parts, and deals with the history of the Normans from 852 to the death of Duke Richard I. in 996. It was largely used by William of Jumièges, Wace, Robert of Torigni, William of Poitiers and Hugh of Fleury in compiling their chronicles, and was first published by A. Duchesne in his *Historiae Normannorum scriptores antiqui*, at Paris in 1619. Another edition is in the *Patrologia Latina*, tome cxi of J. P. Migne (Paris, 1844), but the best is perhaps the one edited by J. Lair (Caen, 1883).

Waitz, "Über die Quellen zur Geschichte der Begründung der normannischen Herrschaft in Frankreich," in the *Göttinger gel. Anzeigen* (Göttingen, 1866), J. C. H. R. Steenstrup, *Normannerne*, Band I (Copenhagen, 1876), J. Lair, *Étude critique et historique sur Dudo* (Caen, 1886), G. Kortum, *Über die Quellen des Roman de Rou* (Leipzig, 1869), W. Wattenbach, *Deutschlands Geschichtsquellen*, Band I (Berlin, 1904), and A. Molmer, *Les Sources de l'histoire de France*, tome II (Paris, 1902).

DUDWEILER, a town of the Saar district of Germany, on the Sulzbach, 4 mi by rail N.E. from Saarbrücken. It has extensive coal mines and ironworks and produces fireproof bricks. Pop. (1939) 25,061.

DUEL. A prearranged encounter between two persons, with deadly weapons, in accordance with conventional rules, with the object of voiding a personal quarrel or of deciding a point of honour. The first recorded instance of the word occurs in Coryate's *Crudities* (1611), but Shakespeare has *duello* in this sense, and uses "duellist" of Tybalt in *Romeo and Juliet*. In its earlier meaning of a judicial combat we find the word latinized in the Statute of Wales (Edw. I., Act 12), "*Placita de terris in partibus suis non habent terminari per duellum*". The word *duello* is from Ital. *duello*, Lat. *duellum*—old form of *bellum*—from *duo*, two.

Duels in the modern sense were unknown to the ancient world, and their origin must be sought in the feudal age of Europe. The single combats recorded in Greek and Roman history and legend, of Hector and Achilles, Aeneas and Turnus, the Horatii and Curiatii, were incidents in national wars and have nothing in common with the modern duel.

It is, however, noteworthy that in Tacitus (*Germania*, cap. x) we find the rudiments of the judicial duel. Domestic differences, he tells us, were settled by a legalized form of combat

between the disputants, and when a war was impending a captive from the hostile tribe was armed and pitted against a national champion, and the issue of the duel was accepted as an omen. The judicial combat was a Teutonic institution, and it was in fact an appeal from human justice to the God of battles partly a sanction of the current creed that might is right, that the brave not only will win but deserve to win. It was on these grounds that Gundobald justified against the complaints of a bishop, the famous edict passed at Lyons (A.D. 501) which established the wager of battle as a recognized form of trial. It is God, he argued, who directs the issue of national wars, and in private quarrels we may trust His providence to favour the juster cause. Thus, as Gibbon comments, the absurd and cruel practice of judicial duels, which had been peculiar to some tribes of Germany, was propagated and established in all the monarchies of Europe from Sicily to the Baltic. Yet in its defence it may be urged that it abolished a worse evil, the compurgation by oath which put a premium on perjury, and the ordeal, or judgment of God, when the cause was decided by blind chance, or more often by priest-craft.

The Judicial Combat—Those who are curious to observe the formalities and legal rules of a judicial combat will find them described at length in the 28th book of Montesquieu's *Esprit des lois*. On these regulations he well remarks that, as there are an infinity of wise things conducted in a very foolish manner, so there are some foolish things conducted in a very wise manner. For our present purpose it is sufficient to observe the development of the idea of personal honour from which the modern duel directly sprang. In the ancient laws of the Swedes we find that if any man shall say to another, "You are not a man equal to other men," or "You have not the heart of a man," and the other shall reply "I am a man as good as you," they shall meet on the highway, and then follow the regulations for the combat. What is this but the modern challenge? By the law of the Lombards if one man call another *erga*, the insulted party might defy the other to mortal combat. What is *erga* but the *dimmer Junger* of the German student? Beaumanoir thus describes a legal process under Louis le Debonnaire. The appellant begins by a declaration before the judge that the appellee is guilty of a certain crime, if the appellee answers that his accuser lies, the judge then ordains the duel.

From Germany the judicial combat rapidly spread to France, where it flourished greatly from the 10th to the 12th century, the period of customary law. By French kings it was welcomed as a limitation of the judicial powers of their half-independent vassals. It was a form of trial open to all freemen and in certain cases, as under Louis VI, the privilege was extended to serfs. Even the Church resorted to it not infrequently to settle disputes concerning church property. Abbots and priors as territorial lords and high justiciaries had their share in the confiscated goods of the defeated combatant, and Pope Nicholas when applied to in 858 pronounced it "a just and legitimate combat." Yet only three years before the council of Valence had condemned the practice, imposing the severest penance on the victor and refusing the last rites of the church to the vanquished as to a squire.

Under Louis XII and Francis I we find the beginnings of tribunals of honour. The last instance of a duel authorized by the magistrates, and conducted according to the forms of law, was the famous one between François de Vivonne de la Châtaignerie and Guy Chabot de Jarnac. The duel was fought on July 10, 1547, in the courtyard of the château of St. Germain en Laye, in the presence of the king and a large assembly of courtiers. It was memorable in two ways. It enriched the French language with a new phrase, a sly and unforeseen blow, such as that by which de Jarnac worsted La Châtaignerie, has since been called a *coup de Jarnac*. And Henry, grieved at the death of his favourite, swore a solemn oath that he would never again permit a duel to be fought. This led to the first of the many royal edicts against duelling. By a decree of the council of Trent (1564) a ban was laid on "the detestable use of duels, an invention of the devil to compass the destruction of souls together with a bloody death

of the body."

Trial by Battle in England—In England, it is now generally agreed, the wager of battle did not exist before the time of the Norman Conquest. Some previous examples have been adduced, but on examination they will be seen to belong rather to the class of single combats between the champions of two opposing armies. By the laws of William the Conqueror the trial by battle was only compulsory when the opposite parties were both Normans, in other cases it was optional. As the two nations were gradually merged into one, this form of trial spread, and until the reign of Henry II it was the only mode for determining a suit for the recovery of land. The method of procedure is admirably described by Shakespeare in the opening scene in *Richard II*, where Henry of Bolingbroke, duke of Hereford, challenges Thomas, duke of Norfolk, in the mock-heroic battle between Horner the Armourer and his man Peter in *Henry VI*, and by Sir W. Scott in the *Fair Maid of Perth*, where Henry Gow appears before the king as the champion of Magdalen Proudfoot.

The judicial duel never took root in England as it did in France. In civil suits it was superseded by the grand assize of Henry II, and in the cases of felony by indictment at the prosecution of the crown. One of the latest instances occurred in the reign of Elizabeth, 1571, when the lists were actually prepared and the justices of the common pleas appeared at Tottenham Fields as umpires of the combat. Fortunately the petitioners failed to put in an appearance, and was consequently non-suited (see *Spelman Glossary*, s.v. "Campus"). As late as 1817 Lord Ellenborough, in the case of *Thorton v. Ashford*, pronounced that "the general law of the land is that there shall be a trial by battle in cases of appeal unless the party brings himself within some of the exceptions." Thorton was accused of murdering Mary Ashford, and claimed his right to challenge the appellant, the brother of the murdered girl, to wager of battle. His suit was allowed, and, the challenge being refused, the accused escaped. Next year the law was abolished (19 Geo. III., c. 46).

The Duel of Honour.—We are justified, then, in dating the commencement of duelling from the abolition of the wager of battle. The causes which made it indigenous to France are sufficiently explained by the condition of society and the national character. As Buckle has pointed out, duelling is a special development of chivalry, and chivalry is one of the phases of the protective spirit which was predominant in France up to the time of the Revolution. The third chapter of d'Audiguer's *Ancien usage des duels* is headed, "Pourquoi les seuls Français se battent en duel." English literature abounds with allusions to this characteristic of the French nation. Lord Herbert of Chesham, who was ambassador at the court of Louis XIII, says, "There is scarce a Frenchman worth looking on who has not killed his man in a duel."

Duels were not common before the 16th century. Hallam attributes their prevalence to the barbarous custom of wearing swords as a part of domestic dress, a fashion which was not introduced till the latter part of the 15th century. In 1500 the states general at Orleans supplicated Charles IX to put a stop to duelling. Hence the famous ordinance of 1566, drawn up by the chancellor de l'Hôpital, which served as the basis of the successive ordinances of the following kings. Under the frivolous and sanguinary reign of Henry III, "who was as eager for excitement as a woman," the rage for duels spread till it became almost an epidemic. In 1602 the combined remonstrances of the church and the magistrates extorted from the king an edict condemning to death whoever should give or accept a challenge or act as second. But public opinion was revolted by such rigour, and the statute was a dead letter. Fontenay-Mareuil says, in his *Mémoires*, that in the eight years between 1601 and 1609, 2,000 men of noble birth fell in duels. In 1609 a more effective measure was taken at the instance of Sully by the establishment of a court of honour. The edict decrees that all aggrieved persons shall address themselves to the king, either directly or through the medium of the constables, marshals, etc., that the king shall decide, whether, if an accommodation could not be effected, permission to fight should be given, and that anyone who kills

his adversary in an unauthorized duel shall suffer death without burial. Henri Martin has declared this "the wisest decree of the old monarchy on a matter which involves so many delicate and profound questions of morals, politics, and religion touching civil rights" (*Histoire de France*, x 466).

"Who is to Fight to-day?"—In the succeeding reign the drama for duels revived. Rostand's *Cyrano* is a life like modern portraiture of French bloods in the first half of the 17th century. De Houssey tells us that in Paris when friends met, the first question was, "Who fought yesterday? who is to fight today?" They fought by night and day, by moonlight and by torch light, in the public streets and squares. A hasty word, a misconceived gesture, a question about the colour of a ribbon or an embroidered letter, such were the commonest pretexts for a duel. The slighter and more frivolous the dispute, the less were they inclined to submit them to the king for adjudication. Often, like gladiators or prize fighters, they fought for the pure love of fighting. A misunderstanding is cleared up on the ground. "N'importe," cry the principals, "poussez nous sommes ici, battons nous." Seconds, as Montaigne tells us, are no longer witnesses but must take part themselves unless they would be thought wanting in affection or courage, and he goes on to complain that men are no longer contented with a single second, "c'était anciennement des duels, ce sont à cette heure rencontres et batailles." There is no more striking instance of Richelieu's firmness and power as a statesman than his conduct in the matter of duelling. In his *Testament politique* he has assigned his reasons for disapproving it as a statesman and ecclesiastic. But this disapproval was turned to active detestation by a private cause. His elder brother, the head of the house, had fallen in a duel stabbed to the heart by an enemy of the cardinal. Already four edicts had been published under Louis XIII with little or no effect, when in 1626 there was published a new edict condemning to death any one who had killed his adversary in a duel, or had been found guilty of sending a challenge a second time. Banishment and partial confiscation of goods were awarded for lesser offences. But this edict differed from preceding ones not so much in its severity as in the fact that it was the first which was actually enforced. The cardinal began by imposing the penalties of banishment and fines, but, these proving ineffectual to stay the evil, he determined to make a terrible example. To quote his own words to the king, "Il s'agit de couper la gorge aux duels ou aux écus de votre Majesté." The count de Bouteville, a renegade who had already been engaged in 21 affairs of honour, determined out of pure bravado to fight a 22nd time. The duel took place at midday on the Place Royale. Bouteville was arrested with his second, the count de Chapelles, they were tried by the parlement of Paris, condemned and, in spite of all the influence of the powerful house of Montmorency, of which de Bouteville was a branch, they were both beheaded on June 27, 1627. For a short time the ardour of duellists was cooled.

Duels Under Louis XIV.—Under the long reign of Louis XIV many celebrated duels took place, of which the most remarkable were that between the duke of Guise and Count Coligny, the last fought on the Place Royale, and that between the dukes of Beaufort and Nemours, each attended by four friends. Of the ten combatants, Nemours and two others were killed on the spot, and none escaped without some wound. No less than 11 edicts against duelling were issued under le Grand Monarque. That of 1643 established a supreme court of honour composed of the marshals of France, but the most famous was that of 1679, which confirmed the enactments of his predecessors, Henry IV and Louis XIII.

The subsequent history of duelling in France may be more shortly treated. In the preamble to the edict of 1704 Louis XIV records his satisfaction at seeing under his reign an almost entire cessation of those fatal combats which by the myriads of force or custom had so long prevailed. Addison (*Spectator*, 99) notes it as one of the most glorious exploits of his reign to have banished the false point of honour. Under the regency of Louis XV there was a brief revival. The last legislative act for the suppression of duels was passed on April 12, 1723. Then came the Revolution
